Names of rivers, lakes, books, places, the sun, and all abstract nouns are feminine, e.g.:—

Ka wah, river.
Ka nam, lake.
Ka Bibay, book.
Ka shillong, shillong.
Ka engi, sun
Ka jingmarong, advice.

The article *i* is used either as a diminutive, as *i khadlong*, a fairy, or for denoting endearment, as *i mei*, mother.

Number.—*U*, *ka*, and *i* stand for the singular number, e.g. *u khla* (a tiger), *ka khah* (a Khasi basket), *i khun* (a child). *Ki* is the sign of the plural, as *ki nam*, the stones. *Ki* in most few instances is used honorifically, as *ki Siem*, the king, *ki khnar*, the father-in-law.

Cases are eight in number, and are denoted by prefixes. The declension of the noun *lum* (hill) is given below by way of example:—

	Singular.	Plural.
Nominative . .	*u lum*	*ki lum.*
Accusative . .	*ca u lum*	*ca ki lum.*
Instrumental . .	*da u lum*	*da ki lum.*
Dative . .	*ca, ka, or sha u lum*	*ca, ka, or sha ki lum.*
Ablative . .	*ca u lum*	*ca ki lum.*
Genitive . .	*jong u lum*	*jong ki lum.*
Locative . .	*ka u lum*	*ka ki lum.*
Vocative . .	*ka lum*	*ka phi ki lum.*

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

193

The sign of the genitive case, *jong*, is sometimes omitted for the sake of brevity, e.g. *u kwer ope* (my dog) for *u kwer jong ope*. The preposition *la* gives also the force of the possessive case, e.g. *la ka jong ka jong* (their own). There are some nouns which change their form, or rather are abbreviated when used in the vocative case, e.g. *ka mei*, not *ka kmei* = Oh mother; *ka pa*, not *ka kpa* = Oh father. These, however, are all of them nouns showing relationships.

Pronouns.—Personal pronouns are *ope* (I), *ngi* (we), *ma* (thou, masculine), *pha* (thou, feminine), *phi*, you (masculine or feminine), *u* (he, it), *ka* (she, it), *i* (diminutive form of *u* or *ka*), and *ki* (they).

The emphatic form of the personal pronoun is formed by postfixing *ne*, e.g. *ma-ope*, *ma-u*, after a verb, but not after a preposition, e.g. *dei-ma-ope* = it is I. But *ei in ma ope* is an [illegible]

The *Reflexive Pronoun* is formed by the word *lade* (self) being suffixed to the personal pronoun, as *u leh swin in lade* = he does himself harm, or by the addition of the word *hi* (self) to the personal pronoun, as *phi hi phi ong* (you yourself).

The Relative Pronoun is formed by the suffix *ka*, added to any of the personal pronouns, as *haba*, *uba*, *hiba* (who, which).

The Demonstrative Pronoun is formed by the addition of the particles denoting the position of things with reference to the speaker, e.g. (1) near = this, *ne* (*u-ne*, *hane*, *i-ne*, *ki-ne*); (2) in sight, but further off = that, *to* (*uto*, &c.); (3) further away, but still visible = that *tai* (*u-tai*, &c.); (4) out of sight or only contemplated in the mind = that, *ta* (*u-ta*, &c.); (5) above = that, *tei* (*u-tei*, &c.); (6) below = this, *thi* (*ka-thi*, &c.); *katai-tai*, *katei-tei*, *kathi-thi* point to an object at a great distance but within sight.

The Interrogative Pronoun is the article followed by *no* or *ei* (e.g. *u-no*, *hano*, who), *u-ei*, *ka-ei* (who, which). *Ei* is often used without the "article," and *no* (which is restricted to persons) when declined, regularly drops the "article," e.g. *jong-no* whose? *ia-no*, whom? *sha-no*, to whom? What? neuter, is *eiad*, and also *kei*.

Adjectives are formed by prefixing *ka* to the root, thus *kha* goodness; *ka-kha*, good; *swin*, badness; *ka-swin*, bad. When

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

193 *ba* is dropped, the word is no longer an adjective but a verb, and in some cases a noun, e.g. *uba khraw* (adj.) = big, great; *u khraw* = he becomes great. An adjective may be formed without any of the prefixes *ba*, *uba*, &c., e.g. *ka mian-tuh* = a thieving cat.

An adjective follows the noun it qualifies, and agrees with the noun it qualifies in gender and number.

Comparison.—The comparative is formed by adding *kham* before an adjective, followed by *ban ia* (than), or simply *ia*, and the *superlative* by adding such adverbs of intensity as *tam*, *ch*, *ch than*, *tam ch*, *chikaddei*, which are followed generally by *ia* or *ban ia*.

Numerals.—In Khasi the cardinal number always precedes the noun (e.g. *kai sis*, three times). The following are the first ten numerals.

[802]

1. *Wei.*	6. *Hinrin.*
2. *Ar.*	7. *Hinnien.*
3. *Iai.*	8. *Phra.*
4. *Sap.*	9. *Khyndai.*
5. *Sam.*	10. *Shiphen.*

The word *khad* is prefixed for forming the numerals from 11 to 19, e.g. *khad-wei*, *khad-ar*, eleven, twelve, &c.

The verbal root (which never varies) may be simple or compound. The compound roots are (1) causals, formed by prefixing *pyn* to the simple root: as *iap*, die; *pyniap*, kill. (2) Frequentatives, formed by prefixing *iai*; as *iam*, weep; *iai iam*, weep continually. (3) *Inceptives*, by prefixing *man*; as *stad*, be wise; *manstad*, grow wise. (4) *Reciprocals*, by prefixing *ia*; as *ieit*, love; *ia-ieit*, love one another. (5) *Intensives*, by prefixing the particle *lyn*, *lyn*, *syn*, *tyn*. Any noun or adjective may be treated as a verbal root by means of a prefix of these five classes. Thus *kejia*, a quarrel (Hindustani loan word, *gazia*;) *ia kejia*, to quarrel with one another; *kynta*, share; *pyn-ia-kynta* (reciprocal causal), to divide between several persons. It should be mentioned with reference to the second class or frequentative verbs, that they sometimes take the prefixes, or particles as Roberts prefers to call them, *dem*, *dup*, *nang*, *shait*, *kaw* in place of *iai*, e.g. *dem-man*, to come after; *dup-teh*, to practise; *nang-wad*, to go on searching; *shait pang*, to be always ill; *kaw-kaw*, to be in the habit of devouring. There are two

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

verbs for "to be," *long*, implying existence absolutely, and *don*, implying limited existence, and also meaning "to have." There is only one form of conjugation for all verbs. Tense and mood are indicated by prefixes, number and person by the subject. When the subject is a noun the pronoun is inserted before the verb. The following is the conjugation of the verb "to be" in the present, past, and future tenses :—

Present.		Past.		Future.	
Singular.	Plural.	Singular.	Plural.	Singular.	Plural.
1	2	3	4	5	6
Nga long I am	*Ngi long* We are	*Nga la long* I was	*Ngi la long* We were	*Ngan long* I shall be	*Ngin long* We shall be
Me (masc.) or *phi* (fem.) *long* Thou art	*Phi long* Ye are	*Me* or *phi la long* Thou wast	*Phi la long* Ye were	*Man* or *phan long* Thou shalt be	*Phin long* You shall be
U (masc.) or *ka* (fem.) *long* He or she is	*Ki long* They are	*U* or *ka la long* He or she was	*Ki la long* They were	*U'n* or *ka'n long* He or she will be	*Kin long* They will be

The above simple tenses are made definite or emphatic by various means. *La*, sign of the past, when added to *lah*, sign of the potential, has the sense of the pluperfect, e.g. *nga la lah long*, I had been. *Yn* abbreviated into *'n* emphasizes the future, the particle *sa* also indicates the future; *da* is the usual sign of the subjunctive mood, *lada*, *la*, *lymda*, *tad*, *yada*, *ban*, *da* are other signs of this mood. The sign of the infinitive is *ba'a*. The imperative is either (1) the simple root, or (2) the root compounded with some word such as *to*.

Participles.—The present participle is formed by prefixing *ba* to the root, e.g. *ba long*, being. The imperfect participle is formed by prefixing such words as *ba u*, *ka da*, *da kaba*, &c. The perfect participle is formed by putting such particles as *ba la*, *kaba la*, *da kaba la* before the verb. Verbal nouns of agency are formed by prefixing *nong* to the root, e.g. *u nong knia* (the sacrificer). The *Passive Voice* is formed by using the verb impersonally, and putting the subject into the Accusative case with *ia*.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

193 *Potentiality* is indicated by the verb *lah*, necessity by the verb *dei*; *dang* and *da* show the indefinite present.

The *negative* is indicated by the particles *ym*, contracted into *'m*, *shym*, and *pat*. *Ym* is put before the verb, e.g. *'ym don briew* = there is no one; with a pronoun it is contracted, e.g. *u'm wan*, he does not come. It follows the sign of the future, e.g *phi'n y'm wan*, you will not come. *Shym* and *pat* are negative particles, and are used with *negative verbs* in the past tense, e.g. *u'm shymla wan*, he did not come.

The use of the word "jing."—One of the most striking features of the language is the use of the word *jing*, which is employed to create a verbal noun out of a verb: for instance, take the verb *bam*, to eat; if we prefix *jing* we have *jingbam*, food. *Bat*, to hold; *jing-bat*, a handle. The use of the word *nong* has already been noticed under the heading "verbs." As an example of another common prefix, it may again be mentioned here. Thus, *nong-ai-jingbam* means a table servant, literally, one who gives food. Again, *nong-bat*, a holder, literally, one who holds.

Syntax.—The order of words in the sentence is usually (1) subject, (2) verb, and (3) object, in fact, the same as in English, and in this respect it differs entirely from the order in the languages derived from Sanskrit, and that of the languages of the Thibeto-Burman group, as far as I have been able to ascertain. For instance, in the Kachari or Boro language the order in the sentence is (1) subject, (2) object, (3) verb. In Khasi when emphasis is needed, however, the object occasionally precedes the verb, e.g. *ia u soh u la die*, he has sold the fruit, literally, the fruit he has sold. As stated before, adjectives follow the nouns they qualify, e.g. *u lum bajyrong*, a high mountain, literally, the hill that is high. Interrogative adverbs may either precede or follow the verb e.g. *naei phi wan*, or *phi wan naei*, where do you come from?

No account of the Khasi language would be complete without some reference to the adverbs which are so very numerous in Khasi. U Nissor Singh, in his admirable little book of "Hints on the Study of the Khasi Language," writes, "Adverbs are so numerous in the Khasi language that I shall not attempt to enumerate them all in this small book. Many of the adverbs,

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

indeed, belong to the untranslatables of the language. We are never in want of a specific term to express the appropriate degree of any quality." To learn how to use the right adverb at the right time is one of the niceties of the language. There is a peculiarity about some of the adverbs of place which should be mentioned: e.g. *Hangto*, there (within sight); *hangne*, here; *hangta*, there (out of sight); *hangtai*, there (at some distance); *hangtei*, there (upwards); *hangthi*, there (downwards); also the interrogative adverbs *hangno*, *nangno*, whence, contain the inherent root *nga*, and it seems possible that this *nga* is the first personal pronoun I. If this is so, *hangto* would mean literally "to me there," *hangthi* "to me down there," and similarly *nangno*, *nangne* would mean "from where to me there" and "from there to me here." 193

Adverbs generally follow the words they modify, as *u'n leit mynta*=he will go now, but there are exceptions to the above rule, such as interrogative adverbs. The following come before those they modify: *tang shu*, *la dang* (as soon as, when); *kham*, *shait* (used to, ever); *pat* or *put* (yet); and *shym* (not); but *shuh* (more) goes last. Adverbs of past time are formed by prefixing *myn*, e.g. *mynhynne*, a short time ago. Adverbs of future time are formed by prefixing *la*. The particles *man*, *man la*, and *hala* denote repetition.

The Khasis are exceedingly fond of using double words* which add much to the finish and polish of a sentence. Old people especially have a predilection this way. It is one of the great difficulties of the language to learn how to use such double words correctly. The following are some examples:— [195] 193 192

NOUNS.

kajain ka nep	cloth.
ka kot ka sla	paper.
ka lynti ka syngking	road.
ka ling ka sem	house.
u babu, u phabu	babu.
u tymen u san	elder.
ka stih, ka wait	arms (lit.: shield and sword).
u badon ba em	a well to do person.
ka spah ka phew	wealth.
u kha-u-man	a relation on the father's side.

VERBS.

pynsuk-pynsain	to comfort.
ia shoh ia dat	to scuffle.

* Khasi *ktin kynnoh*.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

193
192

Verbs.

byrngem-byrsit	to threaten.
shepting-shepsmiej	to be afraid.
ihthuh-ihthaw	to be familiar.
kyrpad-kyrpon	to beg.
ia lum-ia lang	to assemble.

Adjectives.

basniw-basmeh	bad.
basmat-basting	active.
donbor-donsor	powerful.
don burom-don surom	noble.
bakhraw-batri	pertaining to a noble family.
baduk-basuk	poor, needy.
babok-basot	righteous.
bariwbha-riwmiat	wealthy.

Adverbs.

hur-hur	delicately.
hain-hain	brilliantly (red).
prum-prum, prem-prem	prominently.
rymbiaw-rymbsoin	shrinkingly.
nior-nior, niur-niur	shakily.
ior-ior, iar-iar	weakly.
parum-pareh	many.
sip-sip, sap-sap	having no taste.

The Mikirs appear to have borrowed a small portion of their vocabulary from the Khasis. The following are quoted as examples of possible common roots:—

	Mikir.	Khasi.
belly	*pòk*	*kpoh.*
strike (v.)	*chòk*	*shoh.*
father	*po*	*kpa.*
come (v.)	*càng*	*wain.*
rice beer	*hor*	*hiar.*
maternal uncle	*nī-lur*	*kni.*

197 The Lyngam dialect differs so much from the standard Khasi that some remarks regarding the former will not be out of place. Dr. Grierson, on pages 17 to 19 of his Volume II. of the "Linguistic Survey of India," has indicated some of these differences, which may be recapitulated here as follows. Some of the commonest verbs vary considerably from those used in
197 the standard dialect. There are also many minor differences of pronunciation. A man is *u breo*, not *u briew*, a son is a *u khon*,
193 not *u khun*. Standard *ng* is often represented by *nj*. Thus
194 *doinj* for *ding*, fire. A final *h* often appears as *k*, and an initial *b* as *p*. Thus, *baroh* (Standard), all, becomes in Lyngam *prok*.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Standard *ei* becomes *aw*. Thus *wei*=*waw*, one; *dei*=*daw*, be necessary. The articles are frequently omitted. The pronoun *u* is used for the plural as well as the singular, instead of the Standard plural *ki*. The diminutive *i* is used with inanimate nouns. This is also sometimes the case in the Standard form.

Nouns.—The prefix of the Accusative-dative is *se* or *sa*, often contracted to *s'* instead of *ia* (Standard). The prefix of the Dative is *hanam, hnam*, or *tnam*. The Standard Dative-locative prefix *ha* is also used, and may be spelt *he* or *hy*. *Ta* or *te* are also found. For the genitive, besides the Standard *jong*, are found *ba, am-ba, am*, and *am-nam*. *Am-nam* and *am* also mean "from."

The plural sometimes takes the suffix *met*.

Adjectives.—The usual word for male is *korang*, and for "female" *konthaw*, in place of the Standard *shynrang* and *kynthei* respectively. The following are examples of comparisons:—*Re-myrriang*, good; *Mai-myrriang*, better; *U re-myrriang*, best. The Standard *tam* is also used for the superlative.

Pronouns.—The Personal Pronouns are:—

	Singular	Plural
1st Person,	*ne*	*biaw, iaw.*
2nd Person,	*mi, mei*	*phiaw.*
3rd Person,	*u, ju, u-ju*	*kiw.*

The Nominative of the pronoun of the second person singular is given once as *ba-mi*, and once as *ma-mi*. The *ma* or *ba* is the Standard emphatic prefix *ma*.

Demonstrative Pronouns appear to be *be, tei* that, and *uni*, or *nih*, this. *Be* is used as a definite article in the phrase *be jawmai*, the earthquake.

The Relative Pronoun is *u-lah*, who.

Interrogative Pronouns are *net, u-iet*, who? and *met*, what?

Verbs.—The pronoun which is the subject of a verb may either precede or follow it. Thus *ne rip*, I strike; *rip biaw*, we strike. The words meaning to be are *re, im*, and *meit* in addition to the Standard *long*. Like the Standard *don, im*, corresponding to Synteng *em*, also means to have. As in the

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

193 Standard, the Present Tense is formed by using the bare root.

The Past Tense is formed in one of five ways, viz.:—

1. By suffixing *let*, as in *ong-let*, said.
2. By suffixing lah-let, as in *dih-lah-let*, went.
3. By prefixing *lah*, and suffixing *let*, as in *lah-ong-let*, said.
4. By prefixing lah, as in *lah-kyllei*, asked.
5. By prefixing *yu* (*yag*, *ym*), as in *yu-nai*, gave; *yag-kheit*, shook; *yu-pait*, broke; *yu-jai*, fell.

The Future is formed in a very peculiar way. The Standard *yu* is inserted into the middle of the root, immediately after the first consonant. Thus *rip*, strike; *ryuip*, will strike. If the root is a compound, it is inserted between the two members, as in *pau-yu-sop*, will fill. Here observe that the Standard causative prefix *pyn* becomes *pan* in Lynngam. The Infinitive has the same form as the Future.

Dr. Grierson points out the following most noteworthy fact with reference to the formation of the Lynngam Future and Infinitive, i.e. that similar infixes occur in Malay, in the Nancowry dialect of Nicobar, and the Malacca aboriginal languages.

The prefix of the Imperative is *nei*, as in *nei-ai*, give; *nei-lam*, bring. The usual negative particle is *ji*, which is suffixed, e.g. *nam-ji* is not.

NUMERALS.

802
192

LYNNGAM	STANDARD (KHASI).
1. *Wei, shi*	*Wei, shi.*
2. *Ar-re* or *a-re*	*Ar.*
3. *Lai-re*	*Lai.*
4. *Saw-re*	*Saw.*
5. *San-de*	*San.*
6. *Hyrrew-re*	*Hiarie.*
7. *Hyanju-re*	*Hinniew.*
8. *Phra-re*	*Phra.*
9. *Khondai-re*	*Khyndai.*
10. *Shi-phu*	*Shi-phew.*

The peculiarity about the Lynngam numerals is the suffix *re*, and the numeral "five" *de*. None of the other dialects of Khasi possess this peculiarity. Dr. Grierson's Volume may be

192

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

193 *A brief note on the Khasi language.*—It is not intended here to give a description of other than what occur to me to be same of the more prominent characteristics of the language.

The article.—There are four articles in Khasi; three in the singular, *u* (masculine), *ka* (feminine), and *i* (diminutive of both genders), and one in the plural for both genders, *ki*.

All Khasi nouns take the article as in French—the great majority of inanimate nouns are feminine and all abstract nouns. The sun (day), *ka sngi*, is feminine, the moon (month), *u b'nai*, is masculine. Sometimes the word varies in meaning according to the gender: *u ngap*, a bee *i jap*, honey.

Genders.—Names of mountains, stones, plants, fruits, stars, the moon are masculine, *e.g*:—

U kyllang, the Kyllang rock.
U mawlein, quartz.
U phan, potato.
U soh niamtra, orange.
U 'lur shai, the morning star.
U' tiw kulap, rose.
U b'nai, the moon.

Names of rivers, lakes, books, places, the sun, and all abstract nouns are feminine, *e.g.* :—

Ka wah, river.
Ka nan, lake.
Ka kitap, book.
Ka Shillong, Shillong.
Ka sngi, sun.
Ka jingsneng, advice.

The article *i* is used either as a diminutive, as *i khunlung*, a baby, or for denoting endearment, as *i mei*, mother.

Number—*u*, *ka* and *i* stand for the singular number. *Ki* is the sign of the pural, e.g., *u khla* (a tiger), *ka khoh* (a Khasi basket), *i khun* (a child). *Ki* is the sign of the plural, as *ki maw*, the stones. *Ki* in some few instances is used honorifically, as *ki Siem*, the king, *ki kthaw*, the father-in law.

Cases are eight in number, and are denoted by prefixes—the declension of the noun *lum* (hill) is given below by way of example:—

	Singular.	*Plural.*
Nominative	*u* lum	*ki* lum
Accusative	*ia* u lum	*ia* ki lum
Instrumental	*da* u lum	*da* ki lum

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

193

	Singular.	*Plural.*
Dative	*ia, ha,* or *sha* u lum	*ia ha* or *sha* ki lum
Ablative	*na* u lum	*na* ki lum
Genitive	*jong* u lum	*jong* ki lum
Locative	*ha* u lum	*ha* ki lum
Vocative	*ko* lum	*ko* phi ki lum

The sign of the genitive case *jong* is sometimes omitted for the sake of brevity, e.g., *u ksew nga* (my dog) for *u ksew jong nga.* The preposition *la* gives also the force of the possessive case, e.g., *la ka jong ka jong* (their own). There are some nouns which change their form, or rather are abbreviated, when used in the vocative case, e.g., *ko mei,* not *ko kmie,* = Oh! mother; *ko pa,* not *ko kpa* = Oh! father. These, however, are all of them nouns showing relationships.

Pronouns.—Personal pronouns are *nga* (I), *ngi* (we), *me* (thou, masculine), *pha* (thou, feminine), *u* (he, it), *ka* (she, it) *i* dimunitive form of *u* or *ka,* and *ki* (they).

The emphatic form of the personal pronoun is formed by prefixing *ma,* e.g., *manga, ma-u* after a verb, but not after a preposition, e.g., *dei ma-nga* = it is I. But *ai ia ma-nga* is an incorrect form.

The Reflexive Pronoun is formed by the word *lade* (self) being suffixed to the personal pronouns,—as *u leh sniu ia lade* = he does himself harm, or by the addition of the word *hi* (self) to the personal pronoun,—as *phi hi phi ong* (you yourself).

The Relative Pronoun is formed by the suffixes *ba, ei, no, ta,* added to any of the personal pronouns,—as *kaba, uba, kiba* (who, which) *kaei, uei, kiei* (who, what), *kano, uno, kino* (what, who), *kuta, uta, kita* [that, what].

The Demonstrative Pronoun is formed by the addition of the particles denoting the position of things with reference to the speaker, *e.g.,* (1) near = this, *ne* (*u-ne*) *kane, i-ne, ki-ne;* [2] in sight, but further off = that, *to* (*uto,* etc.); (3) further away, but still visible = that, *tai* [*u-tai,* etc.]; [4] out of sight, or only contemplated in the mind = that, *ta* [*u-ta* etc.]; [5] above = that, *eti* [*u-tei,* etc.]; [6] below = this, *thi* [*ka-thi,* etc].

The Interrogative Pronoun is the article followed by *no* or *ki* (e.g., *u-no, kano,* who), *u-ei ka-ei* (who, which).

Adjectives are formed by prefixing *ba* to the root, thus *bha* goodness; *ba-bha* good, *sniu* badness; *ba-sniu* bad. When *ba* is dropped, the word is no longer an adjective but a verb, and in some cases a noun, e.g., *uba khrau* [adj.] = big, great; *u khrau* = he becomes great. An adjective may be formed without any of the prefixes *ba, uba,* etc.,—e.g., *ka miau-tuh* = a thieving cat.

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

193 An adjective follows the noun it qualifies, and agrees with the noun it qualifies in gender and number.

Comparison.—The *Comparative* is formed by adding *kham* before an adjective, followed by *ban ia* [than], or simply *ia*; and the *superlative* by adding such adverbs of intensity, as *tam eh, eh than, tam, eh, shikaddei*, which are followed generally by *ia* or *ban ia*.

Numerals.—In Khasi the cardinal number always precedes the noun [e.g., *lai sin*, three times]. The following are the first ten numerals:—

1. Wei	6. Hinriu.
2. Ar.	7. Hinnieu.
3. Lai.	8. Phra.
4. Sau.	9. Khyndai.
5. San.	10. Shiphen.

The word *khad* is prefixed for forming the numerals from 11 to 19, e.g., *khad-wei, khad-ar*, eleven, twelve, etc.

Verbs.—The verbal root [which never varies] may be simple or compound. The compound roots are [1] *causals* formed by prefixing *pyn, pyl, kyn* to the simple root; *frequentatives* formed by prefixing *nang* [going on], *dang* still, *iai, ia* [continues to]; *inceptives* formed by prefixing *man*.

Reciprocals are formed by prefexing *ia*. There is only one form of conjugation for all verbs. Tense and mood are indicated by prefixes, number and person by the subject. When the subject is a noun, the pronoun is inserted before the verb. The following is the conjugation of the verb "to be" in the present, past, and future tenses:

Present.		Past.		Future.	
Singular.	Plural.	Singular.	Plural.	Singular.	Plural.
1	2	3	4	5	6
Nga long, I am.	*Ngi long*, we are.	*Nga la long*, I was.	*Ngi la long*, we were.	*Ngan long*, I shall be.	*Ngin long*, we shall be.
Me (mas.) or *pha* (fem.) *long*, thou art.	*Phi long*, ye are.	*Me* or *pha la long*, thou was.	*Phi la long*, ye were.	*Men* or *phan long*, thou shalt be.	*Phin long*, you shall be.
U (mas.) or *ka* (fem.) *long*, he or she is.	*Ki long*, they are.	*U* or *ka la long*, he or she was.	*Ki la long*, they were.	*U'n* or *ka'n long*, he or she will be.	*Kin long*, they will be.

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

193

The abo simple tenses are made definite or empathic by various means. *La*, sign of the past, when added to *lah*, sign of the potential has the sense of the pluperfect, e.g., *nga la lah long*, I had been. *Yn* abbreviated into *'n* emphasises the future, the particle *sa* also indicates the future, *da* is the usual sign of the subjunctive mood, *lada*, *la*, *lymda*, *tad ynda*, *ban da* are other signs of this mood. The sign of the infinitive is *ba'n*. The imperative is either (1) the simple root, or (2) the root compounded with some word such as *to*.

Participles.—The present participle is formed by prefixing *ba* to the root, e.g., *ba long*, being. The imperfect participle is formed by prefixing such words as *ba u*, *ka da*, *da kabá*, etc. The perfect participle is formed by putting such particles as *ba la*, *haba* ', *da kaba la* before the verb. Verbal nouns of agency are formed by efixing *nong* to the root, e.g., *u nong knia* (the sacrificer).

The *Passive Voice* is formed by using the verb impersonally and putting the subject into the Accusative case with *ia*.

Potentiality is indicated by the verb *lah*, necessity by the verb *dei*; *dang* and *da* show the indefinite present.

The negative is indicated by the particles *'ym* contracted into *'m shym* and *pat*. *Ym* is put before the verb,—e.g., ' *ym don briew* = there is no one; with a pronoun it is contracted, e.g., *u'm wan*, he does not come. It follows the sign of the future, e.g., *phi'n y'm wan*, you will not come. *Shym* and *pat* are negative particles, and with *negative verbs* in the past tense,—e.g., *u'm shym la wan*, he did not come.

The use of the word "jing."—One of the most striking features of the language is the use of the word *jing*, which is employed to create an abstract noun out of a verb: for instance, take the verb *bam*, to eat; if we prefix *jing* we have *jingbam* = food. *Bat* to hold, *jing-bat*, a handle. The use of the word *nong* has already been noticed under the heading "verbs." For example of another common prefix, it may again be mentioned here. Thus, *nong-ai-jingbam* means a table-servant, literally one who gives food. Again *nong-bat*, a holder, literally one who holds.

Syntax.—The order of words in the sentence is usually (1) subject, (2) verb, and (3) object, in fact, the same as in English, and in this respect it differs entirely from the order in the languages derived from Sansrit, and that of the languages of the Thibeto-Burman group as far as I have been able to ascertain. For instance, in the Kachari or Boro language the order in the sentence is (1) subject, (2) object, (3) verb. In Khasi when emphasis is needed, however, the object occasionally precedes the verb, e.g., *ia u soh u la die*, he has sold the fruit, literally the fruit he has sold. As stated before, adjectives follow the nouns they qualify, e.g., *u lum bajrong*, a high mountain, literally, the hill that is

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

193 high. Interrogative adverbs may either precede or follow the verb, e.g., *naei phi wan* or *phi wan naei*, where do you come from.[1]

121 18. *Conclusion.*—I have endeavoured to note down briefly above some of what seem to be the more prominent features of Khasi Ethnology, reserving a more detailed account of the Khasis for the monograph which is under preparation. In publishing this brief account, it is my hope that it may attract criticism by persons who are more familiar with the Khasis than myself, and it is my earnest desire that if experts who are acquainted with the Ethnology of the province of Burma and of that great country comprising the valleys of the Mekong and the Menam, find any points of resemblance between Khasi Ethnology and that of those regions, they will kindly bring these points to my notice, so that perhaps a clue may be found to the origin of the Khasis, which is at present so obscure.

[1] In the compilation of this brief notice of the Khasi language, I beg to
113 acknowledge my indebtedness to Dr. Grierson's Skeleton Khasi Grammar, the Revd. H. Robert's Khasi Grammar, and to Nissor Singh's "Hints on the Study of the Khasi language."—P. R. T. G.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

593 wedlock goes to the wife and becomes her property; but all other
428 property is inalienable, and reverts to his family, as also does his corpse after death.

771 'RELIGION.—The religion of the Khásiás is demon-worship, or a jumble of enchantments muttered by priests who are sorcerers. They invoke evil spirits as the deputies of God and the instruments
775 of His pleasure or displeasure. The Khásiás believe in metempsychosis, or the transmigration of souls. After death, human beings are transformed into monkeys, crabs, tortoises, frogs, etc. Though a future state is not denied, it is treated with absolute indifference, as beyond the sphere of responsibility; all rites, ceremonies, and observances bear reference to the welfare of mankind in this world. The spirits of their departed relatives and ancestors are invoked only in so far as they are considered to influence and have power
764 over the present life. The Khásiás burn their dead, and collect the ashes into urns, which are kept under a slab raised on four others enclosing a space. These monuments are of various kinds and sizes —one for individuals, another for a family, and another for a whole
614 clan. There is no caste system, but each clan is called after some object of nature, as the Oak clan, the Crab clan, etc., and these names entail certain restrictions beyond which intermarriage is
771 forbidden. The Khási religion may be briefly described as the practice of forms to cure diseases, and to avert misfortunes of all kinds, by means of ascertaining the name of the demon who is the author of the evil, and the kind of sacrifice necessary to appease it.

797 'CHRISTIANITY.—The Welsh Mission has been labouring amongst the Khásiás and Syntengs for thirty-two years. The Christians number about 1000 [according to the Census of 1872, the total number of native converts in the District is only 85]. There are four central stations—Cherrá, Shellá, Shillong, and Jowái —and twenty-three churches. Translations of the whole of the New Testament, and a portion of the Old, are now (1876) going to press, besides other religious books.

197 'LANGUAGE.—The definitions generally given of monosyllabic languages are far from adequate to enable us to assign to the
193 Khási tongue its position amongst the Indo-Chinese family of speech. Still, in the absence of a better terminology, it may be described as monosyllabic in the agglutinative stage. The monosyllabic element greatly predominates. By far the larger number of the compounds are mere agglutinations (in a modified

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

sense) or juxtapositions of roots which have not thereby suffered either obscuration or absorption—that is to say, they are all, with a few exceptions, reducible to their constituent root words, which are still "current coin," and retain their power as independent vocables. The cases in which obscuration and "fusion" of roots have taken place are confined to—(1) the noun prefix *jong*, expressing abstract ideas; (2) the verbal prefixes *byn*, *kyn*, *lyn*, *ryn*, *syn*, *tyn*, *pyn*, *byr*, *kyr*, *lyr*, *pyr*, *syr*, *tyr*, expressing causation, intensification, and contrariety. The language is found purest at Cherrá Púnjí. The Khásiás have no written character or literature of any kind of their own. Tradition says that *all* was lost while they were yet masters of the plains, whence they were driven by a general catastrophe or deluge to their present fastnesses in the hills. The following works on the language have been published: *Khási Grammar*, *Anglo-Khási Dictionary*, *Khási Primer* (Parts I. and II., with Vocabulary),—all issued by the Calcutta School-Book Society; *Khási English Dictionary* (in preparation), and an *Anglo-Khási First Book*.

'CUSTOMS REGARDING INHERITANCE.—A Khásiá, whether married or single, if he makes his mother's house his home, is said to be earning for his *kur*, *i.e.* for his mother, or his brothers and sisters, or his mother's relatives. On his death his property goes to his mother, if living; if not, to the grandmother; if she is not living, then to his sisters; should his sisters also be dead, to his sisters' children. Should the deceased have left no sisters, the property goes to the brothers; should he have no brothers or should they be dead, the property descends to his aunts, or to their children if the aunts are not living; should the aunts have left no children, the property descends to the grandmother's or great-grandmother's sisters or children. The property of a female on her death goes to her mother, if the deceased have no children; or if the mother of the deceased is not living, the property goes to the brothers and sisters; if the sisters are dead, then their children become the heirs. If there are no such children, the property devolves as in the case of males. When a man is not living in his mother's house, but in that of his wife, he earns for his wife and children. On his death his property descends to his wife, with the exception of the ornaments and clothing worn by him during his lifetime, which go to the brothers and sisters or other relatives of the deceased. Should the deceased have been a widower, the property goes to his children, and in their absence

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

III. Explanations

1. General

124 128 601 Most of my informants were illiterate. The spelling of the terms was checked and corrected by my English-speaking and writing Khasi- and Pnár- friends, mentioned in para one, to whom thanks are being here once more expressed. All responsibility for spelling mistakes, however, which may have slipped into this list has of course to be borne by me.

Blanks (—) or question marks (?) in one of the columns do not necessarily mean that there is no word used, by the respective group, for the particular term. They more often indicate that my informants did not use, or know, the particular term, or that I failed to enquire about it in a [114] manner sufficiently clear to my informants. This is particularly true of general terms, partly or fully corresponding to English general terms, such as parents or grand-parents, or the terms No. 9/*a* and *b*, 13, 15/*a*, 19-21, and 26, which were partly explained to me, by Khasi friends in Shillong, where I stayed some time after completion of field-work during the rainy season. Hence I could no more return for verification to the little accessible Wár-villages in the steep southern slopes. Although I am planning to utilise a future opportunity for such checking up, I am yet publishing the present results in the hope that they may thus become accessible to field-workers among other S. E.-Asiatic, and especially Austro-Asiatic speaking peoples.

193 601 128 All terms which are equal for both sexes (cf. Nos. 10, 11, 18, 19, etc.) are used with *ka* and *u* respectively. These sexdetermining preposed articles, as also the honorific *i* are specially mentioned in the list, only if this is essential for the understanding of the respective terms as in Nos. 3-5, 7, 8, or 10.

2. Special

601 Term No. 1 — to give birth or beget (*kha*) signifies also relatives on the paternal side as in *para kha* (paternal cousins No. 9/*c*), in contradistinction to *para kur*, 9/*b*, (lit.: cousins of the clan), i. e. maternal cousins, since the clan is a matrilineal unit. This usage of the word *kha* appears also [842] significantly in the terms 15/*a*, 17, 18/*b*, 20, 22, 32 and, as an integral part of the Khasi kinship terminology, renders it highly improbable that the Khasi matrilineal system could lave originated in ignorance of the biological function of the father. It is a significant feature in the matrilineal social system.

The terms 3 to 3/*b* refer to unmarried but biologically marriageable youths. [881] It will be noted that there are (and were in 1914) no indications of puberty-[584] rites for either girls or boys. There is also no child-marriage among Khasi. The use of special terms for mature, unmarried youths is therefore significant.

Term 6 — *i* as honorific article, is at the same time indicative of [428] diminution [23], which is remarkable for two reasons: (firstly) the diminution is used for the oldest and most respected family members, like the diminution

[23] NISSOR SINGH (1906), p. 83.

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

of father in Russian (for the *tzar*, etc.), (secondly) the youngest, not the oldest, daughter performs the family rites and inherits the family-property [26]. Even in cases when there is no woman to inherit, the youngest, not the oldest son inherits [27]. Among the conservatively matrilineal Pnár (Jaintia) this term of diminution *i*, however, carries at times a somewhat contemptuous meaning, though the minorate is strongly in force also among them. The ambivalent position of this honorific term of diminution is thus significant (comp. term 9/*e* among Pnár and infra.) 601 [428] [196]

Term 7 — mother: (*i mei*) — The prefix *i* used among Khasi and Wár Khasi signifies particular reverence (supra: term 6). The classificatory character of the term has been discussed by CHATTOPADHYAY [28]. [193]

Term 9/*f* — *hep* for all younger siblings, cousins and even other young folk does not indicate the consideration which the terms 9/*d* — *hong* for older sisters and female cousins, or 9/*e* — *bah* for their male equivalents indicate. The term *san* (9/*e* among Pnár) stands here, as generally, for elder and implies a honorific meaning (comp. term 6 supra and term 13/*a* infra).

Terms 10/*a* and *b* show that husband and wife address each other by equal terms and do in no way indicate anything like an inferior position of either wives or husbands of which I did also not find any indications otherwise. It may here be mentioned that property rights even in newly established estates, vest in women and are inherited by women, — not generally men. 601 562

Term 11*d* — *ka khun khaddnh* — the youngest daughter whose important position in Khasi religious ritual, social organization and inheritance law has already been referred to sub term 6 and described in detail elsewhere [29]. The affectionate character of this term finds vivid expression in the abbreviation *ka duh*, which I heard from sisters and the father of a youngest daughter. 601 [593]

Term 13/*a* — *mei san* (mother's older sister). The word *san* (older) here has a definitely honorific character, although the *mei khynnah* — the mother's younger sister (term 13/*b*) may be the heir of Ego's ancestral property. This constellation corresponds to the peculiar significance of terms 6, 9/*d* and especially 11/*d* (supra).

Terms 13, 14, 15/*a*, 18, 18/*a*, 18/*b*, and the terms for cousins 19, 20, 21/*a*, 21/*b*, 22 show, like term 7 — mother (supra), classificatory character. The restriction on cross-cousin marriage is of different nature, according as to whether they belong to different households, or not, as has been discussed by CHATTOPADHYAY [30]. [582]

Term 16/*a* — *ñia* (mother's brother's wife) is basically the same as term 15 — *ñia kha* (father's sister) [31] though the latter is qualified by the additional term *kha*: (begetting, birth) which signifies paternal relationship (see: term No. 1).

193
192

VERBS.

byngem-byrsit	to threaten.
shepting-shepsnij	to be afraid.
ithtuh-ithtiw	to be familiar.
kyrpad-kyrpen	to beg.
ia him-ia lang	to assemble.

ADJECTIVES.

ba-niw-bannuh	bad.
bamat-bating	active.
dunbor-dunwor	powerful.
don burom-don [illegible]	noble.
bakhraw-latri	pertaining to a noble family.
bahah-bauk	poor, needy.
bahah-bauk	righteous.
bariwbha-riwmiat	wealthy.

ADVERBS.

[illegible]	[illegible]
hain-hain	brilliantly (red).
prum-prum, prum-prum	prominently.
rynulaw-rynulain	shrinkingly.
nior-nior, nior-nior	shakily.
ior-ior, ior-ior	weakly.
parum-parah	many.
sip-sip, sap-sap	having no taste.

The Mikirs appear to have borrowed a small portion of their vocabulary from the Khasis. The following are quoted as examples of possible common roots:—

	Mikir.	Khasi.
belly	*pik*	*kpuk.*
strike (v.)	*chik*	*shuk.*
father	*pa*	*kpa.*
come (v.)	*ring*	*ring.*
raw beer	*kar*	*kiar.*
maternal uncle	*ni-lar*	*lai.*

197 The Lyngam dialect differs so much from the standard Khasi that some remarks regarding the former will not be out of place. Dr. Grierson, on pages 17 to 19 of his Volume II. of the "Linguistic Survey of India," has indicated some of these differences, which may be recapitulated here as follows. Some of the commonest verbs vary considerably from those used in the standard dialect. There are also many minor differences of
197 pronunciation. A man is a *kwa*, not a *kwiaw*, a son is a *u khon*,
193 not a *khun*. Standard *ng* is often represented by *nj*. Thus
197 *dinj* for *ding*, fire. A final *k* often appears as *h*, and an initial *k* as *p*. Thus, *kurah* (Standard), all, becomes in Lyngam *pruh*.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Standard *ei* becomes *aw*. Thus *wei*=*waw*, one; *dei*=*daw*, be necessary. The articles are frequently omitted. The pronoun *u* is used for the plural as well as the singular, instead of the Standard plural *hi*. The diminutive *i* is used with inanimate nouns. This is also sometimes the case in the Standard form. 197 193 194

Nouns.—The prefix of the Accusative-dative is *se* or *sa*, often contracted to *s'* instead of *ia* (Standard). The prefix of the Dative is *hanam*, *hnam*, or *tnam*. The Standard Dative-locative prefix *ha* is also used, and may be spelt *he* or *hy*. *Ta* or *te* are also found. For the genitive, besides the Standard *jong*, are found *ba*, *am-ba*, *am*, and *am-nam*. *Am-nam* and *am* also mean "from." 193

The plural sometimes takes the suffix *met*.

Adjectives.—The usual word for male is *korang*, and for "female" *konthaw*, in place of the Standard *shyarang* and *kynthei* respectively. The following are examples of comparisons:—*Re-myrriang*, good; *Mai-myrriang*, better; *U re-myrriang*, best. The Standard *tam* is also used for the superlative.

Pronouns.—The Personal Pronouns are:—

	Singular	Plural
1st Person,	*se*	*biaw*, *iaw*.
2nd Person,	*mi*, *mei*	*phiaw*.
3rd Person,	*u*, *ju*, *u-ju*	*kiw*.

The Nominative of the pronoun of the second person singular is given once as *ba-mi*, and once as *ma-mi*. The *ma* or *ba* is the Standard emphatic prefix *mo*.

Demonstrative Pronouns appear to be *be*, *tei* that, and *uni*, or *nih*, this. *Be* is used as a definite article in the phrase *be jowmai*, the earthquake.

The Relative Pronoun is *u-lah*, who.

Interrogative Pronouns are *set*, *u-iet*, who? and *met*, what?

Verbs.—The pronoun which is the subject of a verb may either precede or follow it. Thus *se rip*, I strike; *rip biaw*, we strike. The words meaning to be are *re*, *im*, and *meit* in addition to the Standard *long*. Like the Standard *don*, *im*, corresponding to Synteng *em*, also means to have. As in the

773 Several Khasis claim that the devil pre-
782 scribed to their ancestors the method of sacrificing. On the other hand others maintain that in times past a man of rare size and strength came to their country. This man accomplished wonderful things, and commanded their ancestors to sacrifice and at the same time prescribed for them the method of sacrificing. Today the place
[163] of his former dwelling on a mountain near Shillong is still pointed out. Since something divine was suspected in that man, he was called u 'lei shillong (the god Shillong).

776 The Khasi believe in a highest being, whom they call u blei nongthaw (1) (the creator god).

•[194] 1. Pronounciation of Khasi (method of writing): ei is pronounced as two syllables, e - i, w is pronounced like u, aw is therefore like a - u, sh is pronounced like sch = phonetic ʃ.

Just as the ideas about this person are very hazy, so are the concepts of eternity and the soul.

775 The Khasi are not in agreement among themselves about the conception of what happens to the soul after death. Several say that after death the soul goes up in the air and becomes air and therefore exists no longer. But most of them believe that the soul exists after death and can be happy or unhappy. But this does not depend on personal guilt or sin but only on the conscientious completion of the burial ceremonies.

[631] The country in which the Khasi live is
776 divided into several districts, which were formerly ruled by several kings before the English came. [408] According to the Khasi each district

I: Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

indeed, belong to the untranslatables of the language. We are never in want of a specific term to express the appropriate degree of any quality." To learn how to use the right adverb at the right time is one of the niceties of the language. There is a peculiarity about some of the adverbs of place which should be mentioned: e.g. *Hengto*, there (within sight); *hengne*, here; *hengto*, there (out of sight); *hengtei*, there (at some distance); *hengtei*, there (upwards); *hengthi*, there (downwards); also the interrogative adverbs *hengno*, *nengno*, whence, contain the inherent root *ngo*, and it seems possible that this *ngo* is the first personal pronoun I. If this is so, *hengto* would mean literally "to me there," *hengthi* "to me down there," and similarly *nengno*, *nengno* would mean "from where to me there" and "from there to me here." 193

Adverbs generally follow the words they modify, as *u'n leit nyuiw-ba* will go now, but there are exceptions to the above rule, such as interrogative adverbs. The following come before those they modify: *long ska*, *la dang* (as soon as, when); *khem*, *ehait* (used to, ever); *pat ne pat* (yet); and *ahym* (not); but *ahah* (more) goes last. Adverbs of past time are formed by prefixing *ngo*, e.g. *ngnikyoo*, a short time ago. Adverbs of future time are formed by prefixing *la*. The particles *man*, *man la*, and *lada* denote repetition.

The Khasis are exceedingly fond of using double words* which add much to the finish and polish of a sentence. Old people especially have a predilection this way. It is one of the great difficulties of the language to learn how to use such double words correctly. The following are some examples:— [195] 193 194

Nouns.

bajem ka sap	cloth.
ka kot ka ala	paper.
ka lyoti ka synghing	road.
ka ting ka ara	house.
o lalu, o phalu	lake.
o tymen o ram	elder.
ka sih, ka wah	arms (lit.; shield and sword).
o lashu ka ma	a well to do person.
ka synh ka phew	wealth.
o bha o ema	a relation on the father's side.

Verbs.

pynneh pynmin	to comfort.
ka shah ka dat	to scoffs.

* Khasi love lyrics.

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

of father in Russian (for the *tzar*, etc.), (secondly) the youngest, not the oldest, daughter performs the family rites and inherits the family-property [34]. Even in cases when there is no woman to inherit, the youngest, not the oldest son inherits [35]. Among the conservatively matrilineal Pnár (Jaintia) this term of diminution *i*, however, carries at times a somewhat contemptuous meaning, though the minorate is strongly in force also among them. The ambivalent position of this honorific term of diminution is thus significant (comp. term 9/*a* among Pnár and infra.) 601 [428] [196]

Term 7 — mother: (*i mai*) — The prefix *i* used among Khasi and Wár Khasi signifies particular reverence (supra: term 6). The classificatory character of the term has been discussed by CHATTOPADHYAY [36]. [193]

Term 9/*f* — *hep* for all younger siblings, cousins and even other young folk does not indicate the consideration which the terms 9/*d* — *hong* for older sisters and female cousins, or 9/*e* — *hah* for their male equivalents indicate. The term *saw* (9/*e* among Pnár) stands here, as generally, for elder and implies a honorific meaning (comp. term 6 supra and term 13/*a* infra).

Terms 10/*a* and *b* show that husband and wife address each other by equal terms and do in no way indicate anything like an inferior position of either wives or husbands of which I did also not find any indications otherwise. It may here be mentioned that property rights even in newly established estates, vest in women and are inherited by women, — not generally men. 601 562

Term 11/*d* — *ka khon khaddah* — the youngest daughter whose important position in Khasi religious ritual, social organization and inheritance law has already been referred to sub term 6 and described in detail elsewhere [37]. The affectionate character of this term finds vivid expression in the abbreviation *ka dah*, which I heard from sisters and the father of a youngest daughter. 601 [393]

Term 13/*a* — *mei saw* (mother's older sister). The word *saw* (older) here has a definitely honorific character, although the *mei khynnah* — the mother's younger sister (term 13/*b*) may be the heir of Ego's ancestral property. This constellation corresponds to the peculiar significance of terms 6, 9/*d* and especially 11/*d* (supra).

Terms 13, 14, 15/*a*, 18, 18/*a*, 18/*b*, and the terms for cousins 19, 20, 21/*a*, 21/*b*, 22 show, like term 7 — mother (supra), classificatory character. The restriction on cross-cousin marriage is of different nature, according as to whether they belong to different households, or not, as has been discussed by CHATTOPADHYAY [38]. [582]

Term 16/*a* — *kia* (mother's brother's wife) is basically the same as term 15 — *kia kiai* (father's sister) [39] though the latter is qualified by the additional term *khe*: (begetting, birth) which signifies paternal relationship (see: term No. 1).

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

114 China thus constituted, to which the Khasis belong, was
144 in some way connected with the large linguistic family in the Indian-Peninsula once called Kolarian, but now more generally known as *Mundā*, who inhabit the hilly region of Chutia Nagpur and parts of the Satpura range in the Central Provinces. Of these tribes the principal are the Santhāls, the Mundās, and the Korkus. In physical characters they differ greatly from the Indo-Chinese Khasis, but the points of resemblance in their languages and in some of their institutions cannot be denied; and the exact nature of the relation between them is as yet one of the unsolved problems of ethnology.

114 The work of Logan was carried further by Prof.
197 Ernst Kuhn, of Munich, who in 1883 and 1889 published important contributions to our knowledge of the languages and peoples of Further India. More recently our acquaintance with the phonology of Khasi and its relatives has been still further advanced by the labours of Pater W. Schmidt, of Vienna, whose latest work, *Die Mon-Khmer Völker, ein Bindeglied zwischen Völkern Zentralasiens und Austronesiens* (Braunschweig, 1906), has established the relationship of Khasi not only to the Mōn-Khmēr languages, but also to Nicobarese and several dialects spoken by wild tribes in the Malay Peninsula.

There still remains much to be done before the speech of the Khasi nation can be considered to have been thoroughly investigated. In the *Linguistic Survey* four dialects are dealt with, the standard literary form, founded on the language of Cherrapunji, the *Pnār* or *Syuteng*, of Jowai, the *War*, spoken in the valleys on the southern face of the hills, and the *Lyngngām*, spoken in the tract adjacent to the Garos on the west. Major Gurdon (p. 203) mentions a fifth, that of Jirang

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

or Mynnār, spoken in the extreme north, and there may be others. A great desideratum for linguistic purposes is a more adequate method of recording sounds, and especially differences of tone, than that adopted for the standard speech, which though sufficient for practical purposes, does not accurately represent either the quantity or the quality of the vowels, and leaves something to be desired as regards the consonants (especially those only faintly sounded or suppressed). These things, no doubt, will come in time. The immense advance which has been made in education by the Khasis during the last half-century has enabled some among them to appreciate the interesting field for exploration and study which their own country and people afford; and there is reason to hope that with European guidance the work of record will progress by the agency of indigenous students.

It remains to summarize briefly the principal distinctive features of this vigorous and sturdy race, who have preserved their independence and their ancestral institutions through many centuries in the face of the attractions offered by the alien forms of culture around them.

In the first place, their social organization presents one of the most perfect examples still surviving of matriarchal institutions, carried out with a logic and thoroughness which, to those accustomed to regard the status and authority of the father as the foundation of society, are exceedingly remarkable. Not only is the mother the head and source, and only bond of union, of the family: in the most primitive part of the hills, the Synteng country, she is the only owner of real property, and through her alone is inheritance transmitted. The father has no kinship with his children, who belong to their mother's clan; what he earns goes

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

144 regards social customs, with the Khasis; but it will be noticed
211 in the chapter dealing with memorial stones that some of the
171 Naga tribes are in the habit of erecting monoliths somewhat similar in character to those of the Khasis, and that the Mikirs (who wear the Khasi sleeveless coat), erect memorial stones exactly similar to those of the Khasis. The evidence seems to suggest a theory that the Mon-Anam race, including of course the Khasis, occupied at one time a much larger area in the mountainous country to the south of the Brahmaputra in Assam than it does at present. Further references will be found to this
144 point in the section dealing with memorial stones. The fact
171 that the Ho-Mundas of Chota Nagpur also erect memorial stones and that they possess death customs very similar to those of the Khasis, has also been noticed in the same chapter. We have, therefore, the following points of similarity as regards customs between the Khasis on the one hand, certain Eastern Naga tribes, the Mikirs, and the ancient inhabitants of the Malay Peninsula on the other :—

(a) Peculiarly shaped hoe, i.e. the hoe with far projecting shoulders	1. Khasis. 2. Certain Eastern Naga tribes. 3. The ancient inhabitants of the Malay Peninsula. 4. The ancient inhabitants of Chota Nagpur (the Ho-Mundas ?).
(b) Sleeveless coat	1. Khasis. 2. Mikirs. 3. Certain Eastern Naga tribes.
(c) Memorial stones	1. Khasis. 2. Mikirs. 3. Certain Eastern Naga tribes. 4. Ho-Mundas of Chota Nagpur.

• 197 I wish to draw no definite conclusions from the above facts,
144 but they are certainly worth considering with reference to Logan's theory as stated by Peal: the theory being based on Logan's philological inquiries. Thanks to the labours of Grierson, Logan, and Kuhn in the linguistic field, we know that the languages of the Mon-Khmêr group in Burma and the Malay Peninsula are intimately connected with Khasi. I say, intimately, advisedly, for not only are roots of words seen to be similar, but the order of the words in the sentence is found to be the same, indicating that both these people think in the same order when wishing to express themselves by speech.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

SECTION III.

LAWS AND CUSTOMS.

TRIBAL ORGANIZATION.

101 [197] THE inhabitants of the Khasi and Jaintia Hills may be said to be divided into the following sections:—Khasi, Synteng or Pnar, Wár, Bhoi, and Lynngam. These divisions represent collections of people inhabiting several tracts of country and speaking dialects which, although often deriving their origin from the Khasi roots, are frequently so dissimilar to the standard language as to be almost unrecognizable. The above sections may be sub-divided as follows:—The Khasis into the inhabitants of the central high plateau, Cherra and Nongstoin, Mahafam, Mario, Nongkhlaw, and the neighbouring Siemships. The Syntengs or Pnars may be divided as follows:—Into Syntengs proper, Nongtungs, and Kharwangs; the Wárs into Wár proper, and Wár Pnar; the Bhois into Jinthongs, Mynris, Ryngkhongs, and the Khasi-Bhois, i.e. Khasis who inhabit the low country to the north of the district, which is called generally the "Bhoi." The Lynngams are a separate division. They must not be confused with the Dkos or Hanas who are Garos. It must, however, be remembered that the Jinthong, Mynri, and Ryngkhong Sub-divisions of the Bhoi division are not Khasi, but Mikir, i.e. they belong to the Bodo or Bara group. The Lynngams are half Khasis and half Garos, and the Dkos or Hanas are Garos who observe the Khasi custom of erecting memorial stones. The above tribes and sub-tribes are not strictly endogamous, nor are they strictly exogamous, but they are more endogamous than exogamous; for instance, Syntengs more often marry Syntengs than Khasis, and *vice versâ*, and it would be usually considered derogatory for a

101 582 614

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

764 a similar custom prevalent amongst the Khyrwangs. The Nongtungs, in the Jaintia Hills, keep dead bodies sometimes as long as a month, until the *phur* or ceremonial dance has been [1335] performed. Hence they are called *Nong-tung*, or "stinkers." Amongst the Lyngams the dead body is kept for sometimes three or four months, or up to the time when a bull can be procured for a feast to the villagers. This feast is an essential, [1231] and, cattle being scarce in the Lyngam country, there is often great delay in disposing of the body. Lyngam villages at such a time are best avoided. The Lyngams of Nongsohbar bury the unburnt bones of the deceased within the village, and in front of the house occupied by the deceased when alive, the bones being placed in a hole in the ground, over which is laid a stone, a bamboo mat being nailed over the stone. A bamboo fence three or four feet high is erected round the grave. Other Lyngams bury the uncalcined bones and ashes in a gourd in the jungle near the burning-place. On their way home, the members of the clan of the deceased who have come from other villages to witness the funeral obsequies, put up a stone on the path in honour of the deceased, a turban being tied round the top of the stone. The Garos or Dkos, who live at the foot of [1211] the hills on the Kamrup border, and are called by the Assamese *Hana* (spear-men), erect memorial stones in honour of the deceased, the lower jaw-bones of sacrificial animals and other articles being hung on the stones. The stones are also swathed in cloths, and turbans are tied round the tops. The death customs of the Lyngams, and, indeed, other customs also, are partly Khasi and partly Garo, it being difficult to say that the [1197] Lyngams are more Khasi than Garo, or more Garo than Khasi in this respect; their language, however, has been found by Dr. Grierson to be a corruption of Khasi. In Nongstoin, Mawlih, and Mariaw villages, the inhabitants of which profess to be Khasis, the bones and ashes of the deceased are not collected and placed in repositories, as at Cherrapunji. At Mariaw and Nongstoin a large wooden coffin is used, painted white, with ornamentations on the outside, and standing on four legs. 764 This coffin is not burnt on the funeral pyre. In the 643 family of the chiefs of Cherra, the body of a deceased Sien is 766 subjected to the following process:—It is wrapped in a cloth

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

806
443

Khasi Hills.	Jaintia Hills.
1. Lynkah (Barpani or Khawang)	Kyllao. (Suhtnga).
2. Nongkrem	Pynsing.
3. Um-long (Maolong the hat at Laban)	Maolong. (Nartiang).
4. Ranghep (Jeu-bah at Cherra) (Mawtawar in Mylliem) (Unsaw in Nongkhlaw)	Maosiang. (Jowai).
5. Shillong (Laitlyngkot)	Maoshai. (Shangpung).
6. Pomtih or Pomtiah (Mawkhar, small market)	Pynkat. (Mynso).
7. Umnih	Thym-blein.
8. Yeo-duh (Mawkhar, large market)	Ka-hat. (Jaintiapur).

In the Wár country, markets are usually held every fourth day, e.g. at Nongjri, Mawbang, Tyllap, and Shella. At Theria the market is held every Friday, and at Hat-majai, or Bholagunj, every Tuesday.

THE LYNNGAMS.

101 Although mention has been made incidentally in various
131 parts of this monograph of Lynngam customs, it has been thought necessary to give the Lynngams a separate chapter, as these people differ so very greatly from the Khasis in their manner of life, and in their customs. *Lynngam* is the Khasi name; the Garo name for the Lynngams is *Megam*. There
[341] are several *Megam* villages in the north-eastern corner of the Garo Hills district, and there is regular communication kept up between these villages and the Lynngam inhabitants of the Khasi Hills district. The Lynngams must not be confused with the *Hání* or *Námdaniya* Garos who inhabit the low hills to the north of the Khasi Hills district, and are called by the
101 Khasis *Dko*. All Lynngams claim to be Khasis, they dislike
197 being called Garos; but although it is true they speak what may be called a dialect of Khasi, and observe some of the Khasi customs, the Lynngams are more Garo than Khasi. Before
101 proceeding further, it should be stated that the Assamese of Boko call the Lynngams *Núniyá* Garos, all hill people being Garos to the Assamese of that region, without distinction

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

SECTION VII.

LANGUAGE.

197 BEFORE commencing to describe the more salient features of the Khasi language, its grammar, and syntax, it seems to be of importance to show how intimately connected Khasi is with some of the languages of Further India. In the middle of the last century Logan pointed out affinity between Khasi and these languages, but it has been left to Professor Kuhn to prove this connection to demonstration. The examples of comparative vocabularies which follow are taken from Kuhn's "*Beiträge zur Sprachenkunde Hinterindiens*," Sir George Scott's "Upper Burma Gazetteer," and Sir George Campbell's lists. It will be seen from the collections of words that follow how Khasi possesses many words in common with Mon or Talaing, Khmêr, Suk, Stieng, Bahnar, Annam, Khamen-Boram, Xong, Samre, Khmu, Lemet, Palaung, and Wa. There is some correspondence, although perhaps to a lesser degree, between Khasi and the Ho-Munda languages and those of Malacca and the Nancowry language of the Nicobar Islands.

192 197 Let us now examine the table of numerals. The Khasi word for 1 is *wei*, but in the Amwi dialect of Khasi it is *mi*. In Khmu the word is *mui*, also in Suk; in Mon *mwoi* and in Xong *mui*. The word for 2 is identical in Khasi and Lemet, viz. *ar*. The word for 3, viz. *lai*, is identical in Khasi and Wa; also compare Lemet *lohe*. Khasi *saw* and Lakadong *thaw* for 4 are, however, deviating forms. In the case of 5, if we cut out the prefix *m* in the Mon word *m'sun*, we have fairly close agreement with the Khasi *sun*. In the numeral 6, if we cut out the prefix *hiu* of the Khasi (*hiu*)*riw*, and the initial *t* of Mon and Suk *t'rou*, *trou*, we have close agreement. In the Khasi words for 7 and 8 the syllable *hin* is but a prefix. This is also probably the case in the Khasi word (*khyn*)*dai* for 9, and the *shi* in the Khasi word *shiphew*, 10, merely means one.

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

It will be seen that there is considerable similarity in the numerals of the different languages up to six, the correspondence being most strongly marked in the numerals 1, 2, 5, and 6. If we remember that primitive people seldom can count higher than the number of digits of one hand, the dissimilarity in the numerals, as the end of the decade is approached, is probably explained. As the different people speaking these languages gradually advanced in civilization they learned to count further; but by this time they had become in some cases like those of the Khasis, the Palaungs, and Mons, widely separated from one another. As they advanced in civilization, and found the necessity of an improved notation, they manufactured numerals which differed from one another, although they retained the first few numerals they had made use of in their days of savagery. Let us now study some extracts from Kuhn's interesting comparative vocabulary.* We find many instances of agreement. I give some examples:—

Heaven.—Palaung, *pleng*; Khmêr, *plieng* (rain); Xong, *pleng*; Khasi, *bueng*. Mynnar (Jirang) *phaslieng* seems to be very near Khmêr *phlieng*, and Palaung, and Xong *pleng*.

Day (Sun).—Khmêr, *thngay*; Mon, *tngei*; Annam, *ngay*; Lemet, *ngay pri*; Palaung, *sengei*; Khasi, *sngi*; Lakadong, *sngei*; Kol, *singi*.

Year.—Mon, *snâm*; Annam, *nam*; Stieng, *so'nam*; Bahnar, *sanam*; Khasi, *snem*.

Lightning.—Mon, *l'li*; Khasi, *leilik*.

Stone, Rock.—Mon, *tmâ*, *k'mew*; Stieng, *to'mâu*; Bahn, *tmo*, *temo*; Khmêr, *thma*; Xong, *tmo*; Palaung, *maw*; Ba, *maou*; Khasi, *mew*; Wa, *kei-mo*, *kei-mau*. Also compare Mynnar (Jirang) *smaw*.

Water.—Palaung, *ea*; Khasi, *um*; Lakadong, *ea*; Anwi, *ea*; Mynnar (Jirang), *dm*; Rumai, *um*. Probably the Stieng *um*, to bathe, can be connected with the Khasi word for water.

Sea, pond, or tank.—Khmêr, *ping*; Khasi, *pung*.

Rice.—Mon, *sru*, paddy, seems to be in connection with Khmêr, *srur* (spoken *sruu* or *srou*).* Xong *rako* is in Palaung *rakao*, *sakao*, or *takao*. These words remind us of the Khasi

* Kuhn's "Beiträge zur Sprachenkunde Hinterindiens."

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

197
192

khaw, which seems to be borrowed from the Shan *khaw* (*khao khan*).

Dog.—The common word for this animal will be found to be nearly the same in sound in many of these languages, e.g. Suk, *cho*; Stieng, *sow*; Bahnar, *ko*, *cho*; Annam, *cho*; Xong, *tcho*; Mi, *khwa*; Lemet, *so*; Palaung, *tsao*, *kaso*; Khasi, *kaw*. The Mon *khloie* is the same as the Khasi *kaw*, if l is changed into s. The Lakadong and Synteng dialects of Khasi have *kaw*, and Mynnar (Jirang) *kaw*.

Rat, mouse.—Mon, *krai*, *gui*; Stieng, *ko'uei*; Bahnar, *kuo*; Khasi, *khwai*.

Swine.—Bahnar *ninny* is evidently Khasi '*ning*, the abbreviated form of *ninong*.

Tiger.—Mon, *kla*; Stieng, *kleh*; Bahnar, *kla*; Khmér, *khlâ*; and Khasi, *khlâ* are evidently the same. With this compare the Kol *kula*, *kulâ*, *khlâ*.

Bird.—Sam, *kiem*; Mon, *g'eem*, *ka-teim*; Hiri, *chiem*; Stieng, *chum*; Bahnar, Annam, *chim*; Xong, *chiem*; Palaung and Wa, *keim*, and Khasi *sim* are clearly the same. Also compare Mynnar (Jirang), *keem* which is very near to Mon, *g'eem*.

Ear.—Hiri, *kut*, *gur*; Suk, *gur*; Bahnar, *ir*; Stieng, *ûr*; Khmu, *gre*; Lemet, *er*; Palaung, *ker*, and Khasi, *eier*, abbreviated into '*ier*, are probably the same.

Fish.—The word *ka ar* *kha* runs through the following languages:—Mon, Stieng, Bahnar, Annam, Khmu, Lemet, Palaung, Wa: and if we cut off the first syllable of the Khasi word for fish, *dokkha*, we find '*kha*, which is the same word as in the languages above mentioned, with an aspirate added. The Khasi *doh* merely means flesh, and the word *dokkha* is very frequently abbreviated, cf. '*kha ooi*, '*kha iong*.

Crab.—Mon, *kâ'kiau*; Khmér, *kdau*; Khasi, *khau*. If we add the gender sign to the Khasi word, it becomes *ka khau*, and we have exact correspondence.

Woman.—Mon, *kwa* or *kwa*. Is this the same as the Khasi (*ka*) *kwai*?

Child.—Sam, *kdo*; Suk, *kou*; Mon, *kou*; Hiri, *kuou*; Annam, *kon*; Khmér, *kou*; Khasi, *khun*. Compare Nancowry, *kon*.

Eye.—The word *mât*, *mat*, *mit*, runs through several of these languages, e.g. Mon, *mat*; Hiri, *mat*; Stieng, *mat*; Bahnar,

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

mat; Annam, *mat*; Khasi, *khmáit* (dialectic *mát*). In Nancowry compare *almat*, eye, and *almat*, eyebrow, and (*e*) *mat* (*hen*) *mat* (*drwy*), *mat*, of the Nicobar dialects, also Semang *mat*, *mat*, *mad*. Kuhn remarks that the word *mat* is common for "*sight*," and "*eye*" all over the Malay Archipelago. It should be remarked that in the Amwi and Lakadong dialects of Khasi the word is *mát*. 196 197

Nose.—If we cut off the aspirate *kh* from the Khasi *khmat*, which thus becomes *mat*, we find some correspondence between Mon, *mah* (*mu*); Stieng (*bro*), *mih*; Bahnar, *mah*. Here also compare Ho *mue*, *mute*; Mundari, *mue*; Uraon, *muy*. In the Amwi and Lakadong dialects of Khasi the word is *mur-long*.

Hand.—Xong, *ti*; Mon, *tei*; Annam, *tay*, Khmer, *te* (from *ang te*, finger); Palaung, *tee*, *tei*, and Khasi, *khti* (with prefix *k*) closely correspond. The forms *te* and *tei* of Amwi, and Lakadong, respectively, still more closely correspond with the Mon-Khmer languages than with Khasi. Here compare Nancowry *tei* and *ti*, or *ti* of the Kol languages.

Blood.—Palaung *koom*, and Wa *nam* closely correspond with Khasi *ooim*; here compare Khmér *jhám*.

Horn.—Mon, *grung*, the horn of an animal, may be compared with the Khasi *rung*.

Far.—Distant. Bahnar, *kengei*; Annam, *xaei*; Khmér, *chhngay*; Lemet, *mpay*; Sue *chepei* may be compared with the Khasi *jing-ngei*. Amwi *chnjingei* seems to be a closer form to the above than Khasi *jing-ngei*. But compare Mynnar (Jirang), *chengi*, which is clearly very close to Sue *chepei*, and Khmer *chhngay*.

To weep, to cry.—Mon, *gém*; Khmer, *gem*; Khmu Lemet and Palaung, *gem*, are clearly the same as Khasi *ém*, with which also may be compared Ho *gém*.

It is interesting to note that the Amwi and Lakadong dialects of Khasi, which are spoken by the people who dwell on the southern slopes of the Jaintia Hills, seem more closely to correspond with the Mon-Khmer forms than even with Khasi. The Mynnar or Jirang dialect of Khasi, spoken on the extreme north of the hills, also appears to possess some words which are very similar indeed to some of the Mon-Khmér forms given by 197

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

197 Professor Kuhn. Unfortunately, I had time to collect but a few words of this interesting dialect, as I arrived in the portion of the country inhabited by these people only a short time before submitting this monograph to Government. The Mynnar dialect appears to be akin to the Synteng, Lakadong, and Amwi forms of speech. The Mynnars observe also the Synteng ceremony of "*Beh-ding-khlam*," or driving away the demon of cholera, so that although now inhabiting a part of the country a considerable distance away from that of the Syntengs, it is not unlikely that they were originally connected with the latter more closely.

Professor Kuhn comes to the conclusion that there is a distinct connection between Khasi, Mon or Talaing, Khmêr, and the other languages of Indo-China that have been mentioned, which is to be seen not only from similarities in some of the numerals, but from the convincing conformities of many other words of these languages. He goes on to add that more important than these contacts of the mono-syllabic languages of Indo-China with mono-syllabic Khasi is their affinity with the Kol, and Nancowry poly-syllabic languages and with that of the aboriginal inhabitants of Malacca, i.e. the languages of the so-called Orang-Utang, or men of the woods, Sakei, Semung, Orang-Benua, and others; and that although it is not, perhaps, permissible to derive at once from this connection the relation of the Khasi Mon-Khmêr mono-syllabic group with these poly-syllabic languages, it seems to be certain that a common substratum lies below a great portion of the Indo-Chinese languages as well as those of the Kol and Ho-Munda group. More important than connections between words is, as Dr. Grierson points out in his introduction to the Mon-Khmêr family, the order of the words in the sentence. In both Khasi and Mon
193 that order is subject, verb, object. Taking this fact in conjunc-
197 tion with the similarities of the Khasi and Mon vocabularies, we may conclude that it is proof positive of the connection between Khasi and Mon, or Talaing. In Munda, however, the order is subject, object, verb. This is a very important difference, for, as Dr. Grierson points out, "the order of words in a sentence follows the order of thought of the speaker; it follows therefore that the Mundas think in an order of ideas different

l: Gurdon E-4, 5 (no date) 1907 ART Khasi ART

from those of the Khasis and the Mons. Dr. Grierson comes to the same conclusion with respect to these languages as Professor Kuhn, which is as follows:—"Owing to the existence of these differences we should not be justified in assuming a common origin for the Mon-Khmér langs. on the one hand, and for the Munda, Nancowry, and Malacca languages on the other. We may, however, safely assume that there is at the bottom of all these tongues a common substratum, over which there have settled layers of the speeches of other peoples, differing in different localities. Nevertheless, this substratum was so firmly established as to prevent its being entirely hidden by them, and frequent undeniable traces of it are still discernible in languages spoken in widely distant tracts of Nearer and Further India. Of what language this original substratum consisted we are not yet in a position to say. Whatever it was, it covered a wide area, larger than the area covered by many families of languages in India at the present day. Languages with this common substratum are now spoken, not only in the modern Province of Assam, in Burma, Siam, Cambodia, and Anam, but also over the whole of Central India, as far west as the Berars." Grierson, having agreed regarding the existence of this common substratum, does not finally determine whether the ancient substratum was the parent of the present Munda languages, or of the Mon-Khmér language. He says, "It cannot have been the parent of both, but it is possible that it was the parent of neither." We are thus still in a state of uncertainty as to what was the origin of these languages.

The brief description which follows of some of the more prominent characteristics of the Khasi language is based chiefly on Sir Charles Lyall's skeleton Grammar contained in Vol. II. of Dr. Grierson's "Linguistic Survey of India." It does not pretend to be an exhaustive treatise on the language; for this students are referred to the excellent grammar compiled by the Rev. H. Roberts.

The Article.—There are four articles in Khasi; three in the singular, *u* (masculine), *ka* (feminine), and *i* (diminutive of both genders); and one in the plural for both genders, *ki*.

All Khasi nouns take a pronominal prefix to denote the gender, i.e. the third personal pronoun, *u* (masculine), *ka* (feminine),

The Nikhis appear to have borrowed a small portion of their vocabulary from the Khasis. The following are quoted as examples of possible common words:—

	Nikhis.	Khasis.
belly	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]
father	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]
the hair	[illegible]	[illegible]
national [illegible]	[illegible]	[illegible]

The Lyngam dialect differs so much from the standard of [illegible]. Dr. Grierson, on pages 17 to 19 of his Volume III. of the "Linguistic Survey of India," has indicated some of these differences which may be recapitulated here as follows. Some of the consonants vary considerably from those used in the standard dialect. There are also many minor differences of pronunciation. A man is a [illegible], not a [illegible], a son is a [illegible], not a [illegible]. Standard *ap* is often represented by *ej*. Thus [illegible] for *ship*, etc. A final *k* often appears as *h*, and an initial *k* as *p*. Thus [illegible] becomes in Lyngam *pnah*.

Jt Gordon E-4, 5 (no date) 1907 ART Khasi ART

Standard *ei* becomes *ee*. Thus *mein-mee*, *met*; *dei-dee*, *be necessary*. The articles are frequently omitted. The pronoun *u* is used for the plural as well as the singular, instead of the Standard plural *ki*. The diminutive *i* is used with inanimate nouns. This is also sometimes the case in the Standard form.

Nouns.—The postfix of the Accusative-dative is *ne* or *en*, often contracted to *i* instead of *in* (Standard). The postfix of the Dative is *hooma*, *hoom*, or *hoon*. The Standard Dative-locative postfix *ha* is also used, and may be spelt *ha* or *hy*. *Ta* or *to* are also found. For the genitive, besides the Standard *jong*, are found *ha*, *ma-ha*, *um*, and *um-mum*. *Ium-mum* and *um* also mean "from."

The plural sometimes takes the suffix *mut*.

Adjectives.—The usual word for male is *hoong*, and for "female" *hoothaw*, in place of the Standard *shyoong* and *kyrhai* respectively. The following are examples of comparison:—*Ee-ngyoong*, good; *Mei-ngyoong*, better; *U ngyoong*, best. The Standard *tom* is also used for the superlative.

Pronouns.—The Personal Pronouns are:—

Singular	Plural
1st Person, *ee*	*hynin*, *mynin*.
2nd Person, *mei*, *mee*	*phinon*.
3rd Person, *u*, *ju*, *u*, *ju*	*hon*.

The Nominative of the pronoun of the second person singular is given *mee-ee* *ha-mei*, and *mee-ee* *ma-mei*. The *mee* or *ha* is the Standard emphatic postfix *ma*.

Demonstrative Pronouns appear to be *ha*, *hei* that, and *mei*, or *mih*, this. *Ee* is used as a definite article in the phrase *ee pyrmai*, the earthquake.

The Relative Pronoun is *u-hah*, who.
Interrogative Pronouns are *mei*, *u-ing*, who? and *mei*, what?

Verbs.—The pronoun which is the subject of a verb may either precede or follow it. Thus *ee nip*, I strike; *nip hynin*, we strike. The words meaning to be are *ee*, *im*, and *mait* in addition to the Standard *long*. Like the Standard *dim*, *im*, corresponding to Syiemg *ee*, also means to have. As in the

9. Godwin-Austen G-3 (no date) 1872 A27 Khasi A27

194 etc., when employed at heavy labour. Very much more decent is it than the thin purse-like cloth worn by even the better class of Babus in Calcutta, which makes hardly any pretence of concealing the private parts. I can speak for the Garo women being particularly quiet and modest in their demeanour; and the young men on reaching a certain age, and until they marry, live and take their meals apart in a large house constructed for them; this is always the largest in the village, and where strangers are put up. This custom mitigates strongly against "their want of modesty", so often advanced, and proves, if anything, an advanced state of morality.

Again, in speaking of the Khasis and the looseness of their family and domestic relations, which are somewhat easy, the frequent changing of wives is not as common as might be supposed, and in the remoter villages I should say very rare. There is a very strong force which militates against its frequent practice. The men of these tribes select their wives not for beauty and delicacy, but for their well-developed forms and hard-working qualities—those who can carry heavy loads throughout the day; and the more children she begets the better for the pair: they can cultivate as these grow up a larger area, and live in greater comfort.

[195] In the *Calcutta Christian Observer*, March, 1852, is to be found one of the best papers on the Khasis, by the Rev. W. Pryse, who was attached to the Welsh Mission working both at Cherra Poonjee and Sylhet. A very good article appears in the *Calcutta Review* for 1858, vol. 27, being a review of the "Geology of the Khasi Hills, with Observations on the Meteorology and Ethnology of that District," by Thomas Oldham, Superintendent of the Geological Survey of India, a work containing much valuable and interesting matter. An Introduction to the Khasia Language, by the Rev. W. Pryse, is also included in the above review.

196 The various ways in which the word Khasi has been spelt by different writers has so little resembled every as Kassyas, Cassias, Khasawah, Kasia, etc. The most correct has been adopted by the mission at Cherra Poonjee in their printed works in the language, and adopted in this paper.

194 197 They call themselves Ki Khasi, and their country Ka Ri Khasi,* and without going out of our way to seek for a derivation of this word, may it not be derived from the Hindustani "Ghasi"—grassy; the whole of the upper lands being of this nature, in contradiction to the forest-clad valleys and slopes of the outer hills both north and south. The Khasias never pro-

* Compare "Ghi", a mountain (Tibetan).

9: Godwin-Austen G-3 (no date) 1872 A87 Khasi A87

assume the hard G; and in all words of Hindustani origin this letter has the sound of K. 101 [97]

They are called by the tribes of Kúkis and Nágis on the west "Káro", the name they themselves have for the whole mass of hill people on their western side, the Gáros, though as we pass towards their confines, we find the names of local clans giving way to this general term which was not known to some of the villagers of West Nongstoin, who call the Gáros "Dikor."

The Gáro appellation for the Khásis is "Dikkil" or "Digil", and it was very interesting to find, after visiting the villages of both, that they mutually fear each other, and consequently border raids never occur. The Gáros owned that they feared the bow and arrow of their neighbour, a weapon they themselves are unacquainted with the use of.

The Khásis always point to the east as the quarter from which they emigrated, but there is very little, if any, similarity with the languages of the people now occupying the hills on that side. [178] [197]

Before entering further on the subject matter of this paper, I must request my hearers or readers to remember that having no knowledge colloquially of the Khasi language, the information I give was obtained from natives who understood either English or Hindustani well. The greater part of the information was given me by a very intelligent man, a native inspector of schools in the district; thus I hope that all errors that exist may be hereafter corrected by others who have been able to elucidate with greater exactness the meaning of their many different rites and superstitions. 115

Certainly the most striking objects of interest in the Khási Hills are the upright stone monuments that are to be seen all over the country; these, set up by the wayside, or in the villages, more frequently cutting the sky on prominent hills, with the large slabs horizontally set before them, at once recall the Druidical remains of our own island, northern France, etc., and lead one to marvel at the similarity of the custom, and to inquire its origin and design. Many who visit those hills take it at once for granted that they are the graves of illustrious men, or, after them, let the matter rest, or finally believe that the ashes of the dead, to whose memory the monoliths are erected, are buried under the flat kind of altar or dolmen seen in front. 764 211

It is always a very difficult matter to obtain information from semi-civilised people on such a subject as their religious rites, especially if the inquirer is ignorant of their language. A slight knowledge of Hindustani on the part of the Khásis villager, renders the attempt still more hopeless, and the information given quite erroneous.

IV. THE PLACE OF THE KHASI IN THE WORLD.

By

DAVID ROY

(1) The Khasi country lies in the hills of the province of Assam in North East India. Khasi clans are exogamous and matrilineal, and the Khasis speak a Mon-Khmer language.

(2) In speaking of the place of the Khasi in the world I intend to explain the Khasi's own view of his relation to other peoples of the world.*

(3) The Khasi is very conscious of his importance. He says a Khasi claims to be the centre of the world. The Khasi has acquired such a feeling of self-importance from his great confidence in himself; and this confidence he has derived from the position in which his relationship-terminology represents him as standing with respect to himself and the world around him. Or, rather, his relationship terms and language are an expression of his attitude and notions.

(4) The Khasi says—*Ka Kmain* (mother)

U Khasi (son) — *Ka Kmain* (mother)

Which (son)'s mother

Himself (male) — His sister (female)

He calls this the family. Then he says—

Ka Kmain Kha (Father's mother)

U Epa Kha (Father, Father's brother) (male) — *Ka Pia Kha* Father Father's sister (female)

* The writer of this is certainly a Khasi (Christian).

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

CHAPTER I

INTRODUCTION

The homeland of the Khasi is the hilly country situated in the northeast of India and known at present as the District of United Khasi and Jaintia Hills, under the Assam State Government. The area is bounded by the plains of the Kamrup and the Nowgong Districts to the north, by the Cachar Hills and East Pakistan (District of Sylhet) to the south, and by the United Mikir and North Cachar Hills Districts to the east. The Khasi and Jaintia Hills are divided politically into two subdivisions, with headquarters at Shillong for the Khasi Hills, and at Jowai for the Jaintia Hills, respectively. The peoples of both subdivisions are called "Khasi" in a broad sense, and are distinctly marked off from other neighbouring tribes and peoples by language and social structure. The population of the Khasi in the District is 363,599 (*Census of India, 1951, Assam*). Their language belongs to one of the Mon group of the Austro-Asiatic family to which the Munda in central India also belongs.[1]

Though all Khasis share fundamentally the same language and social structure, their culture, dialects, economy, social usage, and political organization vary greatly, owing to the ecological and politico-historical differences among them. The United Khasi and Jaintia Hills are much higher than the neighbouring Garo Hills. The plateau of the Khasi Hills ranges from about 4,000 feet to 6,000 feet, of which

1 The *Census of India, 1951, Assam*, makes the following remarks on their language: "Their nearest kinsmen have been discovered to be the Palaungs, a tribe inhabiting one of the Shan States to the northeast of Mandalay on the middle Salween. Later the relationship of the Khasi language has been traced not only to the Mon-Khmer language, but also to the Nicobarese and several dialects spoken by some tribes in the Malay Peninsula. In Assam, this special form of speech is only found in the Khasi and Jaintia while nearly all the other primitive languages with which it is surrounded belong to the great Bodo family. The Khasi language is the only member of the Mon-Khmer family which possesses a grammatical gender distinguishing all nouns as masculine and feminine, and here also the feminine nouns numerically preponderate."

necessary. The chances of acquiring a piece of land nowadays are small, except for very successful men, and usually the size of the plot is only just enough to maintain one household. When this land is passed on to the next generation, the youngest daughter will hold the title to it. This fact tends to exclude married elder sisters from the right to use the land, since it is not sufficient for more than one household. Thus the ultimogeniture succession rule seems to have developed more sharply and to have encouraged limited inheritance in conjunction with the shortage of land. 178 423 428

This tendency creates unbalance in the economy of the households within a community. It is a usual picture in Khasi villages, for the bigger and well-built houses to be occupied by the youngest daughter's family, while the elder sisters reside in poor huts. Youngest daughters are usually landowners, while their elder sisters have often to become day-labourers after their marriage, unless their husbands are capable men, or their fathers wealthy enough to give them some share of their acquired property. On the whole, the variations at present between rich and poor are considerable in a Khasi community, in comparison with that of the Garo, where the economic condition of each household in a village is more or less similar. These differences are not only a matter of economic organization but arise from the nature of each social structure. 178 184 423 428 556 [171]

The economic and social patterns of Sohkynduh and Kongton are very similar, but their dialects are slightly different: my interpreter, who came from Cherrapunje, could work quite well at Sohkynduh, but at Kongton he found some difficulty, especially with the speech of the old men, and with their religious expressions. The head man of Kongton, who was quite accustomed to the Cherra dialect, acted as an interpreter for us. Such differences in dialect in the Khasi Hills are common phenomena; it is said that every valley has its own dialect. Differences are found not only in speaking, but also, to a certain extent, in culture and in social usages. 197 [124]

22. Village Endogamy

One of the outstanding features of Khasi social organization is the predominant tendency of endogamy on the level of the village, which contrasts with the structural orientation of the Garo village exogamy. This is closely connected with the distributions of clans and the nature of the descent groups. 582 621 [171]

The Khasi population consists of a number of *kur*, matrilineal clans, whose members consider themselves to be descended from a common ancestress. The members of the same *kur* have a common 614 [765] [769]

* The account of Khasi culture, contributed by Anne F. McCormack, is based on field work during 1956-58 in the United Khasi-Jaintia Hills District. The author wishes to emphasize that her data are on the upland Khasis who inhabit the centre of the District. She gratefully acknowledges support of the field work from the Department of Anthropology of the University of Chicago, the Wenner-Gren Foundation for Anthropological Research, Inc., and the Ford Foundation, for one of its Foreign Area Training Fellowships.

group of matrilineal and Mon-Khmer-speaking people who claim as their ancestral homeland the present-day United Khasi-Jaintia Hills District (within approximately 90° 47' and 92° 52' E. and 25° 5' and 26° 5' N.). This group includes the Jaintias (also Pnar or Synteng) in the southeast, who differ from the Khasis primarily in their duolocal residence pattern and less virulent forms of sorcery. (The Hadens in eastern Jaintia are a Kuki people.) It also includes the Lyngngams (also spelled Lyngngam) in the west, who practice migratory swidden agriculture and certain peculiar funerary rites, and are said by Ehrenfels (1955) to be culturally intermediate between Khasis and Garos. Finally, it includes Bhoi, War, and upland Khasis, which terms are primarily territorial. Bhoi country is the north-central part of the District, and is culturally complicated by the presence of Mikirs, Lahungs, and Nepalis. War country spans the entire southern length of the District, so that Wars divide into Jaintia Wars and Khasi Wars; of these, the Khasi Wars have traditionally transmitted property to sons as well as to daughters. The upland center of the District is the country of the Khasis proper, those whose culture provides the most useful model for interpreting the variations found elsewhere. [For general reference on all categories of Khasi culture, cf. Costa 1936 and 1937, also Gordon 1937, especially for data on regional variations.] **Geography.** The District is 5,334 square miles of hilly tableland, intricately dissected by numerous rivers, and marked by significant ecological variation over very short distances. The tablelands step gently downward north from Shillong Peak, which at 6,445 feet is the highest point in the District, and over about 35 miles ease into the Brahmaputra valley where this is some 250 feet above sea level. To the south, the land slopes more steeply downward for about 20 miles, and then drops abruptly, in cliff and steep-slope formations, to the Ganges sea-level delta that begins at its north with Sylhet. The annual southwest monsoons drop torrential rains around Cherrapunji and Mawsynram villages (for Cherrapunji, a record 805 inches in 1961), but then, reaching Shillong 35 miles to the northeast, provide only about 100 inches per year. Rainfall is again greater in Bhoi, which shares the Brahmaputra valley climate. Climate is temperate on the high Shillong plateau, where it seldom freezes and seldom snows. To the north, climate becomes subtropical; forest is jungly, and fauna abound. The climate to the south is also subtropical. [Cf. Hooker 1891, chap. XXIX.] **Linguistic affiliation.** Khasi is one of the major Mon-Khmer languages, related to Mon, Khmer, Semang-Sakai, Nicobarese, and Palaung-Wa. The major Khasi dialects are Khasi, Jaintia, and Lyngngam, to which Grierson adds War. Further minor variations occur from village to village. The Khasis had no script until 1842, when the roman alphabet was successfully applied to the Cherrapunji dialect of Khasi proper. [Cf. Rabel 1961, Grierson 1903-28: 2; March 1862.]

593 wedlock go to the wife and becomes her property; but all other
428 property is inalienable, and reverts to his family, as also does his corpse air death.

771 'RELIGION.—The religion of the Khásis is demon-worship, or a jumbled enchantments muttered by priests who are sorcerers. They invoke evil spirits as the deputies of God and the instruments
775 of His pleasure or displeasure. The Khásis believe in metempsychosis or the transmigration of souls. After death, human beings are transmuted into monkeys, crabs, tortoises, frogs, etc. Though a future state is not denied, it is treated with absolute indifference, as beyond the sphere of responsibility; all rites, ceremonies, and observances bear reference to the welfare of mankind in this world. The spirits of their departed relatives and ancestors are invoked only in so far as they are considered to influence and have power
764 over the present life. The Khásis burn their dead, and collect the ashes in urns, which are kept under a slab raised on four others enclosing space. These monuments are of various kinds and sizes —one for individuals, another for a family, and another for a whole
614 clan. There is no caste system, but each clan is called after some object common, as the Oak clan, the Crab clan, etc., and these names call certain restrictions beyond which intermarriage is
771 forbidden. The Khásí religion may be briefly described as the practice of forms to cure diseases, and to avert misfortunes of all kinds, by means of ascertaining the name of the demon who is the author of evil, and the kind of sacrifice necessary to appease it.

797 'CHRISTIANITY.—The Welsh Mission has been labouring amongst the Khásis and Syntengs for thirty-two years. The Christian number about 1000 [according to the Census of 1891, the total number of native converts in the District is only 83]. There are four central stations—Cherrá, Shillú, Shillong, and Jowai —and twenty-three churches. Translations of the whole of the New Testament, and a portion of the Old, are now (1896) going to press, besides other religious books.

197 'LANGUAGE.—The definitions generally given of monosyllabic languages are far from adequate to enable us to assign to the
193 Khásí tongue its position amongst the Indo-Chinese family of speech. Still, in the absence of a better terminology, it may be described as monosyllabic in the agglutinative stage. The monosyllabic element greatly predominates. By far the larger number of the compounds are mere agglutinations (e.g. modified

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

sense) or juxtapositions of roots which have not thereby suffered either elocution or absorption—that is to say, they are all, with a few exceptions, reducible to their constituent root words, which are still "current coin," and retain their power as independent vocables. The cases in which elocution and "fusion" of roots have taken place are confined to—(1) the noun prefix *jaw*, expressing abstract ideas; (2) the verbal prefixes *kyn*, *kyn*, *kyn*, *ryn*, *ryn*, *kyn*, *kyr*, *kyr*, *kyr*, *kyr*, *ryr*, *kyr*, expressing causation, intensification, and contrariety. The language is found purest at Cherra Punji. The Khásás have no written character or literature of any kind of their own. Tradition says that all was lost while they were yet masters of the plains, whence they were driven by a general catastrophe or deluge to their present fastnesses in the hills. The following works on the language have been published: *Khásí Grammar*, *Anglo-Khásí Dictionary*, *Khásí Primer* (Parts I. and II., with Vocabulary),—all issued by the Calcutta School-Book Society; *Khásí English Dictionary* (in preparation), and an *Anglo-Khásí First Book*.

197 193 212 173 113

"Customs regarding Inheritance.—A Khásí, whether married or single, if he makes his mother's house his home, is said to be coming for his *kor*, *i.e.* for his mother, or his brothers and sisters, or his mother's relatives. On his death his property goes to his mother, if living; if not, to the grandmother; if she is not living, then to his sisters; should his sisters also be dead, to his sisters' children. Should the deceased have left no sisters, the property goes to the brothers; should he have no brothers or should they be dead, the property descends to his aunts, or to their children if the aunts are not living; should the aunts have left no children, the property descends to the grandmother's or great-grandmother's sisters or children. The property of a female on her death goes to her mother, if she deceased have no children; or if the mother of the deceased is not living, the property goes to the brothers and sisters; if the sisters are dead, then their children become the heirs. If there are no such children, the property devolves as in the case of males. When a man is not living in his mother's house, but in that of his wife, he cares for his wife and children. On his death his property descends to his wife, with the exception of the ornaments and clothing worn by him during his lifetime, which go to the brothers and sisters or other relatives of the deceased. Should the deceased have been a widower, the property goes to his children, and in their absence

428

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

105 It will here be recalled that the Khasi are a matrilineal agricultural
[175] people, pre-litterate until the advent of the British in the sixth decade of
[197] the 19th century, organized under democratically ruling *siew*, or Khasi
princes and chieftains and speaking an Austro-Asiatic language [14]. Their
144 physical affinities are unmistakably mongoloid and quite distinct from the Assamese speaking plains-Indians, — but not from the other mountaineers of Assam, Nepal and even Burmah or China, with whom they feel to be more closely related, as with the Indian plainspeople, as some of the tribal designations in the following lists of terms for Non-Khasi testifies (comp. No. 41 as against No. 42, 43 and 43/*a-c*).

114 In the collection of the material, I was hampered by my inability to
122 pick up the Khasi language sufficiently quickly, for conversation without the help of an interpreter, but on the other hand greatly eased by generous and voluntary assistance on the part of several Khasi friends, especially U Ekiman Singh, the President, Unitarian Union, Khasi- and Jaintai Hills and his (Khasi) wife, Ka Austria [15], who offered me hospitality in their house at Maw Syn Jri, during my stay there. Dr. H. Lyngdoh, Shillong, the author of detailed accounts on Khasi religious ceremonial and institutions [16], U Jeeban Roy, a leading Pnar gentleman of Jowei in the Jaintia Hills, Ka Ellen Giri, Principal, Govt. Basic Education Training Centre, Malki, Shillong, Ka Kongmen, Shillong, and U David Roy, Prime Minister (retd.), and a number of hospitable Wär Khasi and Wär-Jaintia pan-leaf cultivators in the southern slopes of the Khasi- and Jaintia Hills, especially from the villages Mawlat and Pada, also helped me greatly in my task. My thanks are due to all of them.

101 The data, submitted and briefly described in this paper were thus
119 collected in four different areas.

1. The South-eastern corner of the Khasi-Hills (plateau-area),
2. the southern slopes of the Khasi Hills, the "Wär-Khasi country" between the Khasi plateau proper and the northern boundary of East Pakistan,
3. the central plateau of the Jaintia Hills, round its capital market Jowei, and
4. the southern slopes of the Jaintia Hills, the "Wär-Jaintia country" between these and a section of the northern boundary of East Pakistan, further to the East than area 2.

197 Slightly different Khasi dialects are spoken in these four regions, Jaintia (Pnar or "Syntong") and Wär-Jaintia being more akin to each other, similarly as Plateau-Khasi and Wär-Khasi are.

101 The Pnar or Jaintias ("Syntong" is a slightly opprobious designation,
195 used by the Plateau-Khasi for these, their eastern neighbours) look back

[14] SCHMIDT (1906).

[553] [15] So named, because Austria was much in the news at the time of her birth, during the first world war, — a fact which illustrates the Khasi peculiarity to use either all her inventories as names for children, or to adopt such, from the Khasi point of view, outlandish words like: "Ka Austria" or "Ka Mediterranean Sea" as names for their children.

[16] LYNGDOH (1937).

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1906. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betel-nut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmaker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

601 Term 19 and 20 — *para ïur* and *para kha*; the former for all cousins and half-siblings on the mother's and the latter for those on the father's side, show the consciousness of the matrilineal clan-affinity and the patrilineal biological relationship through their classificatory subdivision, which is also true of

Term 21, 21/a and 21/b; — the *bakha* are cross-cousins.

Term 21/b shows special consideration for the older paternal male cousin of the first degree, who is addressed as *bah* whilst the older maternal male cousin of the first degree is addressed as *kong*, like the older female cousins on both sides.

[192] Term 23, 23/a, 23/b, — *kniew* for grandchildren would appear to mean: dog's children. It has, however, been pointed out to me, by Khasi friends, that the Khasi word for dog is *kaew*; not *kniew*. The Pnar (Jaintia) pronunciation *ki kaw* for grandchildren, and the occasionally occuring designation of great-grandchildren as "cats children" (term 24) and of great-great-grandchildren as "rats children" (term 25), however, would appear rather to suggest the derivation of *kkaw kniew* from *kaew* — dog, than from a meaningless separate root.

[197] Term 24 — *kkaw miaw* (i. e. cats children) for great-grandchildren is used among Plateau Khasi families. BERNATZIK considers with CREDNER, E. LUNET DE LAJONQUIÈRE, MARANDAIN and EICHSTEDT the possibility that the name of the Meau has been derived from cats[96]. This is a hill tribe, speaking a language with some similarity to the Mon-Khmer group[97] (to which also the Khasi language belongs). The Meau are living not very far from the possible homeland of the Khasi around the region of S. China, N. Siam and Indo-China. If a parallel should here be assumed, the two complementary Khasi terms No. 23 (dogs children) and 25 (rats children) may appear to be formed on the basis of analogy with the term "cats children" as tribal self-designation. Another explanation, however, of this unusual kinship-term which was given to me by a Khasi friend, contented that each generation, seen from the ancestral parent's point of view, is as numerous as the young of the respective varieties of animals.

Term 25 — *kkaw kwai* (rats children) comments: — see: term 24, (supra).

601 Term 26 — *u ki* — *u kong* as a honorific term for the maternal uncles and the husbands of the elder sisters and elder female cousins on the maternal side, illustrates the great respect shown to male relatives on the mother's side by adding the masculine preposition *u* to the word *kong*, which generally signifies older female maternal relatives, but in this case, their husbands (comp. term 31/e). This usage of the term is reminiscent of the Brahmin ceremonies performed for male maternal ancestors, instead of for mothers, grandmothers, etc. It also tallies with my observations, otherwise obtained[98]

[96] BERNATZIK (1947), pp. 6, 7.

[97] BERNATZIK (1947), p. 555, though he denies the inclusion of the Meau into the Mon-Khmer group.

[98] EHRENFELS (1950), p. 19; (1951/4), pp. 3, 4, 5; (1951/5), pp. 72, 80, etc.

G 342 space about three quarters of the width of the house, was partitioned off by mat walls. It served as a room for the married couple. The unmarried women sleep near the fireplace; the young men in the bachelor's house. Adjacent to the room of the couple, a small door opened on a small roofed veranda with a low gallery (Plate X, 3) which had no exit. The rear post was at- [531] tractively carved. According to Dalton, the Garo have a special talent for this kind of work. The space under the house piles by the lower side of [231] the slope, at the end of the house, was used for the oxen. Higher up, where they had less space, they kept the pig sty.

The Garo, like the Kachin and also other mountain tribes, have a second smaller house on their fields, frequently far distant. They live in these houses during tillage time and also to guard the crops. According to Playfair they have in more recent days even shown a tendency to abandon the village houses permanently in favor of the field huts.

They try to build the huts as high above the ground as possible in order to have a wider view, but mainly as a protection of the occupants against nocturnal attacks by elephants. To achieve this the Garo often use high trees instead of piles and build their houses into the forked branch stumps (73).

73. In Playfair, p. 6 is an excellent illustration of such a tree house (borang). These tree houses, of course, have nothing to do with primitive customs (Schurtz, ibid., p. 433; Brigham, ibid., pp. 58 et seq.).

K 101 Bordering the settlements of the Garo in the
197 east live the Khasi, who linguistically must be linked to the Palaung, Wa, and Talaing in Burma.

[195] [196] [197] [198] [199] [200] [201] [202] objects are stored while that of the west (*Lyngam blang*) was meant exclusively for sacrificial goats. There is a very big circular courtyard in front of the building where the members of the royal family as also other boys and spectators hold a ritual dance. The function is always held during the month period of May or June and the actual dates are fixed in consultation with the Chief priest (*Lolkhar*) in such a way that the first day—*Pomlah*[8] always coincides with the market day of Shillong Chota Bazar. The dates of the festival is then communicated to the in-charge of different units of his territory, through a wooden stick '*Lyrwah*' having a few knots of cane-strips, as a form of summons for attending the festival for five days at least along with subjects under their jurisdiction.

Important Functionary

[203] [204] [205] [206] [207] The responsibility of performing this ritual rests on the High-priestess (*Ka Siem Sad*) who is succeeded by her eldest daughter. Different ritual objects are procured by her, well in advance and it is obligatory on her part to join the ceremonial dancing, in which her daughter may also officiate on her behalf. U Shillong is worshipped by the chief priest while the other ceremonies are conducted by lesser priests. The musicians (*Dhaka*) besides their normal duties, take part in the worship of the ancestors and they are presented with silk turban, jacket, cloth, by the ruling family for the services rendered during the festival. The *Siem* has no special role except to supervise and evoke U Shillong for the welfare of the community. She is required to perform certain sacrifices, failing which her heir-apparent (*Siem Lyngdoh*) does the same. He along with his sister (High priestess) abstain from taking rice during the period of celebration presumably to observe the sanctity of this festival as also to ensure the successful conclusion of the function.

Ritual Sacrifices

[208] [209] [210] The festival derives its name from the sacrifice of a large number of goats some of which were supplied from the State fund and from different units of the territory. Formerly as too fifty goats were required and each unit had a specific allotment but owing to the economic difficulty that the Khasis are experiencing, the number of goats sacrificed hardly exceeds twenty-five. The goats collected from the different units are presented to the Chief at the midnight of the third day. Rice-beer, dried fish, fermented rice, betel leaves together with rum are also important ritual objects in this celebration.

Commencement of the Festival

[211] [212] The commencement of the festival was marked by the distribution of drink, fish (not dried) to the persons assembled on the occasion, in the evening of [illegible] by the Chief priest over the five piece of central hall known as *Ka sub-ka sha*

Khasi religion. If the marriage has been celebrated according to the *pynkhiar synjiat* rite, a *lolong* (go-between) is necessary on each side, also the *lei*, or maternal uncles of the parties, to witness the divorce. In other cases the presence of the *lolong* is unnecessary, but some acquaintances and friends as well as the relatives on both sides should witness the ceremony. The husband and the wife each bring five cowries (*shis*), or, more commonly nowadays, five pice. The wife gives her five cowries or pice to her husband, who places them with his, and then returns the five cowries or coins to his wife, together with his own five. The wife then returns the ten shells or coins to the husband who throws them on the ground. A crier (a *sing pyrtu shongi*) then goes round the village to proclaim the divorce, using the following words:—

"Kaw—hear, oh villagers, that U—— and K—— have become separated in the presence of the elders. Hei! thou, oh, young man, canst go and make love to Ka—— for she is now unmarried (*khynraw*), and thou, oh, spinster, canst make love to U——. Hei! there is no lot or hindrance from henceforth." Among the Khasis divorce must be by mutual consent, and the ceremony must take place in the open air. Until the divorce ceremony has been performed as above described, neither husband nor wife can marry again, but after it has taken place, either can remarry, but not within the family of the divorced husband or wife. In the event of a husband or wife being absent for a long period, say ten years, without any communication having been received from either of them, a divorce ceremony is performed by the relatives on his or her behalf. It is stated by U *Joshua Roy* that the rule of monogamy is not so strict for the husband as it is for the wife, he can contract an informal alliance with another woman, the only prohibition being that she must not belong to the original wife's village. Such a wife is called *ka tyngo tok*, literally, stolen wife, in contradistinction to the legally married wife (*ka tyngo kmai*). The children by the unmarried wife are called *ki khaw kliar* (children from the top). By *khlirym* from the top, is understood to mean children from the branches not from the root (*kyrpi*) of the tree. Such children cannot claim [illegible]

[illegible] See page 18, "Ka Niam Khasi." (U Joshua Roy.)

respective villages; sometimes, however, there are disputes re- 423
garding those lands between the different villages. Such dis- 692
putes are settled by the Lyngam Sirdars of villages or by the Sirdars sitting with the two Lyngskors of the Siemship. If the disputes cannot be settled by these officials to the satisfaction of the parties, the latter are taken by the Lyngskors and Sirdars to the Siem of Nongstoin, who tries the case with the aid of the State mantris.

LAWS REGARDING OTHER PROPERTY.

There is no separate law applying to personal property, as opposed to real property, amongst the Khasis. 423

DECISION OF DISPUTES.

Khasi Courts of Judicature.

In the first place a complaint is made before the Siem, 694
or chief, against a certain party or parties. The facts and 628
circumstances of the case are then detailed before the chief and his headmen, the ostensible object being to attempt to bring about a compromise between the parties. If no recon- 203
ciliation can be effected, a crier (*u nong pyrta shnong*), or in the 694
Jaintia Hills a *sangot*, is sent out to proclaim at the top of his voice the durbar which is to assemble the following evening. He proceeds to cry the durbar in the evening when all the inhabitants have returned to the village from their usual daily pursuits. With a loud premonitory yell the crier makes use of the following formula *:—

"*Kaw!* thou, a fellow-villager; thou, a fellow-creature; thou, an old man; thou, who art grown up; thou, who art young; thou, a boy; thou, a child; thou, an infant; thou, who art little; thou, who art great. *Hei!* because there is a contest. *Hei!* for to cause to sit together. *Hei!* for to cause to deliberate. *Hei!* for to give intelligence together. *Hei!* about to assemble in durbar. *Hei!* for to listen attentively. *Hei!* ye are forbidden. *Hei!* ye are stopped to draw water then

* What follows is a literal translation of the Khasi.

1:Gurdon E-4, 5 (no date) 1907 AR? Khasi AR?

203 694 not to cut firewood then; *Hei!* to go no cooking then; *Hei!* to go to work then; *Hei!* to go a journey then; *Hei!* to descend to the valley then; *Hei!* he who has a pouch. *Hei!* he who has a bag. *Hei!* now come forth. *Hei!* now appear. *Hei!* the hearing then is to be all in company. *Hei!* the listening attentively then is to be all together. *Hei!* for his own king. *Hei!* for his own lord, lest destruction has come; lest wearing away has overtaken us. *Kaw!* come forth now fellow mates."

This proclamation is called *khong shong*, and by it all are stopped from going anywhere from the village the following day. Anybody who disregards the prohibition is liable to fine. [687] 695 The following day, towards evening, all the grown-up males of the village assemble at the durbar ground, the site of which is marked in some villages by rows of flat stones, arranged in an irregular circle, upon which the durbaris sit. The proceedings are opened by one of the headmen, who makes a long speech; then others follow, touching upon all sorts of irrelevant matters, but throwing out hints, now and then, bearing on the subject of accusation. By degrees the debate waxes warmer, and the parties get nearer the point. Then the complainant and the defendant each of them throw down on the ground a turban, or a bag containing betel and pan, lime, &c., in front of the durbar. These are regarded as the pledges of the respective parties and their representatives in the suit; they receive the name of *mawlo* (hence the Khasi term *ar khong mawlo* for the two contending parties in the suit). There are pleaders on both sides called *'ior ashi*, who address the durbar in lengthy speeches, the Siem being the judge and the whole body of the durbar the jury. Witnesses are examined by the parties; in former times they were sworn on a pinch of salt placed on a sword. The most sacred and most binding form of oath, however, is sworn on a *khong* (a hollow gourd containing liquor). As, however, the latter form of oath is regarded by the Khasis as a most serious ordeal, it will be described separately. The durbar sometimes goes on for several days. At length the 695 finding of the durbar is taken, after the Siem has summed up, and sentence is pronounced, which generally consists of a fine in money, almost always accompanied by an order to the being

[illegible]

Addition, but Christian influence has confined to down underground the consumption by women and children habituated arts. The only industrial arts are [illegible] practised in all households were a cotton [illegible] company and a simple utilitarian hardware. Other arts were less low, and were practised in village specialities: the washing and washing of iron ore and the forging of iron; there, brown shrub, and coal; [illegible] pots (upland Khasis); the spinning of cotton thread (Nongpoh village, Jaintia); the dyeing of cotton thread; and the weaving of cloth (Jaintia, Khasi, Langpoh, West); the spinning and weaving of fine silk (Mawsynram and Sohagmong villages, Khasi and Jaintia); and the basal manufacture, without wheel, of painted earthenware pots (Lawar village, Jaintia). Embroidery and the production of cotton goods have much died out through the competition of machine-made goods. Carpentry has greatly improved, by introduction of major improvements in the forging and tempering, on sewing machines, of much-made pattern for both years. [illegible]

Trade. Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The basis of market attendance for the residents of any particular village can be roughly demarcated by their running the days of their week which are called after the active markets. The exception is the large market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The staple exports consist of bear some local farm produce, also other essentials like betel nut, and the food and the [illegible] which serve as sources of social amusement. The big markets contain not only imported products and manufactures but also products from distant parts of the hills, brought for sale by travelling middlemen. There is also substantial trade from the hills to the [illegible], in potatoes, pears, bidis, lac, cotton, [illegible] the wood of the tal tree, the silk thread, lime stone, coal, iron, betel leaf, betel nut, pan leaves, tamarind, major cane, oranges, [illegible] tamarind, and chillies. From the plains to the hills, there is trade in dried fish, purified rice, salt, cooking oil, kerosene, matches, tea, sugar, [illegible], flour, machine-made cloth, [illegible], metal pots, crockery, petroleum objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centres for recreation (including archery competitions), courtship, re-affirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [illegible] Division of labour. Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, hawking and selling large sum of land and gold, carpentry and mining, and driving and labouring on motor vehicles. Men also take much

1:Gordon E-4, 5 (no date) ??07 AR? Khasi AR?

to his own matriarchal stock, and at his death his bones are deposited in the ossuaries of his mother's kin. In Jowai he neither lives nor eats in his wife's house, but visits it only after dark (p. 76). In the veneration of ancestors, which is the foundation of the tribal piety, the primal ancestress (*Ka Iawbei*) and her brother are the only persons regarded. The flat memorial stones set up to perpetuate the memory of the dead are called after the woman who represents the clan (*mawbiar Iyaiñei*, p. 130), and the standing stones ranged behind them are dedicated to the male kinsmen on the mother's side.

In harmony with this scheme of ancestor worship, the other spirits to whom propitiation is offered are mainly female, though here male personages also figure (pp. 108—109). The powers of sickness and death are all female, and these are those most frequently worshipped (p. 107). The two protectors of the household are goddesses (p. 112), though with them is also revered the first father of the clan, *U Thlendang*.

Priestesses assist at all sacrifices, and the male officiants are only their deputies (p. 121); in one important state, Khyrim, the High Priestess and actual head of the State is a woman, who combines in her person sacerdotal and regal functions (p. 79).

The Khasi language, so far as known, is the only member of the Mon-Khmer family which possesses a grammatical gender, distinguishing all nouns as masculine and feminine; and here also the feminine noun immensely preponderates (p. 208). The pronouns of the second (*ñi*, *phi*) and third person (*i*, *hi*) have separate forms for the sexes in the singular, but in the plural only one is used (*phi*, *ki*), and this is the plural form of the feminine singular.

It may perhaps be ascribed to the pre-eminence

1:Garden E-4,5 (no date) 1907 AR7 Khasi AR7

117 diviners in ancient Hellas.* This method has (with
171 much else in Khasi practice) been adopted by the
former subjects of the Khasis, the Mikirs; but it does
not appear to be prevalent among any other of the
animistic tribes within the boundaries of India.

20 The third remarkable feature of Khasi usage is the
171 custom, which prevails to this day, of setting up great
74 memorials of rough stone, of the same style and
character as the *menhirs* and *dolmens* which are found
in Western Europe, Northern Africa, and Western
Asia. It is very surprising to a visitor, unprepared
for the sight by previous information, to find himself on
arrival at the plateau in the midst of great groups of
standing and table stones exactly like those he may
have seen in Brittany, the Channel Islands, the south
of England, or the Western Isles. Unfortunately the
great earthquake of June 1897 overthrew many of the
finest of these megalithic monuments; but several still
remain, and of these Major Garden has given an excel-
lent description (pp. 144 *sqq.*), with an explanation
of the different forms which they assume and the
objects with which they are erected. Other races in
India besides the Khasis set up stone memorials; but
none, perhaps, to the same extent or with the same
systematic purpose and arrangement.

119 In conclusion, I have only to commend this work to
the consideration of all interested in the accurate and
detailed description of primitive customs. I lived
myself for many years among the Khasis, and en-
deavoured to find out what I could about them; but
much of what Major Garden records is new to me,
though the book generally agrees with what I was able-

* Called *gonoromi*: one of the last books of the Orphic cycle was entitled in *gonoromi*.

I: Gordon E-4, 5 (no date) 1997 ART Khasi ART

Khasis are connected with people who inhabited the Malay Peninsula and Chota Nagpur at the time of the Stone Age.* That these people were what Logan calls the Mon-Anam may possibly be the case. Mr. Peal goes on to state, "the discovery is interesting for other reasons, it possibly amounts to a demonstration that Logan (who it is believed was the first to draw attention to the points of resemblance between the languages of the Mon-Anam or Mon-Khasis and those of the Munda and the Khasis) was correct in assuming that at one time the Mon-Anam race and influence extended from the Vindyas all over the Ganges basin, even over Assam, the northern border of the Ultra Indian Peninsula." Mr. Peal then remarks that the Eastern Naga of the Tirap, Nawatik, and Sonkay group "are strikingly like them (i.e. the Mon-Anam race), in many respects, the women being particularly robust, with pale yellow and at times ruddy cheeks." The interesting statement follows that the men wear the Khasi Mikir short-cloth coat. Under the heading of dress this will be found described as a garment which leaves the neck and arm bare, with a fringe at the bottom and with a row of tassels across the chest, the coat being fastened by frogs in front. It is a garment of a distinctive character and cannot be mistaken; it used to be worn largely by the Khasis, and is still used extensively by the Syntengs and Lyngams and by the Mikirs, and that it should have been found amongst these Eastern Naga is certainly remarkable. It is to be regretted that the investigations of the Ethnographical Survey, as at present conducted, have not extended to these Eastern Naga, who inhabit tracts either outside British territory or in very remote places on its confines, so that we are at present unable to state whether any of these tribes possess other points of affinity, as

* It is interesting to compare the remarks of M. Aymonier in his volume iii of "Le Cambodge." He writes as follows:—"Mais en Indo-Chine ou toutes parties connues, ou qui les intéressent, au Cambodge du moins, aujourd'hui comme les peuples les plus éloignés du globe, 'les traits de bouche.' Ce sont ici des lèvres de lèpre minéralisée ou de la pierre polie, dont la présence appartiennent au type repoussé au toute la terre. Diversion de ces cultes, d'où naquelle, parvenu le premier, en même d'autchoses particulières, permanent appartenir au groupe à l'Indo-Chine et à la presqu'île indonésienne. Du Kamchatka dans un premier milieu, aux antipodes, d'une communauté d'origine des populations primitives des deux presqu'îles, ou en toute geographique."

1:Garden E-4, 5 (no date) 1907 AR7 Khasi AR7

/99 regards social customs, with the Khasis; but it will be noticed
/100 in the chapter dealing with memorial stones that some of the
/101 Naga tribes are in the habit of erecting monoliths somewhat similar in character to those of the Khasis, and that the Miklos (who wear the Khasi sleeveless coat), erect memorial stones exactly similar to those of the Khasis. The evidence seems to suggest a theory that the Mon-Khmer race, including of course the Khasis, occupied at one time a much larger area in the mountainous country to the south of the Brahmaputra in Assam than it does at present. Further references will be found to this
/102 point in the section dealing with memorial stones. The fact
/103 that the Ho-Munda of Chota Nagpur also erect memorial stones and that they possess dwelling customs very similar to those of the Khasis, has also been noticed in the same chapter. We have, therefore, the following points of similarity as regards customs between the Khasis on the one hand, certain Eastern Naga tribes, the Miklos, and the earliest inhabitants of the Malay Peninsula on the other :—

(a) Peculiarly shaped box, i.e. the box with far-projecting shoulders	1. Khasis. 2. Certain Eastern Naga tribes. 3. The earliest inhabitants of the Malay Peninsula. 4. The earliest inhabitants of Chota Nagpur (the Ho-Munda ?)
(b) Sleeveless coat	1. Khasis. 2. Miklos. 3. Certain Eastern Naga tribes.
(c) Memorial stones	1. Khasis. 2. Miklos. 3. Certain Eastern Naga tribes. 4. Ho-Munda of Chota Nagpur.

/97 I wish to draw no definite conclusions from the above facts,
/98 but they are certainly worth considering with reference to Logan's theory as stated by Peal: the theory being based on Logan's philological inquiries. Thanks to the labours of Grierson, Logan, and Kuhn in the linguistic field, we know that the languages of the Mon-Khmer group in Burma and the Malay Peninsula are intimately connected with Khasi. I say, intimately, advisedly, for not only are roots of words seen to be similar, but the order of the words in the sentence is found to be the same, indicating that both these people think in the same order when wishing to express themselves by speech,

work is done. In order to ascend to a Bhoi house, you have to climb up a notched pole. The Bhoia carries a he-goat and a fowl to *Bit-lapling* (Khasi, *Rumiow* God), the household god, when they build a new house.

VILLAGES.

Unlike the Naga and Kukis, the Khasis do not build their villages on the extreme summits of hills, but a little below the tops, generally in small depressions, in order to obtain some protection from the strong winds and storms which prevail in these hills at certain times of the year. According to the late U Jaubon Roy, it is *ensy*, or taboo, to the Khasis to build a house on the last eminence of a range of hills, this custom having perhaps arisen owing to the necessity of locating villages with reference to their defence against an enemy. Khasis build their houses fairly close together, but not so close as houses in the Bhoi and Lyngngam villages. Khasis seldom change the sites of their villages, to which they are very much attached, where, as a rule, the family tombs are standing and the *menhiras* or memorial stones. In many villages stone circles and memorial stones are to be seen which from their appearance show that the villages have been there for many generations. During the Jaintia rebellion the village of Jowai was almost entirely destroyed, but as soon as the rebellion was over the people returned to the old site and rebuilt their village. Similarly, after the earthquake, the ancient village sites were not abandoned in many cases, but the people rebuilt their houses in their former positions, although in Shillong and Cherrapunji they rebuilt the walls of the houses of wooden materials instead of stone. There is no such thing as a specially reserved area in the village for the Sirdar and the nobility, all the people, rich or poor, living together in one village, their houses being scattered about indiscriminately. To the democratic Khasi the idea of the Sirdar living apart from his people would be repugnant. In the vicinity of the Khasi villages, often just below the brow of the hill to the leeward side, are to be seen dark woods of oak

the Wáe country, it will be necessary to describe the land tenures and laws regarding land of each of these divisions separately. As land is always *jhumed* by the Bhoie and Lyngngam from year to year, customs regarding land with these people are naturally very simple. Taking land in the high plateau of the Khasi Hills first:—The lands are classified under two main divisions, (a) public and (b) private lands. The following are the different descriptions of lands in the first division:—

Ka ri Raj, or *ka ri Siem*, which are Siem's, or Crown lands. These lands are intended for the support of the Siem family, they cannot be alienated. The Siems are, however, precluded by custom from levying a land tax on persons who cultivate such lands, the relation of landlord and tenant between the latter and their chiefs being unknown.

Ka ri Lyngdoh.—These lands are for the support of the Lyngdohs or priests of the State. In some Siemships, as in Mawiong Siemship, paddy is grown on these lands from which rice is obtained for the State pujas.

Ki skoong, or village lands.—These lands are set apart to provide a supply of firewood, thatching grass, &c., and are the property of the village. The inhabitants of other villages are not allowed to enjoy the produce of such lands. Such lands can be cultivated by ryots of the village, but the latter possess only occupancy rights, and cannot transfer them.

Ki lawlynkong.—These are sacred groves, situated generally near the summit of hills, composed of oak and rhododendron trees, which are held sacred (*kynkong*), it being an offence, or *sang*, for any one to cut timber in the grove, except for cremation purposes. These groves are the property of the villages.

(b.) Private Lands. These may be subdivided into *ri-kur*, or lands which are the property of the clan, and *ri kynthi*, family, or acquired landed property. In the Khasi Hills proper a very large proportion, certainly of the high lands, is the property of the clan; for instance, the high lands at Laitkor, which are the property of the Khar kongor and Kur kulong clans, whose ancestors the large memorial stones close to the Laitkor road commemorate, also the lands of the Thang Khew clan, and many others.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

cary, as in times of trouble. These offerings take the shape of articles of food which are theoretically partaken of by the shades of the deceased ancestors, the idea of making such offerings being very similar to that of the Hindus when they offer the "*pinda*," or cake, to nine generations of ancestors, i.e. to propitiate the shades of the departed, and to obtain their help thereby. U Hormu Bai Dienghah writes that, "the real religious demand" amongst the Khasis is the *ai ban*, or giving of food to the spirits of deceased ancestors, in order that the latter may aid the living members of the clan with their help, and bless them. To honour dead ancestors is the duty of every Khasi, and he who wilfully neglects this duty, is believed, will neither receive their help, nor be defended from the influence of the numerous spirits of evil in which the Khasis believe. Amongst the Syntengs, a few days after depositing the bones in the ancestral tomb, the ceremony of feeding the spirits of the dead is performed. At this ceremony there are some families which give two pigs for each person of the family who is dead, and there are some who give one. The pigs are taken to the *lang-sang*, or puja house of the clan. Presumably, pigs are usually offered to the shades only of those members of the family whose remains have been recently deposited in the clan cromlech. In the chapter dealing with memorial stones the reader will notice how many of them are erected to the memory of deceased ancestors, and how they bear the names of such ancestors, e.g. *Ka Iawbei* (the first grandmother), *U Sniaiain*, or *U kni ranghah* (the first maternal uncle). It was the custom in former days to make offerings of food upon the flat table-stones to the spirits of the deceased ancestors, and this is still the case in places in the interior of the district. This practice, however, may be said to be largely dying out, it being now commonly the custom to make the offerings in the house, either annually, or at times when it is thought necessary to invoke the aid of the departed. Such acts of devotion may well be said to partake of the nature of worship. As has been the case in other countries, and amongst other people, it is possible that the Khasi gods of to-day are merely the spirits of glorified deceased ancestors transfigured, as has happened with some of the gods of the

being in a position to help his descendant in times of trouble. The same thought underlies the extreme reverence with which *Ka Iawbei* is regarded. Thus we see a striking point of resemblance between the Khasi ancestor-worship and the ancient Shinto cult of Japan, as described by Mr. Lafcadio Hearn. *U Swid-Nio*, or *u Kwi Blophah*, the first maternal uncle, i.e. the elder brother of *Ka Iawbei*, is also much revered. It will also be noticed under the heading of memorial stones that the great central upright monolith of the *mawbynna*, or memorial stones, is erected in his honour. The influence of the *kwi*, or mother's elder brother, in the Khasi family is very great, for it is he who is the manager on behalf of the mother, his position in the Khasi family being very similar to that of the *karta* in the Hindu joint family. It is on this account that he is so much revered, and is honoured with a stone which is larger than the other up-right memorial stones after death. It will be seen in the article dealing with "the disposal of the dead," that at Cherra, on the occasion of the bestowal of the ashes in the cremation of the clan, a part of the elaborate ceremonies consists of the preparation of two effigies called *Ka Parem* and *U Tyngkop*, intended to represent *Ka Iawbei* (the first mother) and *U Swid-Nio* (the first maternal uncle). The Wars of Nongjri have a custom peculiar to themselves. They erect small thatched houses in their compounds, which they call *ling lawid*. When they worship their ancestors they deposit offerings of food in these houses, the idea being that the ancestors will feed on the offerings. These Wars do not erect memorial stones, nor do they collect the ashes of the clan in a common sepulchre; they deposit the ashes in circular cinerarie, each family, or *ring*, possessing one. It should further be noted with reference to the Khasi custom of *ai kaw*, or giving food to the spirits of deceased ancestors, that Dr. Frazer, in his "Golden Bough," has mentioned numerous instances of fruitwine being offered to the spirits of deceased ancestors by the tribes inhabiting the Malay Archipelago. (See pages 462-463 of the "Golden Bough.") Some other points of similarity in customs have already been noticed between the Khasis and certain Malay tribes.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

a similar custom prevalent amongst the Khyrwangs. The Nongtangs, in the Jaintia Hills, keep dead bodies sometimes as long as a month, until the *plor* or ceremonial dance has been performed. Hence they are called *Nong-tang*, or "stickers." Amongst the Lyngngams the dead body is kept for sometimes three or four months, or up to the time when a bull can be procured for a feast to the villagers. This feast is an essential, and, cattle being scarce in the Lyngngam country, there is often great delay in disposing of the body. Lyngngam villages at such a time are best avoided. The Lyngngams of Nongpdhar bury the cremated bones of the deceased within the village, and in front of the house occupied by the deceased when alive, the bones being placed in a hole in the ground, over which is laid a stone, a bamboo tent being pulled over the stone. A bamboo fence three or four feet high is erected round the grave. Other Lyngngams bury the cremated bones and ashes in a gourd in the jungle near the burning-place. On their way home, the relatives of the clan of the deceased who have come from other villages to witness the funeral observation, put up a stone on the path in honour of the deceased, a turban being tied round the top of the stone. The Garos or Dkas, who live at the foot of the Hills on the Kamrup border, and are called by the Assamese *Mara* (spear-men), erect memorial stones in honour of the deceased, the horns (or heads of sacrificial animals and other articles being hung on the stones. The stones are also overlaid in white, and turbans are tied round the tops. The death ceremonies of the Lyngngams, and, indeed, other customs also, are partly Khasi and partly Garo, it being difficult to say that the Lyngngams are more Khasi than Garo, or more Garo than Khasi in this respect; their language, however, has been found by Dr. Stevenson to be a corruption of Khasi. In Nongstoin, Mawlih, and Mawlaw villages, the inhabitants of which profess to be Khasis, the bones and ashes of the deceased are not collected and placed in repositories, as at Cherrapunji. At Mawlaw and Nongstoin a large wooden coffin is used, painted white, with representations on the outside, and standing on four legs. This coffin is not burnt on the funeral pyre. In the family of the chiefs of Cherra, the body of a deceased Siem is subjected to the following process:—It is wrapped in a cloth

the Khasis long afterwards. The bones are buried in the village under a large slab of stone (cf. the Khasi stone sarcophagus), and a monolith is erected outside the village to commemorate the deceased.

KHASI MEMORIAL STONES.

Probably one of the first objects which strikes the eye of a visitor to the Khasi Hills is the very large number of monoliths, table-stones, and cromlechs that are to be met with almost everywhere in that country. Yule, Dalton, and other writers have incidentally referred to them, but, as far as is known at present, no attempt has been made to explain in any detail what is the peculiar significance of these objects to the Khasis. These stones are rightly styled memorial stones; *kynmaw*, literally "to mark with a stone," is the word in the Khasi language for "to remember." The memorial stone, in the ordinary sense of the word, is a memorial to the dead; but we have such names of places in these hills as *Mawlai*, the salt stone (the eating of salt off the blade of a sword being one of the Khasi forms of oath), *Wyanai*, the oath stone, *Mawphlang*, the gravy stone, and others. To commemorate with a stone an important event has been a constant custom amongst many people in many places, and the erection of grave-stones, to mark the spot where the remains of the dead are buried, is an almost universal practice amongst the Western nations, as indeed amongst some of the Eastern also. But the Khasi monoliths are no more grave-stones, in the sense of marking the place where the remains of the dead lie, than some of the memorials of Westminster Abbey and other fanes; the Khasi stones are cenotaphs, the remains of the dead being carefully preserved in stone sepulchres, which are often some distance apart from the memorial stones. It is proposed to treat this subject under the following heading:—

(1) A general description of the memorial stones in the Khasi Hills, showing that they are very similar in shape to monoliths, table-stones, or cromlechs in other parts of the world and of India.

(2) A comparison between Khasi memorial stones and those of the Ho-Mundas, the stones near Belgaum, those of

I. Gurdon E-i, 5 (no date) 1907 AR? Khasi AR?

the Mikir, the monoliths at Willong in the Manipur Hills, and the Dimapur monoliths.

(3) The meaning of the stones.

(4) The method of their erection.

With regard to the first heading, the stones may be divided into (a) menhirs, or vertical stones; (b) table-stones, or dolmens, and (c) stone cromlechs, or cairns, which serve the purpose of sarcophagi. Taking the different stones in order, the menhirs are large upright stones varying in height from 2 or 3 ft. to 12 or 14 ft., but in exceptional instances rising to a more considerable elevation, the great monolith at Nartiang, in the Jaintia Hills, being 27 ft. high, and 2½ ft. thick. A photograph of this stone has been included. These menhirs are erected all in one line which nearly always consists of an uneven number of stones. Three is the commonest number of menhirs, but five together are frequently to be found, and there are some instances of seven stones; at Laitkor nine stones are standing, an illustration of which [24] will be found in this book. The stones are of hard gneiss granite, or sandstone, to be met with in many places in these hills. They are rough hewn, and generally taper gradually to their tops, which are sometimes neatly rounded off. The tallest stone is usually in the middle, and is occasionally ornamented with a small stone, through the middle of which a hole has been drilled so that it may fit on the top of the other. At Nongkrem there is a centre stone with a regularly carved top, evidently intended to represent the head of a man. At Umiew, some two miles from Cherrapunji by the cart road, stand two rows of fine monoliths, each row five in number, and standing on either side of the old bridle road. All of these stones except one were thrown down by the earthquake shock of June, 1897. The centre stone, or menhir, of one of these rows was surmounted by a carved stone covering shaped like a hat, but having a rim with indented edges, the intention being evidently to represent a crown. This stone crown was riveted to the top of the large centre stone. All the stones, including the menhyrthei, or dolmen, have been very neatly hewn. They appear to be of granite. Stones with top coverings or carved heads are however rare.

[illegible] E-4, 1 (no date) P907 AR7 Khasi AR7

211
7.4

In front of the line of monoliths is a large flat table-stone resting on stone supports, the top of the uppermost plane being some 2 to 2½ ft. from the ground; this flat stone is sometimes as much as a foot or more thick. The largest table-stones are to be seen at Nartiang in the Jaintia Hills, and Laitlyngkot in the Khasi Hills. The Laitlyngkot stone measures 19½ by 12½ ft., and that at Nartiang 16½ by 14½ ft. The Laitlyngkot stone is 1 ft. 8 in. thick. Sometimes two table-stones are found parallel to one another. The table-stones are always placed towards the centre of the group, generally in front of the great central monolith. These groups of stones are usually situated alongside roads, or close to well-known lines of route, where they usually attract the attention of passers-by. They do not necessarily face in any particular direction, but are to be found fronting all points of the compass. There is nothing therefore to show that they were erected so as to face the direction of the sun-rise, or of any particular planets. We will now pass on to the numerous stone cromlechs which are to be found, frequently in proximity to the monoliths and table-stones. These stone cromlechs contain the bones of the dead, and the monoliths and table-stones are intimately connected with them, inasmuch as memorial stones to deceased ancestors are erected when the ceremony of depositing bones in the cromlechs has been completed. The cromlechs are built of blocks of stone, sometimes on stone platforms, and sometimes resting on the ground. They are frequently of considerable size. The cromlech is opened by removing one of the heavy stone slabs in front. There are no windows such as are to be seen in some of the illustrations of dolmens or cromlechs in France and Germany in Waring's book of "Stone Monuments, Tumuli, and Ornaments of Remote Ages," probably because the Khasis also wish to confine the spirits and not allow them to escape from the tomb and haunt the living. The cromlechs are generally square or oblong, but are sometimes circular in shape also. Let us now compare the Khasi monoliths with some to be found in other parts of the world. In Lord Avebury's "Prehistoric Times," Fergusson's work, and Waring's collection of plates of stone monuments there are numerous illustrations of monoliths and dolmens

1: Garden E-4, 5 (no date) 1907 AR7 Khasi AR7

be to be found in other parts of the world, which may be said to resemble those of the Khasis in appearance; but this is by no means a matter for surprise, for, given like conditions, amongst primitive peoples, totally unconnected with one another as regards race, and living in countries far remote from one another, the results, i.e. the erection of stones as memorials of important persons, or events, are probably the same all the world over. Waring in his book gives an illustration of several lines of stone monuments with two table-stones, either in front or in rear according to the position of the photographer or draftsman in taking the picture, which would appear to be very similar to the lines of monoliths we find in the Khasi Hills. In plate XLII., fig. 6, of Waring's book, are the lines of stones to which I refer. They may be said to be almost exactly similar to the lines of Khasi memorial stones, except that the stones depicted by Waring have circles or ovals painted on them, which are said to signify that certain sacrifices of animals have been performed. Now the Khasis perform such sacrifices, but they do not mark their performance thereon on the stones. Ferguson on page 447 of his "Rude Stone Monuments" apparently refers to these stones, which are near Belgaum in the Bombay Presidency, and he is of opinion that "they were dedicated or vowed to the spirits of deceased ancestors"; further it is stated that these stones are always in uneven number, a striking point of similarity to the Khasi stones. We know, for a fact, that the Khasi memorial stones were dedicated to the same objects as those of the Belgaum stones, i.e. to the worship of ancestors; so that we have not only similarity in appearance, in construction, and invariable uneveness of number, but identity of purpose, if Ferguson's conclusion is correct. It is, however, a far cry from Shillong to Belgaum, and it may, perhaps, be thought more reasonable if we look for stones nearer at hand. Bradley Birt in his interesting book on Chota Nagpur has given a photograph of certain Ho memorial stones, which would appear to resemble greatly the Khasi monoliths, and if his photograph is carefully examined, it will be seen that there are in rear of the stones what would seem to be stone urns, very similar in appearance to the Khasi ossuaries. The funeral ceremonies of the Hos as described by Bradley

1:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

But, viz. the cremation of the body, the collection of the ashes, their consignment to a grave, and the offering of food to the spirit of the deceased, are similar to those of the Khasis. Although not wishing to lay too much stress on what may be merely a coincidence, I think that the above similarity in death customs is well worth considering with regard to the view, based on linguistic affinity, that the Khasis and the Ho-Munduas were originally descended from a common stock, i.e. the Mon-Khmer or Mon-Annam family, as has been postulated by Logan.

But there are other tribes in Assam which erect memorial stones, e.g. the Mikirs and certain Naga tribes. The Mikirs erect memorial stones in a line, the taller stone being sometimes in the centre, as in the case of the Khasi memorial stones. Such stones are set up by the Mikirs only in memory of important personages, such as *moondaw* or leading *poondaw* (village headmen). Besides the standing stones (*long-chong*), a flat stone (*long-pol*) is also erected in honour of the deceased. I understand that the Mikir stones, like the Khasi, are mere cenotaphs, the ashes of deceased Mikirs being left at the burning places which are generally by the sides of rivers, and the memorial stones not being necessarily anywhere near the burning grounds. Unlike the Khasis, the Mikirs do not collect and carefully keep the bones in stone cairns. Before erecting memorial stones, they dig a small tank; cf. the Khasi custom of digging similar tanks (*um-lei*), before erecting memorial stones (*mawsmaw*), to those of the clan who have died unnatural deaths. As with the Khasis, feasts and entertainments are given when the stones of the Mikirs are erected; but they need not necessarily consist of uneven numbers, it appears. It is possible that the Mikirs may have obtained the custom of erecting memorial stones from their near neighbours, the Khasis.

There there is the interesting collection of stones at Willong in the Manipur Naga Hills, for a description of which I am indebted to the kindness of Colonel Maxwell, the late Political Agent and Superintendent of the State. It is said that about 300 or 400 years ago these stones were erected by the rich men of the village as memorials (probably to deceased ancestors). It is the custom of the Willong village that any person who

Ii Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

wishes to erect such a stone should, with the members of his family, abstain from food; but liquor and ginger are allowed to them. Having chosen what he thinks is a suitable stone, the Naga cuts off a flake of it, returns home, and sleeps on it with a view to dreaming of the stone. If his dreams are favourable, he brings it in, otherwise not. From the day of the selection of the stone, until it is brought in and erected, he must fast. Women are taboo to him for the space of one year from the date of its erection. The custom of erecting memorial stones is not therefore peculiar to the Khasis amongst the hill tribes in Assam. An incidental reference should, I think, be made to the interesting carved monoliths at Dimapur, regarding the meaning of which there has been so much doubt. These Dimapur stones are remarkably similar in shape to the carved wooden *hima* posts of the Garos, another hill tribe speaking a language which is undoubtedly connected with the great Bodo group of languages in North Eastern India. The Garo *hima* posts, like the Khasi stones, are erected to commemorate deceased ancestors. Some of the other Naga tribes, besides the Willong Nagas, are in the habit of erecting what are called peace stones, a description of which will, we hope, be given in a subsequent Naga monograph. The object of the erection of such stones is certainly to show reverence to the memories of deceased ancestors amongst the Khasis, and Garos, and not improbably among the Nagas also.

It is only with the very greatest difficulty that it has been possible to obtain any intelligible information regarding the Khasi monoliths. Whether through feelings of delicacy in revealing the secrets of their religious system to a foreigner, or through ignorance or apathy (there being but few Khasis nowadays who observe the ancient ritual), it has been no easy task to extract information from people about these stones. As far as my information goes at present, I am inclined to classify the stones as follows:—

(a) *Mawlynti*, or *mawkjat*, the stones which are erected to serve as seats for the spirits of departed clansfolk on their way to the tomb of the clan, i.e. when their remains are carried by their relatives to the clan cromlech (see the section entitled "The Disposal of the Dead").

MEMORIAL STONES AT LAITHOR.

(From a photograph by Mrs. Murrell.)

1:Garden E-4, 5 (so date) 1907 AR7 Khasi AR7

(3) *Mawbynna*, or *mawkam*, which are stones erected to commemorate a parent or some other near relation.

(4) *Maw-ramkai*, which are put up to mark the position of tanks or *ramkai*, the water of which is supposed to cleanse the robes and bones of those who have died unnatural deaths.

(5) *Maw-shongthiai*, or flat table-stones, often accompanied by vertical stones, which are placed in the market-places and by the side of roads to serve as seats for weary travellers. Taking the above main divisions *mawlum*, *mawlyndi*, or *mawkjet*, may be described as follows. These generally consist of three upright stones, the tallest being in the centre, and a flat table-stone being placed in front. There are, however, some cases which count more than these upright stones, as *ithmlyndi*, or *mawkjet*. In already stated, the *shnoitik* used to count these stones, *mawlyndi* (the stone of the way), or *mawkjet* (the stone of the leg) at each place at which they halted for the night on their way to deposit the bones of their deceased maternal relations in the *iha synthiar*, or *mawtnak*. The stones are called *mawkjet*, or stones of the leg, because it is supposed that the spirits of the departed sit and rest their limbs on the flat table-stones. The upright stones are not as a rule more than 2 or 4 ft. high, and are not massive like the great *mawbynna*, or memorial stones. They are to be found in great numbers all along the roads or paths which lead to the *iha synthiar*. These stones, unlike the *mawbynna*, have no names.

(6) *Mawbynna*, or *mawkam*, are erected to commemorate deceased parents or deceased ancestors, and consist of 3, 5, 7, 9, or even, in an exceptional case, 11, upright stones with flat table-stones in front. The upright stones are called *maw-shyurang*, or male stones, and the flat table-stones *maw-ky-thei*, or female stones. Turning to the plate of the Laitkor stones, it will be observed that there are nine upright stones, and one large flat table-stone in front. Counting from right to left, stone No. 5 is called *u maw kai*, or the maternal uncle's stone, and the stones to the right and left of it, *ki maw pyrsa ki para*, i.e. the stones of the maternal brothers and nephews. The table-stone is called *ka lawbei tynrai*, or *ka lawbei tymmen*, literally the grandmother of the root, or the old grandmother, in contradistinction to *ka*

In Gordon E-4, 5 (no date) 1907 ART Khasi ART

Soohei khynroo, or *ka Soohei kpah* (the grandmother of the family, or branch of the family). It frequently happens that there are two flat table-stones in front of the upright stones, the one on the left being *ka Soohei kynroo*, or the first ancestress, and the one on the right *ka Soohei kmaphah*, the grandmother of the branch of the clan to which the memorialists belong, or *ka Soohei khynroo*, the young grandmother, i.e. the grandmother of the actual family to which the memorialists belong. In olden days it used to be the custom for the clan-people to place offerings of food on the flat table-stones for the shades of the departed ancestors, and this is sometimes the case still; but now it is more frequently the custom to make these offerings in the *kingsong*, or clan puja-house. The flat table-stones are some 2 to 2½ ft. from the ground, and it is difficult to resist the impression that they were originally sacrificial stones, i.e. that animals or even human beings were actually sacrificed upon them. In connection with this theory I would refer to the interesting folk-tale about the Kopili river. It is here related that in olden days human victims were sacrificed to the Kopili goddess on the flat table-stone (*mawe-kyathei*) at a place called *Iew Kolk*, close to the Kopili river. A careful search has been made for this stone, with the result that a flat table-stone has been found near the above village, where goats are still annually sacrificed to the Kopili. The *dolui* reports that this is an ancient custom. None can remember, however, having heard that human victims were ever sacrificed there. Yet I do not think it at all unlikely that this is the stone, locally called *Myslop*, which is referred to in the folk-tale. At Jaintiapur and Nartiang, both of which places were the headquarters of the kings of Jaintia, there are very large table-stones. We know for a fact that human sacrifices used to take place at Jaintiapur. Is it possible that human beings were immolated on these table-stones? It would be unsafe to base any conclusion on the solitary folk-tale about the *Iew Kolk* table-stone; but the tale certainly furnishes food for reflection. The Khasis borrowed their religious customs largely from the Synteng inhabitants of Jaintia, and it is possible that they may have obtained the custom of erecting the table-stones from the Syntengs also, and that the stones were originally [illegible] human sacrifices.

THE GREAT MONOLITH AT NARTIANG. [illegible]

(from a photograph by the author.)

1:Gurdon E-4, 5 (no date) 1907 AR? Khasi AR?

and that the latter were originally sold by both of them for sacrificing human victims. Sometimes, immediately on either side of the *mawbuh*, or large central stone, there are two much smaller stones called *mawbiang*, or the stone of the drum, and *mawkait*, the stone of the plantain; the drum being used in all religious ceremonies by the Khasis, and the plantain relating to their custom of feeding young children on plantains. The *mawsiem* must be described separately from the *mawbynna*, because they differ from them in an important particular, i.e. that the former may be erected to commemorate the father, while the latter are set up to perpetuate the memory of the ancestors on the female side of the family. *Mawsiem* consist of three upright stones and one flat table-stone in front. The large central stone is called a *maw Sharlang*, or the stone of the father, and the upright stones on either side are meant to represent the father's brothers or nephews. The flat table-stone is to *Ingkai*, i.e. the grandmother of the father, not the first grandmother of the clan, as is the case of the *mawbynna*.

(c) The *maw ambai* have already been described. They are erected to mark the sites of purificatory tanks, which have been dug so that the remains of deceased persons may be cleansed from the impurities attending an unnatural death, and to counteract the adverse influence upon the clan of *Ka Tyrut*, or the goddess of death. These stones are sometimes called *mawtyrut*.

(d) *Maw-shnghiah*, or stones upon which weary travellers rest, are to be found alongside all the principal lines of communication in the district. It may serve as an example of these stones to describe the very interesting collection of stones at Nartiang *hât*, or market. A reference is invited to the plate which gives a representation of some of the Nartiang stones. The great height of the upright stone will at once be seen; it is 27 ft. in height and 2½ ft. thick. This stone is the largest erect stone in the Khasi and Jaintia Hills at the present day, and is a very fine specimen. The upright stones and the flat table-stones at Nartiang are called "*ki maw jong Siem*." There is no separate designation for each of them. These stones are popularly supposed to have been erected long ago by two men,

Sr Gordon E-6, 9 (no date) 1907 ART Khasi ART

U Leh Lankor and U Mar Phalyngki, to commemorate the establishment of Nartiang market, which is called Iew Maw-long. "Lankor" is the Synteng equivalent of the Khasi *kyngkor*, or prime minister. "Mar" is a Synteng word meaning a giant, the idea amongst the people being that in the olden days there were giants in the land who performed marvellous feats of strength, e.g. the erection of the megalithic remains at Nartiang and elsewhere. A puja is performed upon a great flat stone by the *doloi* and his officers in honour of the founders of the market, but no animals are sacrificed, rice and *ryoi* (balls of rice) only being offered. In the days of the Jaintia kings only the Raja could sit upon the great flat stone; hence the name *mawjing Siem* (or Siem's stone). The great upright stone is said to have been brought by U Leh Lankor and a great number of people from Sutiang, a place near Nartiang. With reference to the Nartiang stones I would refer to my theory, formulated above, that they were originally connected with human sacrifices. It may be mentioned that at Nartiang there is a bridge constructed out of a single stone, which is also said to have been set in position by U Leh Lankor. Near Sohtinga there is a group of stones, said to have been originally thirty in number, together with *mawshaphlang*, or stones to seat the weary, which were erected to the memory of a woman, Ka Kumpatwat, who in generations past is alleged to have had no less than thirty husbands. The lady is not supposed to have been polyandrous, nor nine-lived, but to have divorced one husband after another. As she probably established a record for divorce, her descendants afterwards commemorated her in the manner described. There is another very large stone at Nongkseh, which unfortunately fell to the ground in the great earthquake shock of 1897. This stone must have stood over 20 ft. above the ground. It is called *u mawbni Siem*, the stone of the Siem's maternal uncle, and it used to form the central stone, or *mawbni*, of a line of stones. These stones belong to the clan of the house of Nongkseh, which furnishes the *wakhai*, or head sacrificer, of the Siems of Khyrim. The stones at Mawmai, which in ancient days used to be the headquarters of a Siem, are some of the best carved in the hills. At Mawrongjong, in the Jaintia sub-division, is a stone upon

1:Garden E-4, 5 (no date) 1907 ART Khasi ART

which a figure, evidently of a Hindu god has been carved, without doubt after the erection of the stone. Here we have a striking parallel case to the painted and carved monolith near Tregastel in Brittany, upon which has been carved the representation of a crucifix. There are also some carved stones near Nartiang (said to represent two women) called *nongthombor bricn*.

The Khasis say that these great stones were brought sometimes from considerable distances. After being hewn, the stones were laid on a large, wooden trolley and dragged across country by means of ropes of cane, of which plenty can be had from the Wild country on the southern side of the district, and then placed in position by means of ropes and levers. It seems little short of marvellous that these stones, which sometimes weighed many tons, were placed in position by such primitive means, especially when we consider the great trouble there was to remove one of the fallen stones at Nongbaqip lately. Nowadays only comparatively small stones are erected, which are generally hewn and erected on the spot, so that there is no necessity for any conveyance.

In conclusion, it may be remarked that the subject of the Khasi monoliths is in reality a large one, on which a great deal could be written, but owing to considerations of space it has been found necessary to compress the account within its present limits.

FESTIVITIES, SOCIETIES AND TRIBES.

Dancing forms the principal part of all the Khasi festivities, and is an important adjunct of some of their religious ceremonies. One of the greatest festivals in the Khasi Hills is the Nongkrem dance; it may be said to be as important an event to the Khasis as the *Eid ul-Fitr* festivities are to the Muhammadans.

The Nongkrem dance is really part of what is known as the *pomblang* or goat-killing ceremony, performed by the Siem of Kyrim (or Nongkrem) with the aid of his *sob-dei* (high priest) and the various *lyngdoh* (or priests) to Ka Blei Synshar (the ruling goddess), that the crops may prosper and that there may

Ir Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

wonderful mass of granite known by the name of the Kylleng Rock will be found in the section of the monograph which deals with geographical distribution. I have also added a photograph of the rock. The Syntengs have a story that when the strong east wind blows in the spring this is due to the advent of U *Kylleng*, who comes to visit his wife, the river *Umngot*, at that season: amongst the Khasis hills are all of them masculine, but to rivers is usually attributed the feminine gender. U Synger is another isolated rocky eminence rising from the Mawsynram plain close to the village of K'mawsun. The best view of the hill is obtainable from Laitmawsiang on the path to Mawsynram. The village of Mawsmai every traveller from Therria to Cherrapunji knows. It is chiefly remarkable for a fairly large limestone cave, and its fine monolithic stones. The Khasi theory to explain how the moon got its spots is, I believe, original, but is no more extraordinary than our own nursery tale about the "man in the moon." The *Sohpet Byrung* hill is the first hill of any size that the traveller sees on the Gauhati road when journeying to Shillong. It is close to Umsning Dak Bungalow. There are caves in the hill which are tenanted by bears. Strange to say, according to Khasi ideas, this is one of the highest points in the hills; in reality *Sohpet Byrung* is some 2,000 ft. lower than the Shillong Peak. As mentioned elsewhere, the Khasis are very fond of dogs; so I have given their version of how the dog came to live with man. The well-known *Mawsmai* superstition will be found fully described under the heading of "Human sacrifices." I have, however, thought the tale of sufficient interest to reproduce at length here. The story of the river Repetylli is a pretty tale, and is just such a one as would appeal to the imagination of mountaineers like the Khasis. The Kopili story is important, in that it indicates the origin of human sacrifices in the Jaintia Hills; it also throws, perhaps, some light on the question of the use to which the flat table memorial stones were put in years gone by. The superstition about the crossing of the Kopili can be vouched for by many who have taken the journey from the Jaintia Hills to North Cachar by the Kopili route. Mawpunkyrtiang is a small village close to Cherrapunji. The weird tale about the Siem of Malyniang is the pride of the Maskut people, for in olden days their King,

It Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

or difference. It is owing to these three different names being used for the same people that there has been so much confusion about Lyungams previously; e.g. at one census they were named *Synrepem*, at another they received the appellation of Garo, and at a third enumeration they were called Khasis. In Section I. the habitat of the Lyungams has been roughly defined. It is impossible to define the Lyungam country exactly, because these people are continually shifting their village sites owing to the exigencies of *jhum* cultivation, which has been described in Section II. Some of the Lyungams preserve a tradition that they originally came from the Kamrup plains. It is interesting that a people, like the Garos in so many respects, should have the same idea as the Garos as to the hills on the south bank of the Brahmaputra not always having been their abode. The Garo legend is that they dwelt for some years in the Goalpara and Kamrup plains after they descended from Thibet, and before they moved to the Garo Hills; and there is unmistakable evidence of their occupation of both districts in the shape of certain Garo villages on both banks of the Brahmaputra for some little distance up the river. If, as I suspect, the Lyungams are an offshoot of the Garos, it is, perhaps, possible that they entered the Khasi Hills much in the same way as the Garos entered the hill district to which they have given their name. The Lyungams are much darker than the Khasis, and possess the Thibeto-Burman type of feature often to a marked degree. It is not extraordinary that they should have adopted some of the Khasi customs, for the Khasis, being the stronger people, would in course of time be bound to influence them in this respect. That the Lyungams observe the matriarchate and erect (some clans) memorial stones is not peculiar, because the Garos, like the Khasis, are also a matriarchal people (to a limited degree), and the custom of erecting memorial stones is not confined to the Khasis, for other hill tribes in Assam observe the practice, e.g. certain Naga tribes and the Mikirs; and the Garos themselves put up carved posts, called *bima*, in honour of the departed. Although there is not much intermarriage between the Khasis and the Lyungams nowadays, perhaps in days gone by there was a mixture of blood, the result being the hybrid race we are now

doll is made of bamboo and this is supposed to represent either the great grandmother (the Jaubei of the sib) or the great great uncle (euidnia). They walk to the mawsian mawrukos (the ceremonial stones, ancestral stones) (36)

36. Gordon, The Khasis, p. 143, gives another description of these customs. He says: In Cherrapunji two dolls are made, called ka puron and u tyngshop. The former is supposed to represent the Jaubei, the latter the euidnia. The dancers hold these dolls in their hands.

[24] with this ancestral doll (u tyngshop). While some dance, others set up "resting stones" or "foot stones" or "road stones" (maw kjat or maw lynti) on the way to the maw bah for the spirits of the dead, where they can rest on the way to the common grave. These stones are about a meter high and stand three in a row at each place. In front of these a flat stone like a platter is placed on four small stones which form a base or feet (maw kjat, i.e., stone foot). (37)

37. Cf. Table III, Picture 3: "Foot stone or road stone" among the Khasi.

On the day on which the dance ends they arrange ka pyngrei, i.e., a marriage feast of the spirits of the deceased, who died in their youth (grown but unmarried or childless). For this they choose two poor old people a man and a woman, of small size whom they pay for this.

Table III

[illegible] Gathering the Remains and the Ashes Ceremonial Dance. Foot Stone and Head Stone.

[382] [796] One month before the coronation one liquor is poured into a hollowed-
out gourd bottle in the house of the S'iem Sd and offered before the
oldest Blei as a 'nam' (sacrifice of drink). This is done in order to in-
[361] [774] form the u Siohlia long S'iem (the spirit of the first great uncle on
the maternal side who was the first king), the ka Blei long S'iem (the
divinity who makes kings kings) and the u Blei Shillong (the god Shil-
long), that preparations are now being made for the Puja and that
they might help with them.

[776] The u Blei Shillong plays the chief part in the whole ceremony.
He enjoys great reverence among the Khasi, especially in the king-
dom Nongkrem and Syllem. Not far from Nongkrem a mountain
[41] peak rises 6,450 feet above the sea. It is the highest peak in the
Khasi Mountains; its name is "Shillong Peak." Here is the seat of
[77] the god Shillong. The story goes that a man appeared here once,
who said he /[illegible]/ had not been born but came of himself (phu long).
He also told the people that they would receive the kings, S'iem.
So the god who lives here was called u Shu long (he who is out of him-
[65] self), from which the Europeans gradually made the word Shillong
and also gave this name to the splendid mountain station in the heart
of the Khasi Mountains.

[796] [382] After the S'iem Sd has determined exactly the day of the cere-
monies, the news of this is sent out two weeks prior to the ceremony
to the village elders (Rangkah dong). This is done on the day of
the large market (iñ duh), which takes place every eight day. Two
weeks after is the pen-dong, also on the day of the large market,
which is discussed below.

The way in which the invitation is issued is interesting. A num-
[34] ber of chains about an ell long are made of bamboo rings. These are
called kynsah. One of these is sent to the oldest man of each village.
Since the Khasi formerly had no script, this bamboo chain always
served as a sign of invitation or summons to the S'iem for ceremonies,
or of danger of war or of court matters and such. The degree of ur-
gency was shown by the form of the links; in the case of great haste
the form was longish and flat, otherwise correspondingly rounder.
The sending of the kynsah to the village elders serves now as a sign
of invitation for the whole village to appear at the ceremonies and
at the same time as a demand to gather together the prescribed sacri-
[651] ficial gifts. Each of the six districts, into which the kingdom Nong-
krem is divided, must furnish a goat; each individual hut must pay a
tax (called pynthok) of one rupee and four annas in addition. Very
poor people only have to pay one anna or even only a half. The
sacrificial gifts, such as rice, various sacrificial animals, fish, brandy

St Gordon G-3 (no date) 1904 AR? Khasi AR?

(2) *U'mid sin*, —*or departed maternal great-uncle.*
(3) *U shaw long*, —*or departed great-grandfather.*

A very striking feature of the Khasi religion is the use of the leaves of the *diengsing* (*Q. lamellata*) or Khasi oak tree. The leaves of this tree are used to cover the sacrificial knife, a sprig of the oak is implanted in the ground before the sacrifices of fowls or goats take place, an oak bough is hung up inside the house along with the jaw-bones and horns of sacrificed animals and the feathers of fowls. A great part of oak is to be found within the areas of the sacred residences of the Siem priestess of Khyrim, the custodian of the religion of the State of that name. Another feature is the use of altars of stone on certain ceremonial occasions, and no Khasi religious ceremony takes place without the use of a small gourd or *blong* from which libation are poured out to the gods. Dancing always accompanies ceremonies of any importance, *e.g.*, funeral ceremonies, the erection of memorial stones, and the great *puja* of the Siems of Nongkrem.

12. *Memorial stones.*—These are without doubt the most prominent feature connected with these people. The first thing that strikes any visitor to the Khasi and Jaintia Hills is the immense number of these stones. The latter are placed in a line, a higher one in the centre, and lower ones on each side. The centre monolith is ceremonially covered with a round flat stone. The upright stones are always in uneven numbers, being in sets of three, five, seven, or even nine stones. In front of each set of three stones is placed one horizontal stone, or *ronlioh* which rests on three or four small upright stones, the horizontal stone being raised to about one foot from the ground. If five upright stones are erected, two horizontal stones are placed in front of them, and if seven are erected three, and so on. There can be no doubt that these stones possess considerable significance, but what exactly that significance is I am at present engaged in investigating. As far as my information extends at present, I give the following explanation.

Memorial stones may be divided for the present into two classes—

(a) Stones erected by the family, or *kur*, in accordance with the Khasi custom of ancestor worship.

(b) Stones which are erected by children in honour of a deceased parent.

It should be remarked that both classes of stones are merely cenotaphs, the mausoleums of the ancestors or the parents often being nowhere near the places where the memorial stones are erected. Taking class (a) first: Supposing that five upright stones are erected and two horizontal stones as depicted in plate III.$\frac{2}{1}$

$\frac{2}{1}$ [see end plate 1 - - - - Analysis]

St Gordon G-3 (no date) 1904 AR? Khasi AR?

Stone No. 2 , the middle is called *U Mow Kei*, i.e., the stone of the maternal uncle, Nos. 3 and 4 are called *Ki pyrsa*, *Ki pura*, i.e., the brothers or sisters, and the nephews or nieces. No. 5 is called *U Mow Kiang*, i.e., the stone of the *Jirem*, and No. 5 *U Mow Ioit*, the stone of the plantain. No. 6 is called *Ka Iaobei tyrsai*. The word *tyrsai* meaning root, *Ka Iaobei tyrsai* signifies the first maternal grandmother of the family. The above is the system of naming stones in Mawbai Raj—other systems will be described in the monograph.

Class (b).—Stones of th . class are generally, I am informed, three in number, consisting of three upright stones as shown in plate IV and a flat stone in front, as in this case of stones falling under class (a).

Here there is a marked difference in that the big stone in the middle is called *U Mow thaolong*, or the stone of the grandfather or father. Nos. 2 and 3 are the brothers or the male cousins of the father, and No. 4 is erected in honour of *Ka Iaobei*, or the grandmother of the father,—not the first ancestress of the clan, as in the case in stones falling under class (a). The post split at its top containing the jawbone of a bullock which has been sacrificed in honour of the deceased parent should be observed, *vide Fig. B*. It was formerly the custom and is still in some places the custom, to spread offerings upon the flat stones to appease the spirits of the deceased ancestors. These stones, which are only 2 to 3 feet from the ground, suggest the idea of sacrificial tables at some time or other. Stones 2, 4, and 5 in Fig. A are between 9 and 10 feet high, but there are several larger monoliths in these hills.

The description of the stones in figures A and B was given me by a man of some intelligence at Nongkrem, but many different explanations of the names, and regarding the significance of these stones, are given by other persons living in various parts of the hills, and it is not unlikely that the account I have tentatively advanced may have to be modified subsequently. The system of each clan, apparently, varies to some extent from the other, and in some cases to a very considerable degree. In the Jaintia Hills very large groups of stones are found near villages, which are thought by the Syntengs to have been merely erected by the sides of roads as *Mow-siang-thait*, or seats for weary travellers, or for persons attending markets. At one place in the Jaintia Hills memorial stones were erected to commemorate a woman, *Ka Kumpatnat*, who in generations past is said to have had thirty husbands. It may, however, be stated that no such polyandrous custom has been found at the present day. The stones are reported to be thirty in number. There are also many stones at a place on the road from Shillong to Jowai said to have been erected to commemorate those who fell in a battle between the Syntengs and one of the Khasi Siems.

St Gordon G-3 (no date) 1904 ABT Khasi ABT

764 As mentioned before, these stones are not gravestones, they are
767 shaped, both the vertical and the horizontal stones, remarkably like
768 the pictures of menhirs and dolmens that appear in Fergusson's work
on rude stone monuments. It is a remarkable fact that Dalton mentions the existence of apparently very similar memorial stones in certain *Ho* and *Munda* villages in Chota Nagpur, and there is a drawing to be found at page 52 of Yule's Embassy to the Court of Ava of a menhirlike which is apparently very like the menhirlike or monolithic to be met with every day in these hills. It is most unfortunate that the
[212] Khasis, owing to their want of a written language in former days, possess no written records of these stones, and that the Khasis of the present day are so very vague in their ideas about them, for I am inclined to believe that the proper elucidation of this question of memorial stones may prove to be the key to the origin of these people. I therefore strongly advise that a very careful search be made for similar stones, such as I have described, in other parts of India. It is possible that the Khasis may have found monoliths erected by some prehistoric race when they arrived in the Khasi Hills, and they may have adopted the custom of erecting memorial stones by the force of example, but the use of such stones seems to fit in with the Khasi system of ancestor worship, and it is remarkable that the shapes of the stones should be so very similar to those which exist in England, Ireland and Brittany, and I believe also in Denmark and Scandinavia. Is the custom of erecting such memorial stones in any way connected with people practising the matriarchate? The whole subject is a deeply interesting one, and I hope that it may be possible to throw some light on it.

797 13. *Tabus.*—The Khasis have an elaborate system of *song*, or tabus. There are very many different kinds of *song*, but some of them are the following:—

Special tabus, at time of pregnancy.—(*a*) It is *song* for a pregnant woman to accompany a funeral procession.

(*b*) It is *song* for a woman in the first stage of pregnancy to finish any sewing which she may have commenced before she became enceinte. There is a similar prohibition regarding the finishing of the plaiting of wicker baskets.

(*c*) It is *song* for the husband of a pregnant woman to thatch the ridge of the roof of a house at such a time.

(*d*) It is *song* under similar circumstances to fix an axe or a *dao* in a handle.

Ordinary tabus.—(i) It is *song* to build a house with stone walls on all four sides.

nounce the hard G; and in all words of Hindustani origin this letter has the sound of K. 101 [191]

They are called by the tribes of Kúkis and Nágis on the west "Káro", the name they themselves have for the whole mass of hill people on their western side, the Gāros, though as we pass towards their confines, we find the names of local clans giving way to this general term which was not known to some of the villagers of West Nongstoin, who call the Gāros "Dēkor."

The Gāro appellation for the Khāsis is "Dikkil" or "Digil"; and it was very interesting to find, after visiting the villages of both, that they mutually fear each other, and consequently border raids never occur. The Gāros owned that they feared the bow and arrow of their neighbour, a weapon they themselves are unacquainted with the use of.

The Khāsis always point to the east as the quarter from which they emigrated, but there is very little, if any, similarity with the languages of the people now occupying the hills on that side. [178] [191]

Before entering further on the subject matter of this paper, I must request my hearers or readers to remember that having no knowledge colloquially of the Khasi language, the information I give was obtained from natives who understood either English or Hindustani well. The greater part of the information was given me by a very intelligent man, a native inspector of schools in the district; thus I hope that all errors that exist may be hereafter corrected by others who have been able to elucidate with greater exactness the meaning of their many different rites and superstitions. 115

Certainly the most striking objects of interest in the Khāsi Hills are the upright stone monuments that are to be seen all over the country; these, set up by the wayside, or in the villages, more frequently cutting the sky on prominent hills, with the large slabs horizontally set before them, at once recall the Druidical remains of our own island, northern France, etc., and lead one to marvel at the similarity of the custom, and to inquire its origin and design. Many who visit those hills take it at once for granted that they are the graves of illustrious men, or, after a vain endeavour to get some information from the coolies about them, let the matter rest, or finally believe that the ashes of the dead, to whose memory the monoliths are erected, are buried under the flat kind of altar or dolmen seen in front. 764 211

It is always a very difficult matter to obtain information from semi-civilised people on such a subject as their religious rites, especially if the inquirer is ignorant of their language. A slight knowledge of Hindustani on the part of the Khāsia villager, renders the attempt still more hopeless, and the information given quite erroneous.

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

764 The tall upright stones are called "Mao bynna", from "mao",
211 a stone; "bynna", to make known, to be informed, literally a monument. They are also known by the term, "Mao shinran", the male stone, while the flat seat-like slab in front is called "Mao Kynthai", the female stone, representative of all life, being in pairs. My informant explained this by saying the monument would be imperfect without the flat stone or its female adjunct.

769 The ashes of the dead are never deposited under the horizon-
764 tal slabs always to be seen in front of the upright sets, the monu-
211 ment having no connection with funeral obsequies whatever. The monument is purely one to perpetuate the memory of a person long deceased, who, as a spirit, has watched over or brought good fortune to a descendant, his family, or clan. Wealth or
[554] renown of the deceased has no connection with the size of the monument, which may be of any dimensions, from stones a foot or two and upward, but depends on the wealth of those who erect such mementos, and on the benefits the deceased has conferred after passing into the world of spirits and demons, for, according to Khāsi belief, the spirits of the dead and demons are the cause of all joy or woe—they give riches or strike with disease and death.

These monuments are not set up facing any particular point of the compass; the front is generally selected, having reference to the site and its surroundings: thus a number set up together on a hill-top will be found facing outwards, those by the wayside facing the road; however, single sets, standing on a hill-top or rising ground, as a rule, face to the southward.

The history connected with the erection of some large slabs near Cherra Poonjee will exemplify this curious custom. One of the clans, "Kūr" in Cherra, is known as the "Nongtariang"; and many years ago died an old lady of the clan, not famous for anything in particular during her lifetime, but whose virtues appear to have been great after her demise, for after this the Nongtariang clan, from being a poor one, rose gradually to considerable wealth; she, when propitiated and called on for aid, never failed her race, and in return, after some sixty years or more, they raised to her memory five well-cut stones, which are to be seen on the west side of the road between Cherra Poonjee and Surarun, the central monolith adorned with a kind of rose cut in relief on the front face, and an ornamental disc on the apex. It would appear that she still remained the guardian spirit of her clan; they continued to prosper, and as a further token to her memory, they added in 1869 five more stones on the other side of the road, and in a line with the first set.

It may very naturally be asked how descendants possible dis-

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

cover what their ancestors are doing for them, and what their views and inclinations may be as regards the amount of aid they may give. To a Khasia there is no difficulty about the matter; when in distress or requiring aid of any kind, seeking omens by the breaking of eggs (which I will hereafter describe) he appeals to and propitiates any one ancestor he may select; only one or two may promise such protection, and these it may so happen have died years ago. The benefit also conferred may be very trivial, and sufficiently acknowledged by the setting up of stones of small size; on the contrary, if great favours are conferred on the wealthy we find large monoliths forming conspicuous landmarks on many a hill-top, scattered over a large area of country, and which are mostly known to the country round by the name of the individuals who have wrought so much good in their after state. 764 769 211 [782]

These stones are never erected in pairs or in even numbers; in counting over a very large series still perfect, I found them invariably in sets of three, five, seven, or, as I have before mentioned in the case of the Nongtariang clan, in two sets, five and five, on opposite sites, to the same individual.* Even numbers are considered unfinished or imperfect. 801 211 764

A reference to the plans given, numbers 1, 2, 3, 4, will show the various arrangements in which the stones are set up, both in a segment of a circle and at right angles to each other, as in fig. 3. The most common form, however, is in line, fig. 4. Fig. 1 consisted of a circular platform raised about two feet, faced with rough stones on the front face. These three examples were observed on the hill of Lailang-kote, where the bazar is held, and I have not seen anywhere else the monoliths so arranged; in other parts of the country they are invariably set up in a straight row.

These monuments are also erected for such a reason as the following:—During the illness of a person, every kind of propitiation and exorcism either by the breaking of eggs, sacrifice of fowls, pigs, etc., and by the examination of the liver and viscera, having been made, and then failing to restore him; the sick man may vow that should he recover, he will erect a set of stones to one of his ancestors, who, it is presumed, on knowing of the intention, will do his best to save him. 764 211 [782] [787]

In setting up these slabs all members of the community are under an obligation to assist on such an occasion, and are not paid for their labour, beyond receiving in the evening a little food or liquor at the dwelling of the family who have sought the aid. The skilled workmen employed on the stone-cutting are, 764 211 476

* Three and five are the most frequent numbers met with, nine very rare I have seen eleven.

1/9 [see end charts 1-4, category 116 -- Analyst]

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

however, regularly paid, as is done when cutting the stones for the funeral platform; while this work is in progress musicians are also entertained, and a continual beating of tom-toms (hand-drums) is kept up while the work is in progress.

That many of these monuments, and by far the larger number, are of great age, may be inferred from the fact that their history is quite lost.

As to their distribution, they are to be found over all the higher part of the range; the finest, certainly, in the central portion and in the vicinity of the larger villages, such as Cherra Poonjee, Juwai, Nurtiang, etc.

In Nongstoin, on the west, they gradually die out, and a few, not exceeding three or four feet in height, are to be found in the Khasia villages towards the Garo tribes, but at this limit the Langams come in, and their customs assimilate more with the former-named people. It is the same on the east and north-east of Jaintia; the stones set up are smaller and of rougher form, and by no means so numerous, yet they are to be seen in all kinds of out-of-the-way places quite overgrown with grass and jungle, where villages have not existed for years. Indications were not wanting, shewing that the country had been formerly much more populous, especially on the northern slopes of the Khasi and Janitia Hills. I have, on the other hand, never come across structures of the kind anywhere beyond the limits of Khasi-speaking people, that is, between longitude 91 deg. and 92 deg. 30 min., which includes the Jaintia Hills, the people of which part are called "Sintengs", differing in some minor points from the Khasis; the dialect is distinct, and there is so strong a type-form of likeness and expression, the two can be generally separated without inquiry. The same remarks hold good for the western side; a Khasi of the border Nongstoin villages can be told off at a glance: so strong are the great clan likenesses.

I have traversed the whole country on the east: viz., the North Cachar Hills, inhabited by tribes of Kookis and Nāgas, and had the Khasi ever occupied permanently a larger area either on the east or west, particularly the former, emigrating, as they are supposed to have done, from that side, I think we might have expected to find, occasionally, remains of their imperishable monuments. The only exception that I know of occurs on the road from Nenglo to Hangrūng, in the North Cachar Hills district, beyond Asālu, a part of the country now in the occupation of Nagas, and formerly entirely in that of Kacharis, who are Bodos or Méchis. The road lies through forest, keeping along the high spur; at about two miles from the peak of Hemeo are to be seen several large slabs of stone nearly level with the ground, one ten feet by six, covering some sort of receptacle, for the ends of the

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

764 stones facing the sides are plainly visible. Near to these slabs
●211 is a platform with sides built up of rough stone, similar to those
171 about Cherra Poonjee. Now Nāgas bury their dead, and no monument is erected, the graves being dug in the village street, often at the very door of the deceased person's house, all the protection and covering being a rough one of bamboo or straight sticks interwoven and neatly pegged down all round with hooked sticks. Some tribes of Kūkis bury, others burn, but I have never observed any stones set up, or used to cover the grave. There is just a possibility that the slabs on the Hemeo ridge are the remains of an old Khāsi settlement, occupied, perhaps, for a short period when on their emigration westward.

The largest collection of huge slabs and upright stones that I have seen anywhere in the Khāsi Hills, is at Lailang-kote, the arrangement is so different in every way, that there can be little doubt that it was erected for a very different purpose, and was probably a place of meeting of the chiefs and elders of the clans. The steps to ascend it would indicate such a purpose, and we can imagine all the men of rank and influence seated around, and harangued by one of their number. I could never learn the history of this structure; although I made frequent inquiries, they could not say when or by whom it was set up. The stones, especially the large horizontal one, are of great size; this, with others, is of the granite found close by, but the hill on which the structure stands is an outlier of quartzitic sandstone, horizontally stratified, and great labour must have been expended in dragging such huge blocks into their present position; for the slope to the top of the rise, though not great, yet is quite sufficient to render such work a formidable undertaking. The weight of the largest horizontal slab was twenty tons eighteen hundredweight, and of all the stones composing its construction eighty tons. The horizontal granite slabs were unhewn, as well as the highest upright monolith, which stood eighteen feet nine inches. Eight of the upright stones out of the eleven were of sandstone. The largest slab is an irregular oval in shape, thirty feet by thirteen feet in longest and shortest axis, with a mean thickness of one foot and one-third, standing nearly five feet and a-half above the ground, and resting on ten upright unhewn pillars of granite; on the south side are four other slabs arranged close to the edge of the large one, and round all rise the eleven upright pillars; on the eastern end are two other slabs forming steps to ascend by.

I give a drawing of this very curious monument with a plan, and in an appendix the measurements of every stone, and these shew better than aught else the great massiveness of the work, and what an amount of labour these people must have expended in collecting the materials and setting them in this spot.

[see end plates 2-4, category 116 - - ~ - Analyst]

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

764 I never saw the Khasis engaged in raising a stone into the
● 211 upright position, but I saw the spars which had formed a sort of
[483] cradle on which the stones forming the monument erected by the Nongtariang clan previously alluded to had been dragged from the spot where they had been quarried. They consisted of strong curved limbs of trees roughly smoothed and rounded, and would present a very small surface to friction. These stones had been taken from the side of a hill near, and had apparently been wedged out of the face of a step in the exposed sand-stone strata.

It may be as well that I should here give some account of the funeral rites of the Khasis, which will show there is no connection between them and the monuments I have been describing, and with which the other stone erections have no doubt been often confounded. In their funeral rites there is much that is wonderfully strange, and to those unacquainted with their
771 superstitions, appears unmeaning. There can be no doubt but
769 the Khasis have a very strong belief in a future state, and to say
778 that they have no religion, as has been stated by some writers, is erroneous. True, they have no temples for either worship or idols, the religion of the people is principally a demon worship, and we find the Khasi ever in communion with or in the power, as he supposes, of the spirits of those who have gone before him. While, added to these spirits of their ancestors are numberless demons, male and female, ever ready, if not propitiated, to bring evil upon himself or his undertakings, and whose power even extends over the spirits of the dead. Every dark shady wood, every stream, every conspicuous hill has its presiding demon, which in many instances gives the name to the site. Thus, the hill of Lārū, in North Jaintia, beyond Nongjinghi, is the abode of a one-legged demon, whom to see is death, but who was occasionally heard in the dense forest that clothed the northern steep face of the mountain, so said the credulous villagers of Nongtūng.

764 The dead are burnt on a funeral pyre, the logs of which are arranged very regularly, and the body lies in a sort of bed formed by them.

The calcined bones and ashes are collected and placed in an earthen vessel (small "ghara"), and are generally buried in some adjacent spot, a stone being placed over the vase for security; they do not, however, remain permanently in this place. Every family or clan has a separate receptacle for these remains, constructed in several ways, but always covered with a heavy slab of stone: these receptacles are called "Mao-bah," the great stone "Mao-shiing," a bone depository—lit., the "bone stone."

M. Schlagintweit has fallen into an error regarding the dolmen-shaped structures, and was not aware that this form is so

health, that we may increase and prosper, that we may walk securely, 782
that we may enjoy our possession in security, that we may carefully ameliorate our families, that we may increase in number. Do thou embrace us, do thou confide in us, do thou support us whilst we observe the rules and customs, that we may become numerous, that we may offer thee sacrifices. Come thou and receive us, receive us at thy feet, that we may spread out on the right and on the left. Come, confide in us; come, support us; come, envelope our spirits with thy power.*

This sacrifice is generally made by a whole Kúr or family *all related* by blood.

Appendix C.

Crawfurd's "Embassy to Siam", p. 19.—"Under ordinary circumstances so much importance is attached to the rite of burning the 764 211
dead, that if the ceremony cannot be performed soon after death, either from poverty, or from the party dying at a distance, the body is first buried, and afterwards, as soon as convenient or practicable, disinterred and consigned to the funeral pile. Of persons of distinction, a few of the bones are kept, and either preserved in urns in the houses of their relations, or buried, with little pyramidal monuments over them, in the ground adjacent to the temples. Of these monuments we saw a good number: they are small and paltry, without any inscription.

Appendix D.

W. Griffith's "Journals", p. 75.—"Close to the village are the 764
burying-places of two Singphos. These have the usual structure of the cemeteries of the tribe, the graves being covered by a high conical thatched roof. I find, from Bayfield, that they first dry their dead, preserving them in odd-shaped coffins until the drying process is completed; they then burn the body, afterwards collecting the ashes, which are finally deposited in the mounds over which the conical sheds are erected," etc., etc.

Appendix E.

Burning the Dead, etc.—"The practice of preserving dead bodies in honey has not arisen, as M. Schlagintweit states, from the extremely wet season experienced at Cherra. Bodies are burnt throughout the rains, as I have witnessed. Men of rank or wealth are treated in the above way, and are often kept thus preserved during the whole of the dry cold weather, and not burnt until a propitious time has been selected. The custom, no doubt, has been derived from its Eastern source."

---

* Mr. Pryse remarks: "However devoid of sense or puerile the traditional and unwritten literature of the Khasis may be considered, the writer is not sure that he is able to elicit much more sense from many parts of the much talked of literature of the Vedas and Puranas of the Hindu sages," and he offers a specimen from the Sanhita.

THE LARGEST FLAT STONE OF GRANITE.

Greatest length, 30ft. 4in.; breadth, 10ft.; and mean thickness, about 1 foot: measured by co-ordinates laid off from a central line, at 2 feet apart, with the thickness at edge. Total of cubic feet in mass 329·0.

FLAT STONES ON SOUTHERN SIDE, AND THE TWO STEPS.

	Mean breadth.	Mean length.	Mean thickness.	Cubic feet.
No. 1=	6ft. 0in. ×	8ft. 4in. ×	8ft. 0in.	=33·0
2=	5ft. 8in. ×	9ft. 8in. ×	1ft. 6in.	=82·0
3=	5ft. 2in. ×	9ft. 9in. ×	1ft. 4in.	=67·0
4=	5ft. 1in ×	7ft. 2in. ×	1ft. 4in	=49·0
5=	9ft. 3in. ×	5ft. 8in. ×	1ft. 0in.	=52·0
6=	3ft. 2in. ×	5ft. 8in. ×	8in.	=12.0
				295·0 cubic feet.

The specific gravity of granite being taken at 2·6, or 163 lbs., the weight of the Lailangkote granite by experiment, we have for the weight of the largest flat stone, 329 cubic feet=tons 23 : 18 : 3 : 7; for the other six, 295 cubic feet=tons 21 : 9 : 1 : 9.

DISCUSSION.

[113]
764
211
114

Dr. CHARNOCK said the "Asiatic Researches" for the year 1828 contained a short paper by a Mr. Walters on the Khāsi (Cāsias). The paper in question, which related to the village of Supar-Punji, also contained drawings of certain stone monuments; among others, four large circular stones standing together. They were only a few feet

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

high, with a smooth surface, and resembled trees cut down; but it did not appear for what purpose they were used. Mr. Walters stated that the uprights and stone doors referred to in the paper were monuments to the memory of deceased rajahs and chiefs; that the upright slabs of granite were detached from the rock by means of fire; and that the dead bodies of the Khāsi are burned at an appointed place, and the ashes placed in earthen pots, which are deposited under the stones. He (Dr. Charnock) doubted the suggested derivation of the name of the tribe. If derived from the Hindústání, it could not be very ancient. The chief interest in the paper lay in the fact that the Khāsi erect these monuments at the present day.

Sir Duncan Gibb said there was a feature of some interest in the author's very interesting paper, and that was the statement that the stones of the megalithic remains described by him were obtained from quarries of sandstone not far distant from the place in which they were erected. Now, this point he looked upon as of considerable importance, because it so readily explained the comparative facility of transport of such huge masses of stone as entered into the construction of the monument described. In this country the most diverse opinions prevailed as to the locality whence the stones were obtained composing such monuments as are found at Stonehenge, Aylesbury, and other places, and he thought the author had added to the value of his paper by giving accurate details as to the locality whence the stone was obtained, composing the remarkable monuments so graphically illustrated; nevertheless, as a geologist, he should like to know from the author to what formation these sandstones belonged.

Col. A. Lane Fox thought the Institute might be congratulated upon the paper which they had just heard, which was one of the most important contributions to anthropology that had been received for some time past. It was impossible to overrate the value of the details of the manners and customs which Major Godwin Austin had given, and which were associated with the erection of these megalithic monuments at the present time. They might at some future time serve as links of evidence in interpreting the object of similar monuments in other times and places. The great problem before the Institute, he thought, was how far the builders of these monuments in our own time might be regarded as the representatives of those who erected them in the prehistoric period of Europe, or how far the monuments themselves might be regarded as survivals from the prehistoric age. The geographical distribution of these monuments, as he had before shown in the *Ethnological Journal*, was continuous, or nearly so, extending from those Kassias in the north-east of India to Central India, Persia, Asia Minor, the Crimea, along the north coast of Africa bordering the Mediterranean. They are found in Etruria, up the south and west coast of France into Britain, and as far as Denmark and Sweden. In so far as our present knowledge enabled us to judge, they were unknown in Russia proper, in Northern Asia, in Central and Southern Africa, and on the two continents of America, with the exception of Peru. Their continuous geographical distribu-

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

764 21 114

tion extending from our own country to the country of these Kassias was in favour of the view that their erection might be a practice handed down by them from the remotest time; and this gave great additional interest to the study of the customs of the people who built them. Evidence of great antiquity of these monuments in India was wanting; most of those examined in Central India have been found to be associated with implements of iron; but it had been shewn that iron in the soil in that country would be preserved for ages, and there was no knowing how far back the use of this metal might have extended. There was one peculiar custom which in Europe, Africa, and Russia appeared to have nearly the same geographical distribution as those monuments, and which was sometimes associated with them; he alluded to the custom of placing pieces of rags upon trees at holy wells and elsewhere as a cure for diseases, and he should like to ask Major Austin whether this custom prevailed amongst these Kassias or in their neighbourhood.

Mr. Hyde Clarke observed that Colonel Fox had just enumerated the geographical region of megalithic monuments, and this was precisely the region described in his paper on the Caucaso-Tibetans. The areas are coincident. The Khasias are seated among tribes, which have linguistic affinities with Georgian and Palæogeorgian. The present Khasias cannot, however, be considered as *in situ* in reference to the ancient migration connected with the stone monuments of the Dekkan, but are a subsequent migration. The connection of traditions between Khasias, etc., and Burmah is simply because they are obtained from a common centre in High Asia. Among the many valuable facts is that of the male and female stones, and the numbers of these are, perhaps, also male and female. The numbers three and seven signify middle. In two cases where eleven occur they are arranged as six and five. The male stones are more numerous than the female, and may have some relation to polyandrous notions. Egg divination may possibly have its metaphysical basis in the relations which exist in many languages in the form of words for eye (eage) and egg. Major Austen's testimony to the moral qualities of the hill tribes is of value. Dr. Hunter, hon. member Anthropological Institute, has pointed out in his *Rural Life in Bengal* that it is on the hill tribes we must greatly rely for the invigoration of our Indian empire.

Mr. W. C. Dendy: The great merit of this paper is that it is written by a careful observer who was an eye-witness of all which he describes; one such narrative is worth a volume of compilations. In our own region the megalith is a relic of very ancient date, the record, perhaps, of a semi-barbarous race, and all account of them is usually speculative and conjectural. In the east we learn there are kistvaens and cromlechs and dolmens of recent date, the constructors of which are yet in existence, and an inquiry into their history may elucidate by analogy some of the obscurity that has yet clouded our own megalithic monuments. Choir Gawr or Stonehenge is composed of several sorts of rock, blue stone and marble, sand and granitic: why is this variety of selection? Among Major Austen's sketches there is

9: Godwin-Austen G-3 (no date) 1872 AR7 Khasi AR7

764
211
114

one of a beautiful megalithic temple, and he alluded to male and female stones. May this variety of quality and colour in the stones be symbolical of idol or astral or planetary worship? In Asia, it seems, these relics are chiefly within a certain latitude forming a belt from Oceania to the Mediterranean, the zone, indeed, of the anthropomorphous simiæ; and we have accounts of the relics of Asiatic pigmies discovered in and around one of these cromlechs not remote from the Khasi Hills. Remembering the influence of climate on both mind and body, it might be interesting to inquire how far a superstitious psychology may be an ethnic trait among the less accomplished orientals.

Dr. A. Campbell, Mr. James Fergusson, Mr. J. W. Flower, Dr. Seemann, Mr. E. B. Tylor, Mr. Wake, and the Chairman, also took part in the discussion.

133 patches of open forest, and with scattered fir trees and oaks. Though south of the Himalaya range the character of the 137 country is more like that found in the Himalayas at 4,000 feet higher elevation, and many plants, never collected in the Himalayas below 9,000 feet above sea-level, are found in the Khasi Hills between 4,500—6,000 feet. In this marvellous plateau the sub-alpine and the sub-tropical forms overlap; at the very foot of elegant palms may be gathered the identical stag's horn moss, which, in Britain, is found only on mountains. On a fir tree much resembling a scraggy Scotch-fir is seen growing the Vanda cœrulea, the king of epiphytic orchids; a gnarled oak will carry a gigantic tropical liane; the painted lady and many other British species of lepidoptera will be accompanied by gorgeous tropical papilios and by window moths eleven inches across the wing; the cuckoo and Himalayan pheasant are above, while the tiger, the wild elephant and the green python are below. Justly has Dr. Hooker observed, "I know no spot in the world more calculated to fascinate the naturalist who, while appreciating the elements of which a landscape is composed, is also keenly alive to the beauty and grandeur of tropical scenery."

211 2. Almost throughout Khasi-land, and in a less degree through the Jaintea country, monumental stones are common. They are numerous in villages in the valleys, but are specially prominent, and sometimes of gigantic size, scattered over the rounded hill-tops where they form a feature in the landscape. In all modern treatises of Archæology and Anthropology the study of monumental stones forms an important chapter. Monuments of a remarkable similarity in design are found alike in Europe, Asia, and isolated islands in the Pacific Ocean, and these are in general of such extreme antiquity that they are treated as belonging to the prehistoric age. The Khasi stone monuments have attracted already much attention; first because of their great number and size; and, secondly and chiefly, because on these hills the erection of these monuments is now in full practice. It is reasonably supposed that a careful study of the Khasi method of raising the stones, and of the traditions or customs in accordance with which they raise them, may throw some light upon more ancient monuments of the same kind, even upon Stonehenge. It has been proposed to send out a commission from England to survey these Khasi stone monuments. They are described by Dr. Hooker, in his work (Min. Journ. II. 276), also by Colonel Raban in the *Calcutta Review*, and some account has been lately given by Major Godwin-Austen in the "Journal of the Anthropological Institute," No. 2, Oct. 1871.[1] The present memoir was written

[1] [This article has been abstracted for the Gile. —Analyst]

years ago, previous to some of these published accounts, but contains several details not given by any of them.

3. The Khasi stones are of three classes, viz :—

a. The funeral pyres.

b. The kists containing the pots of ashes.

c. The monumental groups.

It is the last class (c.) which has, hitherto, nearly monopolised attention, and to which the published notices almost exclusively refer.

4. The Funeral Pyres.—When a rich man dies his body is generally reduced to ashes immediately, but his honorific cremation does not take place till some time, often a year, afterwards. In the interim the earthen jar containing his ashes is kept "under a stone" (in Khasi talk) *i.e.*, in a small temporary closed kist. For the honorific burning a pyre is prepared on which the ashes are burnt over again a very little, *pro forma*, and the great funeral feast follows.

The pyre is placed just outside the village of the deceased, on a hillock or in a clear space and near the road. The modern pyres are usually square (approximately), the sides of stone (dressed or undressed according to the means of the family) about four or five feet high, the whole of the middle filled with loose stones and earth up to the level of the walls.*

A pyre was raised about four years ago just outside the village of Mawmai close by the English main road. Many hundreds of men and women carrying from ½ cwt. to 1½ cwt. on their backs pass close by this pyre daily and a considerable per centage rest a few minutes on it. Ledges are raised on two sides, but are by no means essential to a pyre; they merely add a utility. The Khasis mean the ledges to be a convenient height to rest on with a load, and each ledge satisfies this condition, but no Khasi would dream of measuring with a two-foot rule, so as to get them the same height. So the pyre itself is meant to be a square or thereabouts. All the Khasi stonework is done in this way; they do not care to make it geometrically accurate, and consequently in my opinion little valuable result could be drawn from any accurate measurement and mapping of the stone monuments.

This pyre at the entrance to Mawmai is one of the most complete modern pyres. The ancient pyres were very seldom (if ever) made with hewn stones, and the Khasis state that in former times they were as often made round (*i. e.* oval) as square. Being thus originally very roughly shaped heaps of loose

* For admirable illustrations of the Khasi monuments, see "Proceedings of the Soc. Ant., Scotland," vol. i, p. 94. Fergusson's "Rude Stone Monuments," chap. viii, and "Asiatic Researches," vol. xvii, p. 368. [Ed.]

10:Clarke U-3 (no date)1874 AR7 Khasi AR7

211 764 unhewn stones, and, being used on only one occasion, they rapidly fell into complete decay. Dr. Hooker mentions that he repeatedly remarked cones of earth, clay, and pebbles, about twelve feet high, upon the hills, which appeared to be artificial. These must have been the broken down pyres.

764 5. THE KISTS CONTAINING THE POTS OF ASHES.—These consist of a circle or square of upright stones, fitting as closely as a Khasi can conveniently make them to do, with one round or square flat stone on the top. They vary in size from a few inches diameter to six or seven feet.

The circular kists are more especially used by the people of the valleys, *i. e.*, who inhabit villages at less than 3,000 feet above the sea; at Walong and Sohbar, which stand west and east of the main Government road as it steeply ascends from Sylhet, there are hundreds (I am not sure that there are not thousands) of kists of this type inside the village. The Khasis of the grassy plateau, the true Nongphlang (*i. e.*, people of the grass in Khasi language, the genuine representative type of the tribe) very commonly employ square kists.

One great feature of the Khasi sepulture is that the ashes of the families are collected from time to time. At first the ashes of a man are probably kept in a small kist. Then after a few years a great general family ceremony is held, and the ashes of the various individuals of the family are collected from the smaller kists. The ashes of all the men are collected into one earthen jar, the ashes of all the women are collected into another, and these two jars are placed in one larger kist, the jar

of women's ashes next the door, *i. e.*, the last stone closed; the reason of which is that in Khasi-land the woman is always mistress of the house. The quantity of ashes altogether is very small. 764

Each occasion of collection of family ashes is accompanied by a grand family feast, which is mainly of pig. No bones of pig could by any chance get inside the kist; that would be horror.

The stones forming the kist fit as closely as a Khasi can conveniently make them; a mouse might, however, generally get in. In the neck of each earthen jar of ashes a close-fitting stone is placed so that no animal could get at the ashes within; but this, of course, does not fit by any means air-tight, and the damp of the climate affects the ashes so much that on re-opening the kists after even a few years, for the purpose of agglomerating the family ashes, it frequently happens that no trace of ashes is found in the earthen jars.

In the descriptions of the Khasi stone monuments hitherto published, these numerous kists appear often overlooked or confounded with the horizontal monumental slab. The kists differ entirely in their object and meaning, and in being closed. So long as they contain earthen jars they cannot be mistaken; but by the continual collection of family ashes the majority of the square kists are left with one side broken down and empty, and in such a state it is sometimes impossible to determine whether the horizontal slab be a monument or the lid of an old kist, unless a family can be found to claim it as their monument. Where there are no upright monumental stones near I incline to suppose that a large majority of these doubtful remains are kists and not monuments.

6. THE MONUMENTAL GROUP.—There are two general types of monumental stones, viz., the upright slab and the horizontal slab. 211

The upright slabs are commonly grouped in threes or fives (sometimes they are seven or more); they are nearly always oblong and set up in a row with the tallest stone in the

10:Clarke U-3 (no date)1874 AR7 Khasi AR7

211 middle; annexed is a representation of a common type containing five stones.

A common height for the middle stone of such a monument will be six to ten feet, by 2-3 feet wide. The stones are sunk not very deep, say 1-2 feet, into the earth; great numbers of fallen stones are seen. Monuments of this character are often placed on the crest of the hills, and in many parts of Khasiland the landscape appears dotted over with them.

The horizontal slabs are commonly grouped in pairs. The flat slabs may be 5-10 feet long, and are rarely so exactly quadrangular, and they generally have some of the corners irregularly rounded off, and thus pass into the oval or round horizontal slab, which is also a frequent type.

The upright and horizontal slabs are often combined to form a single monument, and perhaps the commonest of all the combinations is that in which five upright slabs have two horizontal before them. The combinations adopted are, however, endless in variety. In these combinations it must be understood that the whole group of stones forms one indivisible monument, which may be the monument of one individual, a household, or a family. Families retain a history of the monuments which belong to the family, and thus in a small degree of the names of their ancestors. Such family monuments may be repaired, added to, or rebuilt from time to time. They are not necessarily placed where the family ashes are kept in kists, or near such kists; but they are usually at no great distance from the village where the family dwells.

The putting up a large stone, say one that stands fifteen feet out of the ground, is a very costly matter, and the monuments of the first class in size in the Khasi country are not very numerous; in the monuments of small stones, the number of stones is often great, I have noticed twenty-one stones in a row, no stone exceeding two feet high.

The upright slabs are (particularly when unaccompanied by any horizontal slabs) usually placed in a straight line. But frequently, where the horizontal slab is round, the upright slabs stand in the arc of a circle, and sometimes the upright slabs are placed in a curved line apparently by accident, or because the nature of the steep ground suggested such an arrangement. Two such monuments occur on the main road to Lailankote.

Major Godwin-Austen states in his article on the subject that
114 the upright slabs *always* stand in threes, fives, sevens, etc. This
801 is a mistake; to have the number of stones unequal, with the
211 central slab the tallest, is perhaps the plan adopted in forty-nine monuments out of fifty; but among the vast variety of monuments

in these hills a dozen monuments on the binary type may soon be found in which there are two equal upright slabs in the middle, and the other stones placed symmetrically on each side of them.

7. There are three kinds of rock employed by the Khasis for stone monuments, viz.:—

a. The Cherra sandstones.
b. The Shillong sandstones.
c. The granite.

Small stones are conveyed considerable distances from the place of manufacture before they are set up—large stones are not—hence the material of the monuments is determined everywhere geologically.

a. The Cherra sandstones are tertiary and cretaceous rocks spread along the southern edge of the plateau and producing the ledges which mark its abrupt termination. In the great thickness of these sandstones are many beds in which the rock occurs in large sheets with very few joints, and well-adapted for working out large slabs therefrom. The sandstone is generally very hard, but not so hard but that the Khasis can work it with their own native-made iron tools.

There is a quarry, now in full work, about half-a-mile out of the old Cherra cantonment, upon the Mamloo path, where slabs may be seen in preparation. The slabs made from the Cherra sandstones, admitting of being worked, are generally hewn pretty fairly to a shape and smoothed before being set up. The ancient monuments are, however, often made of very rough slabs.

All the well-known monuments near the old Cherra station are made of these sandstones, as also the large monuments at Mamloo, Mausmai, and Lirinow. These three monuments all stand on sheets of Cherra sandstone and the stones were cut out of the rock hard by where they now stand. The stones quarried now outside the Cherra cantonment, being for transport, are none of great size.

The Khasis also work gigantic slabs of stone for bridges. Where the span is anything under twenty feet a single slab four or five feet wide and two feet thick is thrown across; piers of enormous blocks of sandstone are raised on each side, on which the slab may rest, if there is the remotest fear that the water can, in any flood, reach the under surface of the slab. As compared with such a bridge the Khasis regard the best efforts of the English engineers as mere makeshifts. The arch at Amwee figured by Dr. Hooker is Bengali work.

b. The Shillong sandstones extend over a large area of the northern portion of the plateau: they are often more argillaceous

10:Clarke U-3 (no date)1874 AR7 Khasi AR7

135 (sometimes slaty) than the Cherra sandstones, and are geologically ancient, probably being of palæozoic age, but containing no fossils. They are generally inclined at high angles and the beds are full of joints, and do not admit of large slabs being got out of them. I know of no monument of the first class made out of 211 Shillong rocks, but slabs of six feet high are very common. They are generally obtained by splitting out with wooden wedges and are not often finished with iron tools. The monuments on the Shillong sandstone area are therefore of a much rougher character than the Cherra monuments, the stones irregular in shape, and the stones that should correspond in size only corresponding very roughly. It is often very difficult to say whether these monuments are of the regular 3-5-7 stoned type or not, but they all are designed in general accord with the two great types of upright and horizontal slabs.

135 *c.* A large area, perhaps 1,000 square miles, of the Shillong plateau, is covered with scattered blocks of granite, varying in size up to masses as large as cottages: perhaps the Kollong rock itself (figured by Hooker) might be counted as the extreme size

211

135 such blocks here reach. This granite area runs east and west through the centre (or somewhat through the northern half) of the plateau. It is of great width and continuity westward, becomes broken into isolated areas in the centre of the hills, and becomes very narrow in the Jaintea territory, finally dying out

10:Clarke U-3 (no date)1874 AR7 Khasi AR7

316 were all found within 200 yards of where they now stand, as may be inferred from the stray stone at about that distance from Stonehenge and not made use of: the small stones were probably brought a considerable distance from the greensand area in the north of the county.

316 483 8. In the setting up of these monuments the Khasis at the present day use only the simplest and most direct mechanical means. For transporting a big stone wooden rollers are placed beneath it and the stone is then drawn by a large number of men harnessed to it by rattan ropes. To set one of the slabs upright, one end is slipped into a hole dug 1-3 feet in the ground, while the other end is tugged by similar ropes. For putting one stone upon another, as in a horizontal slab monument, it is drawn up a sloping stage of bamboo, but if the slab be of great weight, a slope of earth must be constructed, up which it may be pulled. These are the present Khasi methods, and it is, of course, highly probable that similar resources were employed in ancient times. I add a more particular account of some of the larger monuments.

211 9. The monument on the Government main road, about six miles north of Cherra, not far from the village of Lirinow, stands on sheets of Cherra sandstone, out of which the slabs were cut. The tallest stones were about fifteen feet out of the ground. The five stones on the left-hand side (west) of the road were erected when I first visited the hills. The five stones on the right-hand side were erected about four years ago, the family to whom the monument belongs having determined on such an addition. The two portions form one indivisible monument, and exactly correspond, the stones being accurately worked and rounded. The two top-knots are seen in several other monuments, but must, I think, be held proof always of a very late date for their erection. At the Mausmai [531] monument a large rosette is carved on the face of the middle of the big central upright slab, which is also I presume modern work.

10. The monument at Mamloo village. This is, perhaps, the monument in all the hills which exhibits the largest slabs of Cherra sandstone. It stands on sheets of the same rock and there can be little doubt that the slabs were cut on the spot. It is of the (less usual) binary type.

11. The monuments at Rambrai in the west of Khasi-land. These consist of numerous horizontal and vertical slabs of no great size, the upright slabs being 4-8 feet out of the ground, but remarkable for their arrangement on a long open slope outside the village. The monuments stand all close together, collected as in a churchyard, so that it is not easy to separate

10: Clarke U-3 (no date)1874 AR7 Khasi AR7

out each monument. The upright slabs are placed mainly in ranks, the plane of each slab being parallel to a horizontal line of the sloping ground. The effect of the whole, at a little distance, is exactly that of a ruinous English church-yard. The upright and the flat slabs so exactly correspond to the two types of tombstone which were in almost universal use in England before the rise of modern ritualism, that the correspondence can hardly escape notice. It is improbable that this correspondence can be wholly accidental.

12. The monuments at Laitlankote. These are chiefly made out of a heap of granite blocks which occupy the level top of a small hill, and among them are the largest stones in the Khasai country. Some of the upright slabs are as much as 18 feet out of the ground, and the largest horizontal slab is stated by Colonel Raban, in his account, to be an irregular ellipse; major axis, 32 feet; minor axis, 15 feet; thickness, about 2 feet. It is one block of granite, and, like all the other stones here, is unhewn.

These Laitlankote monuments are collected on the level top of this hill, and (partly, perhaps, from the nature of the ground) they affect, more or less, a circular arrangement—the upright slabs being placed irregularly in arcs of circles on one side of the oval horizontal slabs. The slabs being of unhewn granite are necessarily oval and not quadrangular; but it should be remarked that, in marching from Cherra to Laitlankote, the monuments will be seen to pass quite gradually from the plane to the circular type.

At Laitlankote, the largest horizontal slab is granite: of the

10:Clarke U-3 (no date)1874 AR7 Khasi AR7

211 others, some are granite, some Shillong sandstone. Of the large upright slabs round the largest horizontal slab, half are granite, half (placed without method) are Shillong sandstone. And so with the other monuments on this hill. There is no general plan or system (so far as I can trace) in the arrangement of these monuments, as a whole.

It has been inferred from the gigantic size, circular arrangement, and rude workmanship of these Laitlankote monuments, that they are of extreme antiquity, probably the oldest in the hills. I see no sufficient grounds for such an assumption. The workmanship is no rougher than in other Khasi monuments made of granite and Shillong sandstone: the quasi-circular arrangement may be seen in hundreds of monuments: and as to the size of the stones, that proves to me, chiefly, that the Laitlankote monuments were erected when Laitlankote was a dominant and prosperous village. I do not say that the Laitlankote monuments may not be very old, but I should not be the least surprised if positive proof turned up that they had been erected within the last century.

13. The monuments at Nurtiung, figured by Dr. Hooker, and called by him, the "Nurtiung Stonehenge." Nurtiung is in the Jaintea territory, about ten miles east of the Khasi boundary. Dr. Hooker's picture is on a small scale, and gives little idea of the great extent of the Nurtiung monuments, which stand also more closely packed than I should have supposed from the picture.

This Nurtiung Stonehenge contains the largest stones of any monuments in the Shillong plateau; they are also remarkable for being of hewn granite, and further, they are not scattered about the hill tops, but placed within the sacred grove of the village, in a valley near a lake, so that they stand, mingled with large trees, in a manner which I have seen nowhere else in Khasiland.

One of the worked granite blocks is 27 feet high out of the ground, about 6 feet broad at the base, and 2½ feet thick, and is neatly shaped and dressed. This, I suppose to be the work of Bengali artizans, or of their Jaintea apprentices, possibly. There are other very large worked granite slabs; one now used as a bridge, but, perhaps, originally intended for a monument. The area at Nurtiung, thickly covered with monuments, is not less than an acre, and there are more scattered monuments around. The exciting cause for this Stonehenge is, that at Nurtiung there occurs an outlying cluster of granite blocks. None of the large stones at Nurtiung appear to have been moved many feet. The numerous monuments are all reducible to the two types of upright and horizontal slabs, as indicated in the picture of Dr. Hooker.

Until the English period, say up to 1828, it does not appear that the Hindoos penetrated much into the Khasi hills; but they did into the Jaintea hills, and I imagine that either themselves or their handicrafts reached as far as Nurtiung. There is a typical large monument of upright slabs at Jainteapore, the capital of the Jaintea plains.

14. The notes for the above account of the stone monuments of the Khasi hills were placed in the hands of Colonel McCulloch (late Governor-General's agent at Muneypoor), and I have availed myself of many suggestions which he has kindly given me in the present paper.

Discussion.

Major Godwin-Austen said, one of the most interesting points of Mr. Clarke's paper is the notice of the separation of the ashes of the men and women of a family, at certain intervals, into separate earthen pots. I may mention that the shape of the cysts is never the same in any one part of the Khasi hills; sometimes they are oblong and above ground, and sometimes they stand on a raised platform. On opening one, in a part of the country long since deserted, I found entire bones, calcined, and ornaments; these are now always taken off the body before cremation, but, evidently, in former times, were burnt with the dead. The distance the Khasis sometimes carry the monumental stones is considerable. I know of blocks of granite that have been taken into the sandstone area nearly four miles. The custom of setting up these stones is fast dying out, and some villages have given it up altogether. It is impossible to say what age some of the monoliths may be; all history of most of them is gone, and the present generation can give no account of them. The custom is one of great antiquity, I think, and there is no reason why some of the stones, now standing, may not be many hundred years old.

Mr. A. L. Lewis said, if he, as a visitor, might be allowed to make a few remarks, he would suggest that there was no reason whatever for connecting the monuments of the Khasis with those of Britain. Mr. Clarke had spoken of stones lying round Stonehenge as showing that the stones composing it had been gathered close at hand; but this was not so, as they had been brought from a distance of some miles, and there were no loose stones lying round Stonehenge, except those which had been placed there by design. That design was found running through all the British circles that he had seen; but it was certainly not found in the Khasi monuments. It was, however, found in the circles in southern India, figured by Colonel Forbes Leslie, which differed, therefore, from the Khasi monuments, and resembled those of Britain. He had pointed this out before the British Association as long ago as 1869, in a paper which would be found printed in full in the Journal of Anthropology, 1870, p. 286, and also in subsequent papers read before the Anthropological Society and Institute, and published in the proceedings.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

621 [Jatinga]

[175] This village was founded in 1905 by Khasi immigrants from the Jaintia Hills. At the entrance of the village, a bust of the founder, Lakhanbang Suchiang, [101] stands facing towards the east; it was erected on the occasion of the celebration [211] of their Golden jubilee, in November 1955. Houses are scattered along the [346] ridge of the moutain to the east and to the west; in the centre is the church. [171] All the inhabitants are Christians. Before the Partition this was one of the most modern and prosperous villages in Assam.

Jatinga provides a very interesting instance of the Khasi 'colonial' village. 101 It is surrounded by villages of the Kuki, of the Zemi-Naga, and of the Cacharee, 121 who constitute the main population of the North Cachar Hills, and who are tribes entirely different from the Khasi, in economy, social organization, language 621 and culture. Therefore, Jatinga is like an island of Khasi community. I took this village as one of my fields, because I was particularly interested to discover how far the Khasi matrilineal organization is kept up in a community thus situated, surrounded by patrilineal tribes, and considerably modernized by Christianization and economic prosperity; and I was also interested in the process of formation of a new village, in comparison with Rinsibara and Joshipara in the Garo Hills.

Formation of the Present Population of Jatinga.

The first immigrants to Jatinga.

101 The main population of Jatinga, including the founder, originated in Bataw 166 village in the Jaintia Hills, twelve miles away from Jaintiapur, the capital of the then Jaintia Rajas. This village is situated on the border of the Jaintia 175 Hills and the East Bengal plain, the location being very similar to that of Shella, as are their culture and economy. In the later part of the nineteenth 621 century, some members of Bataw village moved to Borkhala, ten miles from Silchar, one of the biggest villages of the then Cacharee king.

These immigrants who came to Borkhala stayed there about fifteen years before they came to Jatinga. Kloribon, the first daughter of the founder's sister was born there. In November 1905, some Christian Khasi left Borkhala for Jatinga, acting on information gathered from a Welsh Mission at Haflong, that the land of present Jatinga was fertile and fit for their cultivation. They 166 were the first immigrants to Jatinga. The Government record names the following three persons as the first immigrants to Jatinga: Suchiang Lakhanbang, 551 Tariang, and Suchen Munik. In fact, according to the data which I collected 614 at Jatinga, Suchiang Lakhanbang was accompanied by the following persons (the names in brackets indicate the clans):

621 his wife, Misibon (Phanwar),[1]
175 his brother, Pryntah, and Pryntah's wife, Sintu (Rupsi),
his sister, Laptho, and Laptho's husband, Munik (Suchen) with their daughter, Kloribon, and Munik's younger brother, Sain.
his friend, Tariang.

Soon after their settlement, Sain, the brother of Munik, brought his wife Tahin (Suiam) from Jaintia. Misibon brought her younger sister, Diasibon. Tariang who came with Lakhanbang afterwards called his wife, Palong. But having spent some time there, they left eventually for another place, so that

1. Misibon was a native of the Cherrapunjee area of the Khasi Hills (not of Jaintia like the others). She was a school teacher at Cherrapunjee, and later became a teacher at a school near Jaintiapur, where she married Lakhanbang.

FURTHER NOTES *on the* RUDE STONE MONUMENTS *of the* KHASI HILL TRIBES. By Major H. H. GODWIN-AUSTEN, F.R.G.S., F.Z.S., &c., Deputy Superintendent Topographical Survey of India. [With Plates ii. and iii.]

HAVING again visited the Khasi Hills since writing my last paper, I am enabled to give some further details regarding their

18: Godwin-Austen G-3 (ca. 1872) 1875 AR7
Khasi AR7

21 rude stone monuments. At the village of Nougshai, near
[101] Shillong, are to be seen some very striking monoliths; and
[131] although they do not come up quite to the length of those at Nurtiang (noticed by Dr. Hooker in his "Himalayan Journals"), yet they are very worthy of being mentioned. They stand on
[133] the open spur just above the village, and have been worked out of the beds of the Shillong sandstone series, and some of the smaller blocks have been taken from the conglomerate beds, the lowest in the series, and which come in, in the bed of the ravine, to the north of the spur. There are a number of monuments on this site, large and small, arranged both in line and on two sides of a square; the two largest have their central monoliths—height, 24 ft. 3 in.; width, 5 ft. 6 in.; thickness, 8 in.; and height, 23 ft. 2 in.; width, 2 ft. 9 in.; thickness, 1 ft., respectively.

[126] Plate ii., which is taken from a photograph by Mr. William Robert, Assistant Surveyor in the Khasi Hills survey party, gives an excellent idea of the second largest structure, showing the very massive flat-stone, the "Mao Kynthai," in front. This structure consisted of thirteen upright stones, which could not all be brought into the field of the camera; but the six outside stones on the right are shown. Many of the slabs in the
175 adjacent monuments have been overthrown and broken quite
211 recently, perhaps by Sepoys and camp followers from the military station close by. At one time a mountain battery of Eurasian Artillery was quartered there, and I attribute the overthrow of so many of the stones in the neighbourhood to their handiwork, who would look on such amusement as a "great lark." The Sepoy (native of India) is not of a mischievous disposition; the European and half-European (uneducated) is markedly so. Thus the monument with the highest stone is imperfect, and it must, when perfect, have been a very handsome one. This is a sad pity, after the time and labour that must have been expended in its erection.

361 I did not observe any new slabs anywhere in the immediate
712 neighbourhood. Nougshai must formerly have been a large
[21] and powerful village; it stands on a naturally very strong position, and old lines of fortification are to be traced on many sides, especially on the approach from the direction of the Falls of the Umiam. These old lines of defence are on a curious system: a ditch and bank have been carried forward from the main defences from 200 to 300 yards down the ridge of the spurs, thus effectually preventing an enemy working round the hill sides below the villages.

174 This fortified site points to a state of things in these hills
712 when the relations between the large village communities or

□26

I give a sketch of a form of cinerary meriting attention, and not hitherto noticed (Plate iii.). Several of this form may be seen on a low spur near the Bazar of Jeddo at Shillong. The cinerary is above ground, and stands on a slightly raised platform; it consists of four thick stones, about three feet high, set on edge, and capped with a heavy top-stone; and, so far, it resembles the usual form, a figure of which is given in my first paper.* The approach to all these depositories is from the eastward by several low steps, and the whole structure is enclosed on three sides by large flat slabs (in the rough) standing on end—the largest being placed round the cinerary itself, overtopping it by three to four feet, and the remainder, thence diminishing in size, stand on either side of the steps. There are about six such monuments along the ridge of the spur, and I have seen no others similar elsewhere. They have been broken into, and the front stone removed, very probably by camp followers from our regimental bazar, which is close by. There is thus a double probability of their ultimate destruction altogether, should the station be extended in that direction.

Discussion.

000

The President said that the paper of Lieut. de Crespigny, on the Milanows of Borneo, contained a great deal of extremely interesting information, especially in relation to their religious customs; the author, however, attempted to connect the Milanows with the inhabitants of Timor, through the similarity of their religious beliefs. He (the President) did not venture to express any opinion on this point, not having any grounds for forming one. He thought, however, that, as a general rule, evidence of identity of races, derived from the comparison of the religions of savages, must be received with caution, especially in the absence of any information as to physical resemblance. The attention that is devoted to religion arises from the interest that is taken in the subject, rather than from the value of the evidence it affords of connection with other peoples. There must always be a great liability to error in the accounts of the religious customs of savages. Inquiries into the resemblance of the arts of different people, about which there could be no mistake, were, he thought,

of more scientific value; and the vocabularies given by the author in this paper would, no doubt, be found of great use to comparative philologists. He hoped that the Institute would be favoured with some further information on the races of Borneo from Lieut. de Crespigny.

With regard to the paper by Major Godwin-Austen, he (the President) would say his communications were always welcome to the Institute. He wished that a more detailed account had been given of the intrenchment referred to. There appears to have been a great camp-building period in the life of most races, when neighbouring tribes were constantly at war, and each had its stronghold in case of attack. Such camps are conspicuous amongst the antiquities of nearly all parts of the world, and a comparison of the different sytems of defence adopted, when viewed by the knowledge of the art of castrametation which we possess, affords reliable evidence of psychic..l connections. In the early British camps of this country he had never seen any evidence of the use of flanking defence except at the entrances; but the description given by Major Austin of this earthwork appeared to indicate that something of the kind was known to these people.

147 villages, such as Shella, Borpunji, Umniuh, and in Narpuh in
132 the Jaintia Hills.
361

ORIGIN.

173 The origin of the Khasis is a very vexed question. Although it is probable that the Khasis have inhabited their present abode for at any rate a considerable period, there seems to be a fairly general belief amongst them that they originally came from elsewhere. The Rev. H. Roberts, in the introduction to his Khasi Grammar, states that "tradition, such as it is, connects them politically with the Burmese, to whose king they were up to a comparatively recent date rendering homage, by sending him an annual tribute in the shape of an axe, as an emblem merely of submission." Another tradition points out the north as the direction from which they migrated, and Sylhet as the terminus of their wanderings, from which they were ultimately driven back into their present hill fastnesses by a great flood, after a more or less peaceful occupation of that district. It was on the occasion of this great flood, the legend runs, that the Khasi lost the art of writing, the Khasi losing his book whilst he was swimming at the time of this flood, whereas the Bengali
[212] managed to preserve his. Owing to the Khasis having possessed no written character before the advent of the Welsh missionaries, there are no histories as is the case with the Ahoms of the Assam Valley, and therefore no record of their journeys.
114 Mr. Shadwell, the oldest living authority we have on the
173 Khasis, and one who has been in close touch with the people for more than half a century, mentions a tradition amongst them that they originally came into Assam from Burma *viâ* the Patkoi range, having followed the route of one of the Burmese invasions. Mr. Shadwell has heard them mention the name Patkoi as a hill they met with on their journey. All this sort of
144 thing is, however, inexpressibly vague. In the chapter dealing
173 with "Affinities" have been given some reasons for supposing that the Khasis and other tribes of the Mon-Anam family, originally occupied a large portion of the Indian continent. Where the actual cradle of the Mon-Anam race was, is as

5: Gurdon G-3 (no date) 1902 Art Inst Arch

764 As mentioned before, these stones are not gravestones, they are
769 shaped, both the vertical and the horizontal stones, remarkably like
211 the pictures of *menhirs* and *dolmens* that appear in Fergussons's work on rude stone monuments. It is a remarkable fact that Dalton mentions the existence of apparently very similar memorial stones in certain *Ho* and *Munda* villages in Chota Nagpur, and there is a drawing to be found at page 52 of Yule's Embassy to the Court of Ava of a cromlech which is apparently very like the cromlechs or *maukynthei* to be met with every day in these hills. It is most unfortunate that the
[212] Khasis, owing to their want of a written language in former days, possess no written accounts of these stones, and that the Khasis of the present day are so very vague in their ideas about them, for I am inclined to believe that the proper elucidation of this question of memorial stones may prove to be the key to the origin of these people. I therefore strongly advise that a very careful search be made for similar stones, such as I have described, in other parts of India. It is possible that the Khasis may have found monoliths erected by some prehistoric race when they arrived in the Khasi Hills, and they may have adopted the custom of erecting memorial stones by the force of example, but the use of such stones seems to fit in with the Khasi system of ancestor worship, and it is remarkable that the shapes of the stones should be so very similar to those which exist in England, Ireland and Brittany, and I believe also in Denmark and Scandinavia. Is the custom of erecting such memorial stones in any way connected with people practising the matriarchate? The whole subject is a deeply interesting one, and I hope that it may be possible to throw some light on it.

784 13. *Taboo.*—The Khasis have an elaborate system of *seng*, or taboo. There are very many different kinds of *seng*, but some of them are the following :—

Special taboo, at time of pregnancy.—(a) It is *seng* for a pregnant woman to accompany a funeral procession.

(*b*) It is *seng* for a woman in the first stage of pregnancy to finish any sewing which she may have commenced before she became *enceinte*. There is a similar prohibition regarding the finishing of the plaiting of wicker baskets.

(*c*) It is *seng* for the husband of a pregnant woman to thatch the ridge of the roof of a house at such a time.

(*d*) It is *seng* under similar circumstances to fix an axe or a *dao* in a handle.

Ordinary taboos.—(i) It is *seng* to build a house with stone walls on all four sides.

group of matrilineal and Mon-Khmer-speaking people 101
who claim as their ancestral homeland the present- 131
day United Khasi-Jaintia Hills District (within ap- 197
proximately 90° 47′ and 92° 52′ E. and 25° 5′ and
26° 5′ N.). This group includes the Jaintias (also 101
Pnar or Synteng) in the southeast, who differ from 184
the Khasis primarily in their duolocal residence pat- 162
tern and less virulent forms of sorcery. (The Hadem 563
in eastern Jaintia are a Kuki people.) It also includes
the Lyngngams (also spelled Lynngam) in the west, [59]
who practice migratory swidden agriculture and cer- [154]
tain peculiar funerary rites, and are said by Ehren- [24]
fels (1955) to be culturally intermediate between [764]
Khasis and Garos. Finally, it includes Bhois, Wars, [114]
and upland Khasis, which terms are primarily terri-
torial. Bhoi country is the north-central part of the
District, and is culturally complicated by the presence
of Mikirs, Lalungs, and Nepalis. War country spans [428]
the entire southern length of the District, so that
Wars divide into Jaintia Wars and Khasi Wars; of
these, the Khasi Wars have traditionally transmitted
property to sons as well as to daughters. The upland
center of the District is the country of the Khasis
proper, those whose culture provides the most useful
model for interpreting the variations found elsewhere.
[For general reference on all categories of Khasi cul- [113]
ture, cf. Costa 1936 and 1937; also Gurdon 1907,
especially for data on regional variations.] **Geography.** 133
The District is 5,554 square miles of hilly tableland, [131]
intricately dissected by numerous rivers, and marked
by significant ecological variation over very short
distances. The tablelands step gently downward north
from Shillong Peak, which at 6,445 feet is the highest
point in the District, and over about 55 miles ease
into the Brahmaputra valley where this is some 250
feet above sea level. To the south, the land slopes
more steeply downward for about 20 miles, and then
drops abruptly, in cliff and steep-slope formations,
to the Ganges sea-level delta that begins at its
north with Sylhet. The annual southwest mon- 132
soons drop torrential rains around Cherrapunji and
Mawryuram villages (for Cherrapunji, a record 805
inches in 1861), but then, reaching Shillong 33 miles
to the northeast, provide only about 100 inches per
year. Rainfall is again greater in Bhoi, which shares
the Brahmaputra valley climate. Climate is temperate
on the high Shillong plateau, where it seldom freezes
and never snows. To the north, climate becomes sub-
tropical, forest is jungly, and fauna abound. The cli-
mate to the south is also subtropical. [Cf. Hooker [113]
1891: chap. XXIX.] **Linguistic affiliation.** Khasi is 197
one of the major Mon-Khmer languages, related to
Mon, Khmer, Semang-Sakai, Nicobarese, and Pa-
laung-Wa. The major Khasi dialects are Khasi, Jain-
tia, and Lyngngam, to which Grierson adds War.
Further minor variations occur from village to village.
The Khasis had no script until 1842, when the roman [212]
alphabet was successfully applied to the Cherrapunji
dialect of Khasi proper. [Cf. Rabel 1961; Grierson [113]
1903-28: 2; Sareh 1962.]

CHAPTER—X

Summary of main findings

125 10.1. Twenty-eight villages were selected for the purpose of the survey. Out of the 28 villages selected, 10 from Border area and 8 from Project area were selected purposively while the remaining 10 were selected at random from the entire district which is referred hereafter as general area.

166 Migration from big villages was rare but some migration was reported in respect of small villages.

164 Occurrence of Malaria, influenza and dysentery is a regular phenomenon in the area. Medical facilities were not found satisfactory and as much as 78 per cent of the villages have no dispensary within a radius of five miles. In regard to education, the facilities cannot also be said to be satisfactory for more than 60 per cent of the villages have a Lower Primary School. Transport facilities were are satisfactory and as much as 86 per cent of the villages still depend upon primitive mode of transport, namely head load. Combined with unsatisfactory form of transport, is the prevalence of unduly high cost of transport.

162 10.2. The number of the families covered by the survey was 1008 in the Border area, and 84y in the Project area and 184 in the General area. The average size of a village in the respective area is 1004, 809 and 804 families. In the Border and Project areas females out number males being respectively 1096 and 1002 females per 1,000 males as against 940 females per 1,000 males in the general area. Literacy is as high as 34 per cent in the border area and 31 per cent in the Project area but as low as 17 per cent in the general area. In all the areas literacy among females is very low.

162 The working population (earners and earning dependents) is as high as 33 per cent in the Border area, 34 per cent in the Project area and 33 per cent in the general area. While there were no cases of unemployment in the Project and General areas, 12 persons were reported unemployed from border area.

241 10.3. 21 per cent of the families in Border area are wholly agricultural, 38 per cent partly agricultural and 44 per cent independent of agriculture. The corresponding figures for the Project area are 63, 31 and 6 per cent respectively while for the General area they are 98 per cent, 29 per cent, 1 per cent respectively.

Predominantly agricultural families constitute 63, 98 and 80 per cent of the families in Border, Project and General areas respectively.

162 10.4. 31 per cent of the families in Border area, 38 per cent in Project area and 10 per cent in General area were absolutely without any land while 35 per cent, 31 per cent and 24 per cent of the families in the respective areas possessed small holding ranging from 0·01 to 2·50 acres representing 11.34 and 36 per cent of the total holding area in the respective areas. 34 per cent of the families in Border and Project areas and 41 in General area possessed medium sized holding (2 to less than 10 acres)

113

428

sonal) or juxtapositions of roots which have not thereby suffered either abscrescence or abscription—that is to say, they are all, with a few exceptions, reducible to their constituent root words, which are still "current coin," and retain their power as independent vocables. The cases in which abscrescence and "fusion" of roots have taken place are confined to—(1) the noun prefix *jong*, expressing element ideas; (2) the verbal prefixes *kyn*, *kyn*, *kyn*, *syn*, *syn*, *syn*, *kyn*, *kyn*, *kyn*, *kyn*, *syn*, *syn*, expressing connexion, intermixture, and contrariety. The language is found purest at Chunā Punji. The Khāsās have no written character or literature of any kind of their own. Tradition says that all was lost while they were yet western of the plains, whence they were driven by a general catastrophe or deluge to their present fastnesses in the hills. The following works on the language have been published: *Khāsi Grammar*, *Anglo-Khāsi Dictionary*, *Khāsi Primer* (Parts I. and II., with Vocabulary),—all issued by the Calcutta School-Book Society; *Khāsi English Dictionary* (in preparation), and an *Anglo-Khāsi First Book*.

"Common-property Inheritance.—A Khāsiā, whether married or single, if he makes his mother's house his home, is said to be *ramong* for his *kur*, *i.e.* for his mother, or his brothers and sisters, or his mother's relatives. On his death his property goes to his mother, if living; if not, to the grandmother; if she is not living, then to his sisters; should his sisters also be dead, to his sisters' children. Should the deceased have left no sisters, the property goes to the brothers; should he have no brothers or should they be dead, the property descends to his aunts, or to their children if the aunts are not living; should the aunts have left no children, the property descends to the grandmother's or great-grandmother's sisters or children. The property of a female on her death goes to her mother, if the deceased have no children; or if the mother of the deceased is not living, the property goes to the brothers and sisters; if the sisters are dead, then their children become the heirs. If there are no such children, the property devolves as in the case of males. When a man is not living in his mother's house, but in that of his wife, he serves for his wife and children. On his death his property descends to his wife, with the exception of the ornaments and clothing worn by him during his lifetime, which go to the brothers and sisters or other relatives of the deceased. Should the deceased have been a widower, the property goes to his children, and in their absence

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

697 In addition, a total of Rs. 899 (£89, 18s.) was expended on jail buildings. The manufacturing account shows cash receipts amounting to Rs. 60, against an expenditure of Rs. 29, or a net profit of Rs. 31 (£3, 2s).

797 871 648 EDUCATIONAL STATISTICS.—The management of education in the Khási and Jáintiá Hills is entirely in the hands of the Welsh Calvinistic Mission, who first established themselves in the District about the year 1844. Though the Khásiás are naturally dull, and children are taken away from school before they have obtained more than a smattering of instruction, yet the perseverance of the missionaries has been rewarded by most satisfactory results. It is stated, in the Report of the Inspector of Schools for Assam for 1874-75, that 'a much larger proportion of the Khásiás know a little of reading, writing, and arithmetic than is the case, probably, in any other District of either Assam or Bengal.' [562] Female education, owing to the interest taken in this work by the wives of the missionaries, is also in a comparatively advanced condition. The missionary schools are largely subsidized by grants in aid from Government. The teaching is conducted in English and in Khási, the Roman character being used in both cases. [212]

The following paragraphs are compiled from the Education Report for 1874-75, above referred to. In that year the total number of schools open in the District was 73, attended by 1666 pupils. As compared with the area and the population, these figures show one school to every 84·34 square miles, and one pupil to every 85 inhabitants. As compared with the total number of males under ten years of age, the number of boys only attending school (1322) shows one scholar to every 13·1. The total expenditure on education in the same year was Rs. 17,722. 11. 3, or £1772, 5s. 5d.; towards which Government contributed Rs. 10,443. 2, fees and fines produced Rs. 218. 5. 3, while the remainder (Rs. 7051. 4) was expended by the Missionary Society from its own funds. The average cost of educating each pupil was Rs. 10. 10. 4, or £1, 1s. 3½d.

648 797 872 PRIMARY SCHOOLS.—With the exception of the schools at Cherrá Ñinji, Jowái, Shillong, and Sheliá, all the schools in the Hills may properly be classed as primary, though several are returned as middle vernacular schools. On this principle the total number of primary schools is 64, in 45 of which a little English is taught. These 64 schools had 1296 pupils on their rolls at the close of the year 1874-75, and an average daily attendance of 829, comparing

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

disfigured from the practice. Adults will chew as many as four or five betel-nuts a day, with the usual accompaniment of *pán* leaves. The estimated cost of maintaining an average family of the labouring class is about Rs. 8 or 16s. a month. 276 [434]

TOWNS: SHILLONG.—There are no towns in the usual acceptance of the word; but the chief places in the Hills, looked upon by the inhabitants as cities, are Shillong, Jowái, Cherrá Púnji, and Shellá. According to the Census of 1872, Shillong had only 1363 inhabitants, Cherrá Púnji 443, and Jowái 4502. Jowái, however, is a collection of rural hamlets, and the population of Shillong has entirely altered since the date of the Census. The latter place first became the Civil Station in 1864, in substitution for Cherrá Púnji; and when Assam was erected into an independent Province in 1874, it was selected as the permanent seat of the Local Government. The Chief-Commissioner resides there, and also the heads of all departments in the Administration. The area of the Station is 7 miles in length by 1½ to 1¾ miles in breadth. A considerable native population is already settled, and is increasing from day to day. One of the largest weekly markets is held in the *bázár*; and with a view to facilitate access to the Station, which is the sanitarium for the Province of Assam, a cart road has recently been completed to Gauhátí on the Brahmaputra, which will tend to make the place more and more important. An excellent water supply is introduced into Shillong through an aqueduct which has its source in the neighbouring hill streams, and sanitary measures are carefully enforced. Large sums of money have annually been expended on the erection of the public buildings necessary for the offices of the administration. A printing-press has been established, from which issue all the official documents and reports of the Province. The climate is excellent, the temperature being more equable than that of any other hill station in India, and therefore admirably suited to the constitution of Europeans. There is a church at Shillong, and a chaplain on the Bengal establishment officiates both there and at Gauhátí. The cantonments were occupied in 1875 by the 43d Regiment of Assam Light Infantry, with three outposts. The strength was 9 European officers, 16 native commissioned officers, 80 non-commissioned officers, 772 fighting men, and 58 paid camp followers and non-combatants; grand total, 935. The total cost, including contingencies, was Rs. 189,190, or £18,919.

632 632 648 [443] [743] [491] [365] [364] [344] [213] [132] [346] [712]

511 It is seen that the per family average annual expenditure is Rs.909·00 nP. in Border areas, Rs.1008 00 nP. in Project area and Rs.828·00 nP. in General area. The per family annual net income in the respective area being Rs.852·86 nP., Rs.988·84 nP, and Rs.949·51 nP. it follows that the budget of the average family is deficit in all the areas. [426] This deficit is usually made up either by restricting the consumption expenditure during the lean months of the agricultural year or by taking loans.

221 511 The field work of the survey was started during the month of February, *i.e.*, hardly after two months, of harvesting of winter paddy and during the harvesting period of cash crops like orange, betelnut, potatoes, etc. During this period people get money through the sale proceeds and naturally they [114] were tempted to spend comparatively higher amount on food. In fact, it was made clear during investigation that as lean months are approaching when people did not have money to purchase food articles, they used to lead a very austere life. This period is particularly very hard for the Border people because unlike people of other two areas they do not have even paddy in store. As the above figures of annual expenditure of a [128] family were calculated on the basis of information collected for one month [125] preceeding the date of investigation, in respect of food and non-food articles, and for one year in respect of miscellaneous items, there is every likelihood of the average per family expenditure on food and non-food articles being over-estimated.

128 511 As in the case of income, consumption of articles produced at home or at farm as well as those received out of the goods, services and gift and loan were valued in money terms on the basis of the local average retail prices in respect of the commodities concerned. Thus even firewood and other wild vegetables and fishes obtained by fishing were valued in terms of money. Of the total average expenditure on food, the food articles obtained in kind and consumed at home account for about 18 per cent in Border area, 53 per cent in Project area and 57 per cent in General area. Thus the share of food articles obtained in kind and consumed at home to the annual expenditure of a family is very low in Border area. This is natural because they depend almost exclusively on cash crop cultivation.

511 Out of the total expenditure, food account for about 68 per cent in Border area, 67 per cent in Project area and 73 per cent in General area. In all the areas cereals alone took the bulk of the expenditure on food, *i.e.*, 66 per cent, 75 per cent and 81 per cent in the respective areas

It is seen that expenditure on pulses, vegetables and milk are very low. In fact only a few of the Tribal villagers take pulses, milk and vegetables. Rice and fish or meat are the only items of the dishes of most of the villages.

Among non-food articles fuel and light accounted for 6 per cent in Border area, 5 per cent in Project area, and 5 per cent in General area. Khasis are heavy chewers of betelnut and this accounted for 5 per cent of total annual expenditure in border area, 4 per cent in Project area and about 3 per cent in General area while tobacco and tea in tea-stall accounted for about 5 per cent, 4 per cent and 4 per cent respectively of the total annual expenditure in the three areas. Expenditure on liquor

nure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Bhoi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country are paddy rice, lac, caoutchouc, cotton, bananas, and pineapples; in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmiller 1925.] **Gathering.** Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

the house of the *nongsiat*, where a *puja* is performed to some 224
local deity, before the flesh is distributed. At Shangpung, 782
when a tiger or a mithan is killed, the head is cut off, and is
carried in triumph to a hill in the neighbourhood where there [778]
is a *duwan*, or altar, at the foot of an oak tree (*dieng sning*). [776]
The head is displayed on the altar, and worship offered to
u 'lei lyngdoh, the God of the doloiship.

The Khasis make use of an ingenious species of spring gun 224
for killing game, the spring gun being laid alongside a deer 411
path in the jungle. A string stretched across the path, when touched, releases a bolt and spring, which latter impels a bamboo arrow with great force across the path. This spring gun is called *ka riam siat*. A pit-fall, with bamboo spikes at the bottom, is called *u 'liw lep*, and a trap of the pattern of the ordinary leopard trap is called *ka riam slung*. A noose attached to a long rope laid in a deer run is named *riam syrwiah*.

There is also *ka riam pap*, the principle of which is that an animal is attracted by a bait to walk on to a platform; the platform sinks under the weight of the animal, and a bolt is released which brings down a heavy roof from above weighted with stones, which crush the animal to death.

There are several means employed in snaring birds; one of 223
the most common is to smear pieces of bamboo with the gum 411
of the jack-tree, the former being tied to the branches of some wild fruit tree, upon which, when the fruit is ripe, the birds light and are caught by the bird lime. This is called *ka riam thit*. Another is a kind of spring bow made of bamboo which is laid on the ground in marshy places, such as are frequented by snipe and woodcock. This form of snare is unfortunately most common. A third is a cage into which birds are lured by means of a bait, the cage being hidden in the grass, and the entrance being so contrived that the birds can hop in but not out again. This is called *ka riam sim*.

FISHING.

Although there are some Khasis who fish with rod and line, 226
it may be said that the national method of fishing is to poison

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

231 about Rs. 30. The price of lac has risen a good deal of late
435 years. Formerly the price was about Rs. 15 to Rs. 20 a maund. The lac trade in the Jaintia Hills and in the southern portion of the Khyrim State is a valuable one. The profits, how-
426 ever, go largely to middle-men, who in the Jaintia Hills are Syntengs from Jowai, who give out advances to the Bhoi cultivators on the condition that they will be repaid in lac.
443 The Marwari merchants from the plains attend all the plains
439 markets which are frequented by the hill-men, and buy up the lac and export it to Calcutta. The whole of the lac is of the kind known as stick lac.

HUNTING.

224 The weapons used by the Khasis for hunting are bows and
[411] arrows, the latter with barbed iron heads, and spears which are used both for casting and thrusting. Before proceeding on a
[787] hunting expedition the hunters break eggs, in order to ascertain whether they will be successful or not, and to which jungle
[176] they should proceed. Offerings are also made to certain village deities, e.g. *U. Ryngkew*, *u Basa*, and *u Basa ki mrád*. A lucky day having been selected and the deities propitiated, the hunters start with a number of dogs trained to the chase, the latter being held on leashes by a party of men called *ki nong-ai-ksew*. When the dogs have picked up the scent some hunters are placed as "stops" (*ki ktem*), at points of vantage in the jungle, and the drive commences with loud shouts from the hunters, the same being continued until the object of the chase breaks into the open. The man who draws the first blood is called *u nongsiat*, and the second man who scores a hit *u nongban*. These two men get larger shares of the flesh than the others. The *nongsiat* obtains the lower half of the body of the animal, thighs and feet excepted, called *ka tdong*, and the *nongban* one of the forequarters called *ka tabla*. The other hunters obtain a string of flesh each, and each hound gets a string of flesh to itself. These hunting parties pursue deer sometimes for many miles, and are indefatigable in the chase,
224 the latter lasting occasionally more than one day. In the
782 Jaintia Hills, at the end of the chase, the quarry is carried to

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

the house of the *nongsiat*, where a *puja* is performed to some 224

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

quilt, made out of the bark of a tree, which is beaten 352
out and then carefully woven, several layers of flattened 513
bark being used before the right thickness is attained. 287
This quilt is called by the Lynngams "*Ka syllar*" (Garo *simpak*).
Food is cooked in earthen pots, but no plates are used, the broad 252
leaves of the *mariang* tree taking their place. The leaves are 415
thrown away after use, a fresh supply being required for each meal.

The Lynngams brew rice beer, they do not distil spirit; the 274
beer is brewed according to the Khasi method. Games they have 526
none, and there are no jovial archery meetings like those of the Khasis. The Lynngam methods of hunting are setting spring 224
guns and digging pitfalls for game. The people say that now the Government and the Siem of Nongstoin have prohibited both of these methods of destroying game, they no longer employ them. But I came across a pitfall for deer not long ago in the neighbourhood of a village in the Lynngam country. The people declared it to be a very old one; but this I very much doubt, and I fear that these objectionable methods of hunting are still used. The Lynngams fish to a 226
small extent with nets, but their idea of fishing, *par excellence*, is poisoning the streams, an account of which has already been given in this monograph. The Lynngams are omnivorous 262
feeders, they may be said to eat everything except dogs, snakes, the *hulok* monkey, and lizards. They like rice, when they can get it; for sometimes the out-turn of their fields does not last them more than a few months. They then have to fall back on Jobstears and millet. They eat arums largely, and for vegetables they cook wild plantains and the young shoots of bamboos and cane plants. The Lynngams are divided up into 614
exogamous clans in the same manner as the Khasis. The clans 773
are overgrown families. The Lynngams have some stories regarding the founders of these clans, of which the following is a specimen:—"A woman was asleep under a *sohbar* tree in the jungle, a flower from which fell on her, and she conceived and bore a female child who was the ancestress of the Nongsohbar clan." Some of the stories of the origins of other clans do not bear repeating. There do not appear to be any 582
hypergamous groups. As with the Khasis, it is a deadly sin to 614

won the money in the archery contest and now 527
we should have a big feast. It is full moon
now and much more beautiful during the night
than the day. Oh, we are just having a
good time." At once he swung his bunches
of leaves and hopped away. The women take
care of stirring the cooking pots. They are
not choosy about the spoon. A bamboo,
which a tired dancer might have just thrown
away, is quite adequate for this purpose.
When everything is ready, the people sit down
in groups and eat the meat. Rice brandy is
handed around. When the archers and other
guests at the festival are more than sated and
exhausted from all the dancing, they leave
the place towards morning.

It should be pointed out that contrary [262]
to their usual customs the Khasi eat no rice
at the great feast after the archery competition
but only meat, with which brandy is drunk.
There is a good deal of overindulgence in
food and drink on this occasion. (32)

32. P.F. Stegmiller, "Das Fest nach dem Pfeilschiessen" /The Feast after the Archery Contest/, Salvatoranische Mitteilungen /Salvatorian Communications/, 1910, No. 3.

4. Hunting Customs

Although there are all sorts of wild 224
animals in the Khasi hills and Jaintia hills 136
that can be hunted -- flying foxes which visit
the orange gardens during the night, jackals,
which annoy the villages with their howling,
antelopes, does, deer and wild pigs which
damage the rice fields, wild dogs, wolves,

224 bears, leopards and tigers, which seize their
136 prey not merely among the goats and calves, but also among the grown cattle, and at times are even dangerous to man; although there are lots of tasty birds -- quails, partridges, lapwings, coots and wild geese -- in spite of all this the Khasi are not actually hunters. Only when an opportunity either presents itself to catch such birds, or when a wild animal has shown itself or even caused damage in the village, then the Khasi go hunting. Exceptions occur. The Khasi who use bows and arrows from childhood on, who practise shooting conscientiously, dare to hunt bears, leopards, and tigers. [621] Today they often have guns for this purpose, but bown and arrows are always taken along.

224 When a lucky day has been determined upon
187 by egg throwing, (33) and often the hunting area

33. Dr. P.C. Becker, "Das Eierwerfen der Khasi" [Egg Throwing Among the Khasi], Anthropos, 1917-1918, pp. 494 ff.

is often determined in this way, the Khasi set
224 out with a pack of hounds. As soon as the dogs have come upon the scent of the wild animal, the Khasi begin driving it with howlings and noise. The first shooter is lucky (called u nongsiat by the Khasi) because he gets the lion's share of the prey. Whoever is the second one to hit the animal (called u nongban by the Khasi) also receives special consideration. The other shooters divide the rest of the slain animal among themselves after the hunting dogs have each been given a piece. The Khasi are very persevering on the hunt and do not bother about the time or the distance. For the efforts expended on the hunt are richly rewarded by the

triumphal procession with the slain beast through the home village. 224

A litter is prepared outside of the village of firm bamboo and decorated with palm leaves and other tree branches. In the middle of the litter a strong frame of bamboo is set up so that the spoil of the hunt (gazelle, antelope, bear, tiger, leopard, etc.) is placed on it belly down. The feet hang down stretched out. The head is held high by a forked branch, and a bunch of grass is placed in the animal's open mouth. The slain animal thus has an appearance of being alive. Arrow and bow are placed on the bier to the left and right of the animal. If the animal has been killed by a bullet, the Khasi carry the guns in their hands; if it was hit by an arrow, the first arrow which wounded it is placed in front on the bier before the animal. Then eight men lift the decorated bier with the slain animal on their shoulders and they all go towards the village with great ceremony. Blank shots announce the approach of the triumphal procession. The Khasi come from all sides. The hunters are congratulated, and all rejoice in the booty. Everybody watches the parade with pleasure. Some bring fresh rice brandy in bamboo pipes as thick as an arm; others bring betel nuts and water pipes. All this as well as other refreshments are offered the hunters. The crowd surges around the bier, and after the slain animal has been thoroughly discussed, the procession begins.

224 224 483 224

The village boys run noisily ahead. Beaters and hunters follow. Then comes the bier carried by eight men. To the left and right go the women and girls of the village, swinging branches and bunches of leaves. Shouts of joy resound. Several hundred people

224 have gathered and go either behind the bier or sit down on the edge of the road to be spectators. There is not much difference because the parade goes so slowly that it is hard to see if it is moving at all. The triumphal parade takes a full four hours to go a distance of about 800 to 900 meters. [622] Although the Khasi are never in a hurry, in this case they are the
224 slowest ever. But there is something ceremonial
533 in this and when the solo singer (the nongphawar) raises his voice in extemporaneous song, to celebrate the dead animal when the crowd answers rejoicing and shouting, assuring the singer again and again that he is doing it well and thus spurring him on to new verses, when blank cartridges are shot off and the spectators are lit up brightly by torchlight, milling around in their colorful costumes, when the rice brandy has done its share, then the climax is reached!

The solo singer goes in front of the bier,[1] but with his face always turned towards it. Gesticulating violently with his hands, he bows now to the left, now to the right; he bends his upper body now forwards, now backwards. Jumping in the air from time to time, he only shows signs of joy and praise. According to his whim and invention he sings about the animal. The crowd joins in the improvised refrain, which is sometimes a repetition of the solo song, sometimes a shout of applause.

533 The solo singer sings approximately: (34)

34. P.D. Daunderer, "Khasi-Sitten" [Khasi Customs], Missionär [Missionary] 1905, pp. 179 ff.

Solo singer: "Hey! strong mother of bears, hungrilly thou eatest thine own children!"

7 [carrying the hunters' prey-- Analyst]

533 S. : "Thou fledst into the thicket! Did that help thee?
Shyly thou retreated before the brave crowd of hunters!"
All: "Ha, ha, ho, huh!"
S. : "Quickly indeed thou retreated; quickly the pursuers pressed after thee and arrow and bow brought thee low!"
All: "Ha, ha, ho, huh!"
S. : "O mistress! Why didst thou come hither? Thou gavest thyself over to death and destruction — but we rejoice and celebrate and exult!"

Thus it continues for a long time. When one person has sung until he is hoarse, another takes his place and continues the song.

224 Exhausted from the exertions of the hunt, exhausted from the activity of the parade home, hoarse from shouting and screaming, heated from the enjoyment of brandy, the crowd drags itself to the house of the hunter who placed the first arrow or shot in the wild animal. Sacrifice is made there to the village god and the slain animal is divided up. The first shooter (u nongsiat) receives the hind quarters, the second shooter (u nongban) the front quarters of the animal.

In the Jaintia Hills the Synteng go to a hill in the neighborhood of the village when they have hunted and killed a tiger or a leopard. An altar is set up there under an oak tree and the head of the animal, which has been severed from its body, is placed on it and sacrificed to the u'lei lyngdoh (the god of the Dolloi district).

782 224

411 998 Arrow and bow are not only necessary weapons to the Khasi for hunting or pleasant sporting equipment for archery contests; Arrow and bow are also holy to him in a certain

ture and chemical fertilizers. Both level land and 241
hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the 243
lowlands, in parts of Jaintia and Bhoi, the only 184
places where the plow is found. Nowadays paddy is 178
more and more seen in the uplands, together with a simple terracing and irrigation technology. Many 244
upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country 241
are paddy rice, lac, caoutchouc, cotton, bananas, and 184
pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a sub- 226
sistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, 224
including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmiller 1925.] **Gathering.** 222
Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is [278]
no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** 231
Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is [234]
now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage [233]
freely in the fields during the winter, but are herded by a communally hired herdsboy during the agri- [235]
cultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. **Food and stimulants.** 262
The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the 264
morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods 262
are taboo to certain sibs. Stimulants are extremely 184
common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also 276
smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, 273
where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread 275
widely in the malarious Bhoi country, but controls instituted in the 1940s have been fairly successful. 276
All stimulants were once taken by men, women, and 177

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

249 648 65 at Dirjiling, who reported unfavourably on them. They have since been made over to the State of Hangkim, who is responsible for their being kept clear of weeds and protected against fire. Up to the close of 1893-94 the total expenditure had been Rs. 670, or £45, 4s. 6d.

136 Game Nature.—Tigers, elephants, rhinoceros, buffaloes, antlered or wild cows, bears, leopards, wolves, jackals, foxes, wild hog, and several kinds of deer abound in the Khasi and Jaintia Hills. The expense of keeping down tigers in the shape of Government rewards amounted to £44, 10s. 6d. in 1869-70. The rate of reward now paid is Rs. 25 or £2, 10s. 6d. per head. No reward has ever been given for the destruction of venomous serpents. The number of deaths from wild beasts and snake-bite reported to the police amounted to 28 in 1866-67, 18 in 1867-68, 16 in 1868-69, and 26 in 1869-70. The small game found in the Hills consists of black partridges, hill partridges, quails, ducks, teal, snipe, and woodcocks. The *mahsir* fish is caught in the rivers. No regular trade is carried on in the skins of wild animals; and, except in the case of wild elephants, the *few* antlers are not made to contribute towards the wealth of the people.

224 648 651 Elephants.—Wild elephants are found in the lower ranges of the hills, and in the gorges opening on the valleys of the Surma and the Brahmaputra. Each State in the Khasi Hills and each dolloi-ship in the Jaintia Hills constitutes a separate hunting circle or *mahal*. In the Khasi States the conditions of elephant hunting are governed by rules framed in 1874-75 by the Chief Commissioner, and approved by the Government of India. These rules provide, (1) that the British Government will make no claim to royalty on account of elephants caught in the Khasi Hills; (2) that one half of the proceeds of the sale of each elephant caught shall be paid over to the chief whose State forms the *mahal*, and the other half retained by Government; (3) that if a chief wishes to hunt elephants on his own account, the *mahal* composed of his State shall be reserved from sale, and a special arrangement shall be made with him on the basis that half the proceeds of the hunting shall accrue to Government. A special form of hunting licence in accordance with these rules has been settled by the Chief Commissioner. In the Jaintia Hills, as being British territory, the ordinary Assam rules are in force, in accordance with which leases of the *mahals* are sold at intervals of two years to the highest bidder or

20: Hunter G-4 (no date) 1897 ART Khasi ART

public caution. The Assam rules, as revised in 1875-76, reserve to Government the right of pre-emption at the price of Rs. 600 (£60) in the case of every elephant captured between 8 feet and 11 feet in height. For every elephant caught that is not purchased by Government, a royalty of Rs. 100 (£10) is payable within one month after capture. Certain methods of hunting are prohibited.

Population.—Prior to 1872 no attempt had been made at a Census of the Khási and Jaintia Hills, but in 1872 the Deputy-Commissioner approximately estimated the population at 116,923 souls. In 1874, at the time of the Bengal Census, operations were set on foot in these Hills, but on a less elaborate system than in Regulation Districts. In the Khási Hills, the Census of the various petty States was effected through the chiefs; in British territory in the Jaintia Hills, the *dalbeis* conducted the enumeration; while at Shillong and other places under direct administration, the work was done by officers attached to the Deputy-Commissioner's office. The results are thus returned:—Adults—males, 39,882; and females, 22,178: total adults, 62,060. Children under twelve years of age—males, 18,611; and females, 18,547: total children, 37,158. Total males, 58,493; total females, 53,725. Grand total, 121,878; proportion of males, 48·36 per cent. The total area of the District, according to the latest returns, is 6,133 square miles, which gives an average density of 19 persons per square mile. The number of villages is 1003; the number of houses, 30,332, of which 330 are returned as of the better sort.

Religion.—Divisions of the People.—The population consists almost exclusively of aborigines, tribes and races, viz. Khásis and Synengs (who form the bulk of the inhabitants of the Khási and Jaintia Hills respectively), Whites, Garos, and Kukis. The only other dwellers in the Hills are the European officials and military officers at Shillong and Chaná Pánji, with their native servants and followers, a few Bengáli officials, and the sepoys of a regiment of native infantry. The classification of the inhabitants according to religion shows:—121,183 aborigines; 365 Hindus; 60 Mahommedans; and 128 Christians, including 22 Europeans, 8 Eurasians, and 83 native converts.

Tribal Religion.—The following sketch of the physical characteristics and customs of the Khásis has been kindly furnished to me by the Deputy-Commissioner, Colonel Rice; it is reproduced almost verbatim from his report and on his authority:—

the house of the *nongsiat*, where a *puja* is performed to some local deity, before the flesh is distributed. At Shangpung, when a tiger or a mithan is killed, the head is cut off, and is carried in triumph to a hill in the neighbourhood where there is a *duwan*, or altar, at the foot of an oak tree (*dieng sning*). The head is displayed on the altar, and worship offered to *u 'lei lyngdoh*, the God of the doloiship.

The Khasis make use of an ingenious species of spring gun for killing game, the spring gun being laid alongside a deer path in the jungle. A string stretched across the path, when touched, releases a bolt and spring, which latter impels a bamboo arrow with great force across the path. This spring gun is called *ka riam siat*. A pit-fall, with bamboo spikes at the bottom, is called *u 'liw lep*, and a trap of the pattern of the ordinary leopard trap is called *ka riam slung*. A noose attached to a long rope laid in a deer run is named *riam syrwiah*.

There is also *ka riam pap*, the principle of which is that an animal is attracted by a bait to walk on to a platform; the platform sinks under the weight of the animal, and a bolt is released which brings down a heavy roof from above weighted with stones, which crush the animal to death.

There are several means employed in snaring birds; one of the most common is to smear pieces of bamboo with the gum of the jack-tree, the former being tied to the branches of some wild fruit tree, upon which, when the fruit is ripe, the birds light and are caught by the bird lime. This is called *ka riam thit*. Another is a kind of spring bow made of bamboo which is laid on the ground in marshy places, such as are frequented by snipe and woodcock. This form of snare is unfortunately most common. A third is a cage into which birds are lured by means of a bait, the cage being hidden in the grass, and the entrance being so contrived that the birds can hop in but not out again. This is called *ka riam sim*.

FISHING.

Although there are some Khasis who fish with rod and line, it may be said that the national method of fishing is to poison

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

226 the streams. Khasis, except the Wárs and the people of Shella, unlike the Assamese and Bengalis, do not fish with nets, nor do they use the bamboo-work device known by the Assamese as *pala* (পল) and *jakai* (জকাই). The method of fish-poisoning of the Khasis is the same as that described by Soppitt in his account of the tribes inhabiting North Cachar. The following is a description of how Khasis poison fish in the western portion of the district; it may be taken as a sample of the whole. A [824] large quantity of the bark of the tree *ka mynta* and the creeper *u khariew* is first brought to the river-side to a place on the stream a little above the pool which it is proposed to poison, where it is thoroughly beaten with sticks till the juice exudes and flows into the water, the juice being of a milky white colour. In a few minutes the fish begin to rise and splash about, and, becoming stupefied, allow themselves to be caught in the shallows. If the beating of the bark has been well carried out, many of the fish soon die and after a time float on the surface of the water. A large number of Khasis stand on the banks armed with bamboo scoops shaped like small landing nets, to catch the fish, and fish traps (*ki khowar*) Assamese *khokái* (খোকা) are laid between the stones in the rapids to secure [824] any fish that may escape the fishing party. Another fish poison is the berry *u soh lew*, the juice of which is beaten out in the same manner as described above.

226 Soppitt says, certain fish do not appear to be susceptible to 136 the poison, and not nearly the destruction takes place that is popularly supposed. The mahseer and the carp family generally do not suffer much, whereas, on the other hand, the river shark, the *bagh mas* of the Bengalis, is killed in large numbers. It is impossible, however, in the opinion of the writer, that the mahseer fry, which abound in these hill rivers in the spring and early summer months, can escape being destroyed in great numbers when the streams are frequently poisoned. In the neighbourhood of lime quarries and other large works where dynamite is used for blasting, this explosive is sometimes 226 employed for killing fish. The practice, however, has been strictly prohibited, and there have been some cases in which the offenders have been punished in the courts. Fish-poisoning is bad enough, but dynamiting is still worse, as with an effective

cartridge all the fish within a certain area are killed, none escape. When poisons are used, however, some fish are not affected by them, and others are only stupefied for the time being and afterwards recover. 226

FOOD.

The Khasi and Syntengs ordinarily take two meals a day, one in the early morning and the other in the evening, but labourers and others who have to work hard in the open take a midday meal as well, consisting of cold boiled rice wrapped in a leaf (*ka já-song*), cakes (*ki kpu*) and a tuberous root (*u solphlang*) which is eaten raw. They are fond of all kinds of meat, especially pork and beef, although some of the Syntengs, owing to Hindu influence, abstain from eating the latter. Unlike the neighbouring Naga, Garo and Kuki tribes, the Khasis abstain from the flesh of the dog. Both Bivar and Shadwell say the reason why the Khasis do not eat the flesh of the dog is because he is in a certain sense a sacred animal amongst them. There is a Khasi folk-tale relating how the dog came to be regarded as the friend of man. It is, however, quite possible that the Khasis may never have eaten the flesh of the dog from remote times, and it is nothing extraordinary that the Khasis should differ in a detail of diet from the neighbouring Thibeto-Burman tribes which are so dissimilar to them in many respects. The Khasis, except some of the Christian community and some of the people of the Mawkhar, do not use milk, butter, or ghee as articles of food. In this respect they do not differ from the Kacharis and Rabhas of the plains or the Garos of the hills. The Mongolian race in its millions as a rule does not use milk for food, although the Tibetans and some of the Turcoman tribes are exceptions. Before fowls or animals are killed for food, prayers must be said, and rice sprinkled on the body of the animal. The staple food of the Khasis is rice and dried fish. When rice cannot be obtained or is scarce, millet or Job's tears are used instead. The latter are boiled, and a sort of porridge is obtained, which is eaten either hot or cold according to fancy. Khasis eat the flesh of nearly all wild animals, they

WORSHIP OF NATURAL FORCES AND OF DEITIES.

133 In the Khasi Hills, especially on the southern side, there are numerous rivers, sometimes of considerable size, which find their way to the Sylhet plains through very deep valleys, the rivers flowing through narrow channels flanked by beetling cliffs which rise to considerable altitudes. The scenery in the neighbourhood of these beautiful rivers is of the most romantic description, and the traveller might imagine himself in Switzerland were it not for the absence of the snowy ranges. Of such a description is the scenery on the banks of the river Kenchi-
823 yong, the Jádukátá * or Punatit of the plains. It is in the bed
776 of the river, a few miles below Rilang, that there is the
782 curiously-arched cavity in the rock which resembles an upturned boat, which the Khasis call *Ka lieng blei* (the god's boat), and the plains people Bashanya's ship. Near to this, on the opposite side of the river, there is a rock bearing a Persian inscription, but so defaced by the action of the water as to be impossible to decipher. Like other inhabitants of mountainous countries, the Khasis reverence the spirits of fell and fall, and
226 propitiate them with offerings at stated times. A brief descrip-
782 tion of the ceremonies which are performed at Rilang, on the
776 occasion when the annual fishing in the river Punatit takes
787 place, may be of interest. The three Siems of Nongstoin, Langrin, and Nobosohpoh each sacrifice a goat to *Ka blei sam um* (the goddess of the river) before the boatmen can cast in their nets. In former times they say the passage up the river was obstructed by the goddess, who took the form of an immense crocodile: but she was propitiated by the gift of a goat, and the boatmen were then allowed to pass up the river in their boats. Hence it became necessary for the owners of the fishery to sacrifice annually a goat each to the goddess. At the time of my visit each Siem's party erected an altar in the bed of the river, in the midst of which a bough of the Khasi oak (*dieng sning*) was planted. The goats were then decapitated, it being considered an essential that the head

* Lit.: Cut by magic.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

should be severed with one blow. As soon as the head was cut off there was a rush on the part of the sacrificers to see in which direction the head faced. If the head faced towards the north or west, it was considered an evil omen; if it faced towards the south or east, a good omen. The east is a lucky quarter amongst the Assamese also. The people ended up the proceedings by giving a long-drawn-out, deep-toned chant, or *kynhoi*. Immediately after the ceremony was concluded hundreds of boats shot out from the numerous creeks, where they had been lying, and fished the river all night, the result being an immense haul, to the delight of the Lynngams, who were seen next morning roasting the fish whole on bamboo stakes, after which they consumed them, the entrails being eaten with great gusto. Such is the worship of the goddess of the Punatit.

Similar pujas take place among the people of Wár-ding (the valley of fire) before they fish in the Khai-mara river and elsewhere in the Khasi Hills. In the Jaintia Hills there is the Synteng-worship of the Kopili river, which used to be accompanied by human sacrifices, as has been mentioned above, pp. 102-104. The Myntang river, a tributary of the Kopili, must also be annually appeased by the sacrifice of a he-goat. Numerous hills also are worshipped, or rather the spirits which are said to inhabit them. One of the best known hill godlings is the deity who is thought to inhabit the little wood close to the summit of the Shillong Peak. This deity is said to have been discovered by a man named "U Shillong," who gave his name to the Shillong Peak, and indirectly to our beautiful hill station. The Siems of Mylliem and Nongkrem reverence *U'lei Shillong*, and there are certain clans who perform periodical sacrifices to this god. Probably the origin of the superstitious reverence with which U'lei Shillong is held by the Siems of Nongkrem and Mylliem is that their fabled ancestress "Ka Pah Syntiew," of whom an account will be found in the folk-lore section, took her origin from a rock not far from the Shillong Peak in the Nongkrem direction.

Rableng Hill, which is within full view of the Shillong Peak in an easterly direction, is also said to be the abode of a minor god who is periodically propitiated by the members of the Máwthoh clan of the Khyrim State with a he-goat and a cock.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

764 wood are placed around the body, and the egg; "*u'leng kpoh*," is broken, not over the stomach of the deceased, as has been sometimes supposed, but by being thrown on the pyre in the direction of the feet of the corpse. Fire is applied to the pyre, first by the *kur*, or members of the clan, and then by the children, if any, of the [782] deceased. Another fowl, "*u'iar padat*," is sacrificed, its blood being smeared round the pyre three times, and across the corpse three times. The bier is then broken to pieces, the cloths having been removed from it previously. The eatables and the jaw-bones of the sacrificial animals are then placed at the head of the pyre. After the fowl (*u'iar padat*) has been sacrificed, the three arrows already mentioned are shot from the bow, one to the north, another to the south, and the third to the east. These arrows are called *ki 'nam tynpem*. It is, perhaps, significant that the [844] arrows which are shot at death correspond in numbers with those which are used at the time of the birth ceremony. When [782] the fire has blazed up, another goat, "*u'lang dholia*," is sacrificed. In some cases all the clothes of the deceased are burnt with the body, in others the clothes are merely held over the fire and then taken away, after which they can be used (this is only in the case of poor persons). Before leaving the burning-place the relatives and friends of the deceased place betel-nuts on the pyre and bid farewell to the deceased, saying "*Khublei khie leit tam kwai sha iing u Blei ho*" (good-bye, go and eat betel-nut in 765 the house of god). When the body has been thoroughly burnt, 764 the fire is extinguished with water, and the uncalcined bones are collected by the relatives in three trips. The collectors are not allowed to turn back and pick up a bone which has been forgotten in any one of these trips. The bones thus collected are carefully wrapped in a piece of white cloth by the female relatives, and an old member of the family throws on the ground some powdered rice from a leaf, at the same time adjuring the spirit of the deceased not to trouble the *kur*, or the family, as the funeral ceremonies have been duly performed. The party then sets out to the [226] bone repository, or *mawshieng*. In front walks one who strews along the line of route leaves of the tree known by the Khasis as *dieng shit* (the berries of which are used for fishing with), and grains of rice, all the way from the pyre to the cairn.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

quilt, made out of the bark of a tree, which is beaten 352
out and then carefully woven, several layers of flattened 513
bark being used before the right thickness is attained. 287
This quilt is called by the Lynngams "*Ka syllar*" (Garo *simpak*).
Food is cooked in earthen pots, but no plates are used, the broad 252
leaves of the *mariang* tree taking their place. The leaves are 415
thrown away after use, a fresh supply being required for each meal.

The Lynngams brew rice beer, they do not distil spirit; the 274
beer is brewed according to the Khasi method. Games they have 526
none, and there are no jovial archery meetings like those of the Khasis. The Lynngam methods of hunting are setting spring 221
guns and digging pitfalls for game. The people say that now the Government and the Siem of Nongstoin have prohibited both of these methods of destroying game, they no longer employ them. But I came across a pitfall for deer not long ago in the neighbourhood of a village in the Lynngam country. The people declared it to be a very old one; but this I very much doubt, and I fear that these objectionable methods of hunting are still used. The Lynngams fish to a 226
small extent with nets, but their idea of fishing, *par excellence*, is poisoning the streams, an account of which has already been given in this monograph. The Lynngams are omnivorous 262
feeders, they may be said to eat everything except dogs, snakes, the *hulak* monkey, and lizards. They like rice, when they can get it; for sometimes the out-turn of their fields does not last them more than a few months. They then have to fall back on Jobstears and millet. They eat arums largely, and for vegetables they cook wild plantains and the young shoots of bamboos and cane plants. The Lynngams are divided up into 614
exogamous clans in the same manner as the Khasis. The clans 773
are overgrown families. The Lynngams have some stories regarding the founders of these clans, of which the following is a specimen:—"A woman was asleep under a *sohbar* tree in the jungle, a flower from which fell on her, and she conceived and bore a female child who was the ancestress of the Nongsohbar clan." Some of the stories of the origins of other clans do not bear repeating. There do not appear to be any 582
hypergamous groups. As with the Khasis, it is a deadly sin to 614

nure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Bhoi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country are paddy rice, lac, caoutchouc, cotton, bananas, and pineapples; in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmiller 1925.] **Gathering.** Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

133 they form rapids, the waters precipitating themselves down deep, rocky gorges and chasms, choked with huge boulders. Some of these gorges are very beautiful; the streams, being hemmed in between stupendous mountains and rocks covered with primeval forest, run in narrow but very deep channels swarming with fish. No islands or lakes are formed by any of the rivers, although several of them have large, deep pools. They are all unfordable during the rains.

312 UTILIZATION OF THE WATER SUPPLY.—None of the rivers are utilized as a motive power for turning machinery, although the streams on the higher plateaux might be easily turned to such an account. Their waters, however, are extensively used for the purposes of irrigation, and the hill people display great ingenuity in cutting channels or aqueducts for leading the water on to their [365] fields. It is in this manner that the Civil Station of Shillong receives its water supply. Aqueducts convey water to the houses of all the European residents; and branch channels from the main aqueduct flow through the *bázár*, and along the streets occupied [226] by the native inhabitants. No fishing towns exist in the hills; but [563] near where the rivers debouch upon the plain are some valuable fisheries, which are annually let in farm, the lessees being generally Bengálís. These fisheries yield an annual Government revenue of about £300. Embankments in order to protect the land against floods do not exist. A few embankments, or rather dams, are thrown across narrow valleys between hills, so as to create reservoirs for water. At Shillong there are a few tanks thus formed, which are both useful and ornamental.

135 MINERALS, ETC.—Coal and limestone, both of excellent quality, are found in abundance. Lower Bengal obtains nearly the whole of its lime supply from the Khásí and Jáintiá Hills. The lime is known as 'Sylhet lime,' and is obtained by quarrying from the beds of stone which line the base of the mountains along the whole length of the Sylhet boundary. The supply is literally inexhaustible. Coal out-crops at Cherrá Púnjí, Lá-ká-dong, Shellá, Máo-syn-rám, and at several other places; but as a rule it is scattered, and found in places difficult of access. The coal, however, is of excellent quality, and leaves very little ash. Stone, well adapted for building purposes, is also found. Ironstone exists almost everywhere throughout the Hills, but principally in the dependent States of Khyrim, Nongspung, Cherrá, and Mylliem. In former years the Khásiás were 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

249 648 65 at Dárjíling, who reported unfavourably on them. They have since been made over to the Siem of Nongklao, who is responsible for their being kept clear of weeds and protected against fire. Up to the close of 1875–76 the total expenditure had been Rs. 672, or £67, 4s. 0d.

136 FERÆ NATURÆ.—Tigers, elephants, rhinoceros, buffaloes, *mithuns* or wild cows, bears, leopards, wolves, jackals, foxes, wild hog, and several kinds of deer abound in the Khási and Jáintiá Hills. The [224] [648] expense of keeping down tigers in the shape of Government rewards amounted to £44, 10s. 0d. in 1869-70. The rate of reward now paid is Rs. 25 or £2, 10s. 0d. per head. No rewards have ever been given for the destruction of venomous serpents. The number [165] of deaths from wild beasts and snake-bite reported to the police amounted to 28 in 1866-67, 18 in 1867-68, 16 in 1868-69, and 26 in 1869-70. The small game found in the Hills consists of black partridges, hill partridges, quails, ducks, teal, snipe, and woodcocks. 226 439 The *mahsir* fish is caught in the rivers. No regular trade is carried on in the skins of wild animals; and, except in the case of wild elephants, the *feræ naturæ* are not made to contribute towards the wealth of the people.

224 648 651 ELEPHANTS.—Wild elephants are found in the lower ranges of the hills, and in the gorges opening on the valleys of the Surmá and the Brahmaputra. Each State in the Khási Hills and each dolloiship in the Jáintiá Hills constitutes a separate hunting circle or *mahál*. In the Khási States the conditions of elephant hunting are governed by rules framed in 1874-75 by the Chief Commissioner, and approved by the Government of India. These rules provide, (1) that the British Government will make no claim to royalty on account of elephants caught in the Khási Hills; (2) that one half of the proceeds of the sale of each elephant caught shall be paid over to the chief whose State forms the *mahál*, and the other half retained by Government; (3) that if a chief wishes to hunt elephants on his own account, the *mahál* composed of his State shall be reserved from sale, and a special arrangement shall be made with him on the basis that half the proceeds of the hunting shall accrue to Government. A special form of hunting licence in accordance with these rules has been settled by the Chief Commissioner. In the Jáintiá Hills, as being British territory, the ordinary Assam rules are in force, in accordance with which leases of the *mahálls* are sold at intervals of two years to the highest bidder at

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

[499] this manner, the males earning on an average 8 annas and the
463 females 6 annas a day. Col. Bivar writes that in 1875 the
465 wages for ordinary male labourers were 4 to 8 annas a day, and for females 2½ to 4 annas, so that the wages rates have almost doubled in the last thirty years. Contractors, however, often manage to obtain daily labour at lower rates than those paid by
482 Government. Stonemasons and skilled labourers are able to
241 get higher rates. It is easier to obtain coolies in the Khasi than in the Jaintia Hills, where a large proportion of the popu-
461 lation is employed in cultivation. The Khasis are excellent labourers, and cheerful and willing, but they at once resent bad treatment, and are then intractable and hard to manage. Khasis are averse to working in the plains in the hot-weather months.

APICULTURE.

•231 I am indebted to Mr. Rita for the following remarks on apiculture in the Khasi and Jaintia Hills.

There are two kinds of indigenous bees in the Khasi Hills, one domesticated, called *u ngap* (*apis Indica*), and the other *u lywai*, which is never domesticated, and is very pugnacious; its hives are difficult of access, being always located in very high cliffs. A few hives of a third class of bee are now-a-days to be found in and around the station of Shillong, i.e. the Italian.
[177] This bee was imported into the hills by Messrs. Dobbie and Rita, and the species became propagated in the following manner. The bees had been just established in a hive, where they had constructed a brood comb, when the hive was robbed by some Khasis for the sake of the *larvæ* it contained, which they wished to consume as food; but the queen bee escaped and established other colonies, one of which was afterwards captured by Mr. Rita, the others establishing themselves at places in the neighbourhood. The hive used by the Khasis is of a very primitive description. It is usually a hollow piece of wood, about 2½ to 3 ft. in length and 10 or 12 in. in diameter. A small door is placed at each end of the log, one for the bees to go in and out, and the other for the removal of the honey when wanted. The honey-combs are broken and the honey is

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

extracted by squeezing the comb with the hand. Wax is 231
obtained by placing the comb in boiling water and allowing it to cool, when the wax floats to the surface. The Khasis do not systematically tend their bees, as they do not understand how to prevent swarming, and as the Khasi bee is a prolific swarmer, hives become weak very soon and a new hive has to be started from a captured natural swarm. The villages in which bees are regularly kept to any large extent in the Khasi and [438]
Jaintia Hills are Thied-dieng, Mawphoo, Nongwar, Mawlong, Pynter, Tyrna, and Kongthong, but most of the Wár villagers rear bees and sell the honey at the neighbouring markets. The collection of the honey of the wild bee, or *u lywai*, is a hazardous occupation, the services of some six or seven persons being required, as the combs of this bee are generally built in the crevices of precipitous rocks, and sometimes weigh more than half a maund each. When such hives are discovered the bees are driven out by the smoke of a smouldering fire lit at the foot of the rock below the hive. Two or three men get to the top of the precipice, leaving two or three of their companions at the base. One of the men on the top of the rock is then lowered down in a sling tied to a strong rope, which is made fast by his companions above to a tree or boulder. The man in the sling is supplied with material to light a torch which gives out a thick smoke, with the aid of which the bees are expelled. The man then cuts out the comb, which he places in a leather bucket or bag, which, when filled, he lowers down to the persons in waiting at the foot of the rock. The wild honey may be distinguished from that of the domestic bee by being of a reddish colour. Honey from the last-mentioned bee is gathered twice or thrice in the year, once in the autumn and once or twice in the spring; that gathered in early spring is not so matured as that collected in autumn. The flora of the [137]
Khasi Hills being so numerous, there is no necessity for providing bees with artificial food. The bees are generally able to obtain their sustenance from clover, anemonies, "golden rod," bush honeysuckle, and numerous shrubs such as andromeda, daphne, &c., which abound about Shillong. There seem to be facilities 231
for apiculture on a large scale in these hills, and certainly the 263
honey which is brought round by the Khasis for sale in

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

231 Shillong is excellent, the flavour being quite as good as that
263 of English honey. Under "Miscellaneous Customs connected with Death" will be found a reference to the statement that the
[764] dead bodies of Siems used to be embalmed in honey. The existence of the custom is generally denied by Khasis, but its former prevalence is probable, as several trustworthy authors have quoted it.

HOUSES.

342 The houses of the people are cleaner than might be supposed
515 after taking into consideration the dirtiness of the clothes and persons of those who inhabit them. They are as a rule substantial thatched cottages with plank or stone walls, and raised on a plinth some 2 to 3 ft. from the ground. The only
354 window is a small opening on one side of the house, which admits but a dim light into the smoke-begrimed interior. The beams are so low that it is impossible for a person of ordinary stature to stand erect within. The fire is always burning on an earthen or stone hearth in the centre. There is no chimney, the smoke finding its exit as best it can. The firewood is placed to dry on a swinging frame above the hearth. In the
343 porch are stacked fuel and odds and ends. The pigs and calves
342 are generally kept in little houses just outside the main building. The Khasi house is oval-shaped, and is divided into three rooms, a porch, a centre room, and a retiring-room.

354 In olden days the Khasis considered nails *sang*, or taboo, and
784 only used a certain kind of timber for the fender which surrounds the hearth; but they are not so particular now-a-days. In Mawkhar, Cherrapunji, and other large villages, the walls of
342 houses are generally of stone. In Cherrapunji the houses are frequently large, but the largest house I have seen in the hills is that of the Doloi of Suhtnga in the Jaintia Hills, which measures 74 ft. in length. The house of the Siem Priestess at Smit in the Khasi Hills is another large one, being 61 ft. long by 30 ft. broad. In front of the Khasi house is a little space fenced in on two sides, but open towards the village street. The

1. Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

of them, more especially when the latter are situated in places where jungle is dense, and there is fear of attacks from wild animals. In the Lynngam village is to be seen a high bamboo platform some 20 to 30 ft. from the ground, built in the midst of the village, where the elders sit and gossip in the evening. 361

All the villages, Khasi, Wár, Lynngam and Bhoi, swarm with pigs, which run about the villages unchecked. The pigs feed on all kinds of filth, and in addition are fed upon the wort and spent wash of the brewings of country spirit, or rice beer, the latter being carefully collected and poured into wooden troughs. The pigs are of the usual black description seen in India. They thrive greatly in the Khasi villages, and frequently attain extreme obesity. 361 231 274

In the Khasi villages of the high plateaux are often nowadays potato gardens, the latter being carefully protected from the inroads of pigs, calves, and goats by dry dikes surmounted by hedges. 24 417

I noticed an interesting custom at a Bhoi village in Nongpoh of barricading the path leading to the village from the forest with bamboo palisading and bamboo *chevaux de frise* to keep out the demon of cholera. In the middle of the barricade there was a wooden door over which was nailed the skull of a monkey which had been sacrificed to this demon, which is, as amongst the Syntengs, called *khlam*. 751 776 782

FURNITURE AND HOUSEHOLD UTENSILS.

As in the case of houses, so with reference to furniture, the influence of civilization shows many changes. The Khasi of the present day who lives in Mawkhar * has a comfortable house regularly divided up into rooms in the European style with even some European articles of furniture, but owing probably to the influence of the women, he still possesses several of the articles of furniture which are to be met with in the houses of those who still observe the old style of living. Let us take the furniture of the kitchen to begin with. Above the hearth is slung by ropes of cane a swinging wooden framework 352 352 417

* Mawkhar is a suburb of Shillong, the headquarters station.

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

mould. The plant[1] is watered by means of small bamboo aqueducts which are constructed along the hill-sides, the water being conducted along them often considerable distances. As in the plains, the leaves of the *pán* creeper are collected throughout the year.

The bay leaf (*'la tyrpád*, or *tezpát*) is classified in the *Agricultural Bulletin* as *Cinnamomum tamala*, and there is a note in the column of remarks that "this tree, as well as one or two others of the same genus, yields two distinct products, *tezpát* (bay leaf) and cinnamon bark." The bay leaf is gathered for export from the extensive gardens in Maharam, Malaisohmat, Mawsynram, and other Khasi States. The plants are raised from seed, although there are no regular nurseries, the young seedlings being transplanted from the jungle, where they have germinated, to regular gardens. Bay leaf gardens are cleared of jungle and weeds periodically; otherwise no care is taken of them. The leaf-gathering season is from November to March. The leaves are allowed to dry for a day or two in the sun, and then packed in large baskets for export. The gathering of bay leaf begins when the trees are about four years old.

The following are the other minor crops which are grown in the Khasi and Jaintia Hills:—

Pineapples, turmeric, ginger, pumpkins and gourds, the egg plant, chillies, sesamum, and a little sugar-cane. The arum* (*la shirie*) is also extensively grown in the hills, and forms one of the principal articles of food amongst the poorer classes; it is generally raised in rotation with potatoes, or is planted along with Job's tears. The stem of the arum is sometimes used as a vegetable, also for feeding pigs.

In the Jowai Sub-Division, notably at Nartiang, there are fairly good mangoes, which are more free from worms than those grown in the plains of Assam.

The Bhois and Lynngams cultivate lac. They plant *arhar dal*, *u landoo*, in their fields, and rear the lac insect on this plant. Last year the price of lac at Gauhati and Palasbari markets rose as high as Rs. 50 per maund of 82 lbs., it is said, but the price at the outlying markets of Singra and Boko was

* Colocasia esculenta, Beng. *Kacha*.

[1] [i.e., the pán .... Analyst]

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

231 about Rs. 30. The price of lac has risen a good deal of late
435 years. Formerly the price was about Rs. 15 to Rs. 20 a maund. The lac trade in the Jaintia Hills and in the southern portion of the Khyrim State is a valuable one. The profits, how-
406 ever, go largely to middle-men, who in the Jaintia Hills are Syntengs from Jowai, who give out advances to the Bhoi cultivators on the condition that they will be repaid in lac.
443 The Marwari merchants from the plains attend all the plains
439 markets which are frequented by the hill-men, and buy up the lac and export it to Calcutta. The whole of the lac is of the kind known as stick lac.

---

224 The weapons used by the Khasis for hunting are bows and arrows, the latter with barbed iron heads, and spears which are
[411] used both for casting and thrusting. Before proceeding on a
[787] hunting expedition the hunters break eggs, in order to ascertain whether they will be successful or not, and to which jungle they should proceed. Offerings are also made to certain village
[178] deities, e.g. *U. Rynglew*, *u Beem*, and *u Hasa ki mréd*. A lucky day having been selected and the deities propitiated, the hunters start with a number of dogs trained to the chase, the latter being held on leashes by a party of men called *ki nongai-beem*. When the dogs have picked up the scent some hunters are placed as "stops" (*ki ktem*), at points of vantage in the jungle, and the drive commences with loud shouts from the hunters, the game being continued until the object of the chase breaks into the open. The man who draws the first blood is called *u nongpiet*, and the second man who scores a hit *u nongbon*. These two men get larger shares of the flesh than the others. The *nongpiet* obtains the lower half of the body of the animal, thighs and feet excepted, called *ka tdong*, and the *nongbon* one of the forequarters called *ka tabla*. The other hunters obtain a string of flesh each, and each hound gets a string of flesh to itself. These hunting parties pursue deer sometimes for many miles, and are indefatigable in the chase,
224 the latter lasting occasionally more than one day. In the
782 Jaintia Hills, at the end of the chase, the quarry is carried to

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

a similar custom prevalent amongst the Khyrwangs. The Nongtungs, in the Jaintia Hills, keep dead bodies sometimes as long as a month, until the *pâur* or ceremonial dance has been performed. Hence they are called *Nong-tung*, or "stinkers." Amongst the Lyungams the dead body is kept for sometimes three or four months, or up to the time when a bull can be procured for a feast to the villagers. This feast is an essential, and, cattle being scarce in the Lyungam country, there is often great delay in disposing of the body. Lyungam villages at such a time are best avoided. The Lyungams of Nongsohbar bury the unburnt bones of the deceased within the village, and in front of the house occupied by the deceased when alive, the bones being placed in a hole in the ground, over which is laid a stone, a bamboo being hewn over the stone. A bamboo fence three or four feet high is erected round the grave. Other Lyungams bury the uncalcined bones and ashes in a gourd in the jungle near the burning-place. On their way home, the members of the clan of the deceased who have come from other villages to witness the funeral obsequies, put up a stone on the path in honour of the deceased, a turban being tied round the top of the stone. The Garos or Dkos, who live at the foot of the hills on the Kamrup border, and are called by the Assamese *Hana* (spear-men), erect memorial stones in honour of the deceased, the lower jaw-bones of sacrificial animals and other articles being hung on the stones. The stones are also swathed in cloths, and turbans are tied round the tops. The death customs of the Lyungams, and, indeed, other customs also, are partly Khasi and partly Garo, it being difficult to say that the Lyungams are more Khasi than Garo, or more Garo than Khasi in this respect: their language, however, has been found by Dr. Grierson to be a corruption of Khasi. In Nongstoin, Mawlih, and Mariaw villages, the inhabitants of which profess to be Khasis, the bones and ashes of the deceased are not collected and placed in repositories, as at Cherrapunji. At Mariaw and Nongstoin a large wooden coffin is used, painted white, with ornamentations on the outside, and standing on four legs. This coffin is not burnt on the funeral pyre. In the family of the chiefs of Cherra, the body of a deceased Siem is subjected to the following process:—It is wrapped in a cloth

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

wonderful mass of granite known by the name of the Kyllong Rock will be found in the section of the monograph which deals with geographical distribution. I have also added a photograph of the rock. The Syntengs have a story that when the strong west wind blows in the spring this is due to the advent of *U Kyllang*, who comes to visit his wife, the river *Umngot*, at that season: amongst the Khasis hills are all of them masculine, but to rivers is usually attributed the feminine gender. U Symper is another isolated rocky eminence rising from the Maharam plain close to the village of Kmawan. The best view of the hill is obtainable from Laitmawsiang on the path to Mawsynram. The village of Mawmai every traveller from Therria to Cherrapunji knows. It is chiefly remarkable for a fairly large limestone cave, and its fine memorial stones. The Khasi theory to explain how the moon got its spots is, I believe, original, but is no more extraordinary than our own nursery tale about the "man in the moon." The *Sohpet Byrong* hill is the first hill of any size that the traveller sees on the Gauhati road when journeying to Shillong. It is close to Umsning Dak Bungalow. There are caves in the hill which are tenanted by bears. Strange to say, according to Khasi ideas, this is one of the highest points in the hills; in reality *Sohpet Byrong* is some 2,000 ft. lower than the Shillong Peak. As mentioned elsewhere, the Khasis are very fond of dogs; so I have given their version of how the dog came to live with man. The well-known Khasi superstition will be found fully described under the heading of "Human sacrifices." I have, however, thought the tale of sufficient interest to reproduce at length here. The story of the river Rupatylli is a pretty tale, and is just such a one as would appeal to the imagination of mountaineers like the Khasis. The Kopili story is important, in that it indicates the origin of human sacrifices in the Jaintia Hills; it also throws, perhaps, some light on the question of the use to which the flat table memorial stones were put in years gone by. The superstition about the crossing of the Kopili can be vouched for by many who have taken the journey from the Jaintia Hills to North Cachar by the Kopili route. Mawpunkyrsiang is a small village close to Cherrapunji. The weird tale about the Siem of Malyriang is the pride of the Mawkut people, for in olden days their King,

Ic Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

This stone is apparently some rough gem which may be picked up by the Lyngams in the river beds. A rich man amongst them, however, is one who possesses a number of metal gongs, which they call *wing*. For these they pay very high prices, Rs. 100 being quite a moderate sum for one of them. Being curious to see one of these gongs, I asked a *sirdar*, or head-man, to show me one. He replied that he would do so, but it would take time, as he always buried his gongs in the jungle for fear of thieves. Next morning he brought me a gong of bell metal, with carvings of animals engraved thereon. The gong when struck gave out a rich deep note like that of Burmese or Thibetan gongs. These gongs have a regular currency in this part of the hills, and represent to the Lyngams "Bank of England" notes. It would be interesting to try to ascertain what is their history, for no one in the Lyngam country makes them in these days. Is it possible that the Garos brought them with them when they migrated from Thibet? The gongs are well known in the Garo Hills, and I hear that when a *sirdar*, or head-man, dies his corpse is laid out upon them. They thus possess also an element of sanctity, besides being valuable for what they will fetch to the Garos or Lyngams. We may hope to hear more about them in Captain Playfair's account of the Garos.

The Lyngams do not tattoo. Their weapons are the large-headed Garo spear, the dao, and the shield. They do not usually carry bows and arrows, although there are some who possess them. They are by occupation cultivators. They sow two kinds of hill rice, red and white, on the hill-sides. They have no wet paddy cultivation, and they do not cultivate in terraces like the Nagas. They burn the jungle about February, after cutting down some of the trees and clearing away some of the debris, and then sow the paddy broadcast, without cultivating the ground in any way. They also cultivate millet and *Job's tears* in the same way. With the paddy millet are sown the first year. The egg plant, arum, ginger, turmeric, and sweet potatoes of several varieties are grown by them in a similar manner. Those that wear the lac insect plant feeder tree (Hindi *sikal doi*) in the lowest clearings, and wear the insect thereon. Some of these people, however, are prohibited by a

1:Garden E-4, 5 (no date) 1907 AR7 Khasi AR7

custom of their own from cultivating the *lendu*, in which case they plant certain other trees favourable to the growth of the lac insect. The villages are situated near their patches of cultivation in the forest. The villages are constantly shifting, owing to the necessity of burning fresh tracts of forest every two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the houses are raised some 3 or 4 ft. from the ground on platforms, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading chillies and other articles to dry. Some Lyngpun houses have only one room in which men, women, and children are all huddled together, the hearth being in the centre, and, underneath the platform, the pigs. Well-to-do people, however, possess a sitting room, where husband and wife sleep. A house I measured at Nongkhlaw village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a mere custom. In some Lyngpun villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the village festivities go on. These are similar to the *dekadang* or bachelors' clubhouses of the Mikirs, Garos, and Lalungs, and to the *dormitory* of the Naga. This is a custom of the Tibeto-Burman tribes in Assam, and is not a Khasi institution. There are also high platforms, some 12 ft. or 15 ft. in height, in Lyngpun villages, where the elders sit of an evening in the hot weather and take the air. Lyngpun houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lyngpun keep pigs, they do not seem to be as much as evidence as in the Khasi village. There is hardly any furniture in a Lyngpun house. The Lyngpun sleeps on a mat on the floor, and in cold weather covers himself with a [illegible]

us take such a clan mother with the name Ka Sing Lau. She has two sons and five daughters, and in addition two brothers and two sisters who are all married. Also each of the five daughters and two sisters has four children. These forty-six people live with the clan mother and form the family clan of the Lau. To these we also add the sons and brothers, the nephews and grandsons, but not their children. The latter have nothing to do with the family Lau but belong to the family clan of their wives, live with that clan and are counted in it. Likewise neither the husband of Ka Sing Lau, nor the husbands of the various daughters, sisters, nieces, and granddaughters belong here. They are all counted with their own clans, live and work with them according to Khasi custom, and only visit their wives occasionally perhaps after dark.

The entire clan-family of Lau is housed in 5 or 6 huts, which all stand next to each other in a semicircle or are built one above the other on the slope of a hill, according to the character of the land. A garden frequently surrounds them in which maize, sweet potatoes, potato-like roots of Sob-ot and Schrut, bananas and, on the southern slopes of the Khasi Mountains, also coffee, pineapples, and other fruits are cultivated. A circle of bamboo cane that is so important for building purposes, household objects, and /130/ implements surrounds the garden and huts. This bamboo cane grows up as thick as an arm to a height of 10 or 15 meters and at the same time forms a good protection against bad weather. A wall (murwha) of thrown-up earth encloses everything, forming an enclosed farm, prevents unimpeded access, and protects cattle and crops from the attacks and devastations of wild animals.

What is considered the family property of such a clan? Primarily it is the land, the gardens, the rice fields, woods, fallow mountain and grazing lands. On the southern slopes of the Khasi Mountains there are fields for the cultivation of rape, orange groves, laurel groves, plantations of betel palms and of pepper leaves which far and wide are so highly treasured for betel chewing as a source of pleasure. (2)

2. Cf. Becker, Im Stromtal des Brahmaputra, /In the River Valley of the Brahmaputra/ (Munich, 1923), pp. 307 ff.

Usually there is so much land available that the family-clan can nourish itself properly and also increase in number.

According to its size and wealth a family clan also owns a corresponding number of cows, oxen, horses, pigs, and goats. Neither the milk nor the flesh of the cows is used. They are kept for the

423 manure, and primarily for breeding, since the oxen cannot be dis-
● 23 pensed with for the cultivation of the fields, especially of the rice fields, where the soaked earth must be trampled to a slimy mush. From the fowl the eggs are particularly prized, since they find an almost daily use in the questioning of oracles in cases of misfortune and sickness. (3) Hens, pigs and goats serve for sacrificial purposes, (4)

and at the cremation of the dead.

421 Further the various huts belong to the family property, the erec-
613 tion and maintenance of which is the work of the members of the clan, the brothers, nephews, and grandsons. The hut of the clan mother is likewise considered the center of the whole family, and its possession forms the outer sign of the dominance of the clan mother. Here she holds the family sacrifices and also keeps the special treasures. These are considered to be those things which are connected with the religious cult. Special reverence and sacrifice is due the oldest clan mother, as the original founder of the clan, and her brother in each clan family; in addition there are a series of other spirits which vary according to the family clan. The branch of the Khasi people who live in the Jaintia Mountains, the so-called Synteng, have probably pre-
78 served the old Khasi customs the most faithfully. There in the hut of the
78 clan mother are found the following utensils for the service of the divinities, who are nearly always feminine; mats, little baskets for rice, gourd bottles, a little basket made of bamboo cane and decorated with feathers, as well as antlers of deer or antelopes. The latter are fastened to the wall; they are supposed to be the seat of the

nure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Bhoi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country are paddy rice, lac, caoutchouc, cotton, bananas, and pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmüller 1928.] **Gathering.** Khasis once gathered about 180 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls instituted in the 1960s have been fairly successful. All stimulants were once taken by men, women, and

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmiller 1924a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

778 objects are stored while that of the west (kynram blang) was meant exclusively
796 for sacrificial goats. There is a very big circular courtyard in front of the building where the members of the royal family as also other boys and spinsters
[193] hold a ritual dance. The function is always held during the moonlit period of
[443] May or June and the actual dates are fixed in consultation with the Chief priest
[202] (*Sohblei*) in such a way that the first day—*Pamtiah** always coincides with the market day of Shillong Chota Bazar. The dates of the festival is then communicated to the in-charge of different units of his territory, through a wooden stick '*kyrwoh*' having a few knots of cane-strips, as a form of summons for attending the festival for five days at Smit along with subjects under their jurisdiction.

IMPORTANT PARTICIPANT

796 The responsibility of performing this ritual rests on the High-priestess
793 (*Ka Siem Sad*) who is succeeded by her eldest daughter. Different ritual ob-
562 jects are procured by her, well in advance and it is obligatory on her part to join the ceremonial dancing, in which her daughter may also officiate on her
[769] behalf. U Shillong is worshipped by the chief priest while the other ancestors
[533] are invoked by lesser priests. The musicians (*Dhulia*) besides their normal duties, take part in the worship of the ancestors and they are presented with silk turban, jacket, cloth, by the ruling family for the services rendered during the festival. The *Siem* has no especial role except to supervise and evoke U Shillong for the welfare of the community. He is required to perform certain sacrifices, failing which his heir-apparent (*Siem kynnah*) does the same. He along with his sister (High priestess) abstain from taking rice during the period of celebration presumably to observe the sanctity of this festival as also to ensure the successful conclusion of the function.

RITUAL MATERIALS

796 The festival derives its name from the sacrifice of a large number of goats
782 some of which were supplied from the State fund and from different units of the territory. Formerly at least fifty goats were required and each unit had
• 231 a specific allotment but owing to the economic difficulty that the Khasi are experiencing, the number of goats sacrificed hardly exceeds twenty-five. The goats collected from the different units, are presented to the Chief at the midnight
[273] of the third day. Rice-beer, dried fish, fermented-rice, betel leaves together
[276] with nuts are also important ritual objects in this celebration.

DESCRIPTION OF THE FESTIVAL

796 The commencement of the festival was marked by the distribution of dried,
782 fish (suit dokha) to the persons assembled on the occasion, in the evening of *Pamtiah* (*i.e.* 21st June, 1957). This was followed by the dropping of rice-beer by the Chief priest over the fire place of central hall known as *Ka suit-ka shor*

---

[805] *A week consists of eight days in Khasi Calendar the names are according to the places where markets are held in Khasi Hills.

Name	Market
1. Pamtiah	Shillong Chota Bazar.
2. Umai	Cherrapunji.
3. Yew-duh	Shillong Burra Bazar.
4. Lyngka	Barapani.
5. Kongkrem	Kongkrem.
6. Mawlong	Laban (Shillong).
7. Ryngkep	Cherrapunji Chota Bazar.
8. Shillong	Laitkyng Iaw.

17: Banerjee E-5 (1955) 1962 AR7 Khasi AR7
Smit

796 The goats were sacrificed by his sister's eldest son (*Siem-khynnah*) and in
782 charge of respective units at the open courtyard. The priests evoked the
ancestors and ancestress and called upon them by name praying 'Oh God and
769 Goddess, I offer this sacrifice as our ancestors did. Bless the *Siem*, his family
and the people of his state. I shall beseech you again on this day after one
• 231 year. You create favourable weather by virtue of your power, bring clouds and rains to yield bumper crops and ensure a happy and prosperous life.'

On the last day (Nongkrem), a man of Mawroh clan sacrificed a pig introducing an iron spike in its left armpit. Nine pieces of meat from different parts of the pig's body were again offered to their five ancestors. The *Siem* in the presence of his *Darbar* performed the last item of festival by praying to U Shillong, when the Chief of Rynjah clan also followed in the same way for seeking the blessings of their Chief deity.

This brought the ritual to an end performed at the residence of *Siem*. The five pieces of goat's and pig's meat offered to their five ancestors, were then handed over to the in-charge of the five units considered as somewhat higher in their State organisation. They distributed them at a suitable place in their unit, making a feast as a sort of public declaration of the completion of their greatest festival for the year.

DANCING

535 Besides the ritual described above, dance with the accompaniment of music
796 formed an important aspect of this festival. A dance known as *sad-tyngkoh*
had been a regular feature for the first, second, third and fifth day. This dance
[533] has some interesting features. It has to be performed in pairs. The first pair was constituted by Chief priest and the Chief musician. Second to fifth pairs were between the Sardars of the eight units after which Siem along with an official of his council constituted the sixth pair. The subsequent pairs were formed by any two persons from the gathering. They danced only after bowing first before the Oak pillar (Rishot), then to *Siem* on the fifth day. This pairing was then not adhered to on completion of the last rite of the festival.

A second type of dance (*Ka sad mastieh*) was then performed in the courtyard by the musicians as well as by the professional dancers (nong-shad) with sword and fly-brush in the afternoon of the third day. The dance was always
[291] held in pairs first by musicians, and then dancers, who donned their traditional
[301] dress consisting of silk turban (Jainspong) decorated with feathers, coloured sleeveless coat (Jymphong) silver chains and coral necklaces. Later on they joined the procession, that went to the adjacent hill where after the completion of the ceremony of goat killing, a group dance was performed returning to the residence of *Siem* ultimately.

This dance (*sad-nokkjat*) was performed by the Siems family. It was held early in the morning of the fourth day in the central hall (Shlur) and also
[291] in the courtyard. The men put on their normal dress whereas the women
[301] dressed themselves with gold and silver crown (pansngiat), numerous silver ornaments and different coloured blouse. They dressed and braided the hairs into a knot just at the nape. The High Priestess who also danced with
[302] the membes of the Siems' family, stood in the middle of the line and chief musician stood at one end. They hold each other in hand and danced round the fire-place of the central hall (Shlur) in anti-clock-wise direction in accompaniment of music. The people assembled there, gave vent to their feeling in their customary way every time, before they resumed to make it three times. Similar performance of dances were also held in the courtyard.

on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in April-May and ripens in August - September. For potato, generally three crops are raised in the district ; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

For oranges and betelnut the orchards are cleared of weeds twice a year. Harvesting of orange takes place from October to January. Betelnut ripens at the beginning of the year and are collected between February and May.

2.6.3 Agricultural implements.—The usual agricultural implements are a hoe, a sickle, three or four kinds of doas, a harrow, a crowbar which is used for the construction of irrigation channels, 'sierras' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and resembles the one in use in the plains of the State.

2. 6. 4. General cultural practices.—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

2.7 Cottage Industries.—Cottage Industries, it appears, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, pottery, baskets, mats and jewellery. In striking contrast with other districts weaving of cotton clothes is rare among the Khasis. The Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir Hills practice it only for their domestic consumption. At present, the Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

2.8 The People.—The Khasis and Jaintias are a short sturdy race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free from any inhibition. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.38 percent and 3·27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

2.9 Occupation.—The greater portion of the population of the district subsists on cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

and even the well to do ones do not feel anything to work as labourers in other's farms. It is almost customary among the agriculturists to work in other's farms on wage basis, when agricultural operation in one's own farm are over. This is probably an outcome of the difficult transport situation. Among the non-agriculturists and those who follow agriculture as subsidiary occupation, a large number are porters and labourers engaged in jobs like transporting of goods from place to place, collection of limestone, sand, fuel, Collieries and forests of the district also offer employment to a good number of people. Since the taking up of road programme under the plan, a large number of people are getting employment in construction of roads, etc. It is heartening to note that for construction of roads, nay for all kinds of works demanding unskilled labourers, the district locally supplies the whole labour force. People in the various local points of the district, particularly those living in higher hills are mainly engaged in trade. The Khasis are indefatigable traders and have been able to keep almost the whole of the small trade in the district in their own hands. A small proportion of the people are engaged in cottage industries such as stone cutting, brick making, bee keeping, blacksmithy, cane and bamboo works, etc.

The number of persons returned in the 1951 census under each of the eight main livelihood classes for the rural tract of the district was as follows.

TABLE 1

Number of Persons (Source 1951 Census)

Head	Male	Female	Total	P.C.
(1)	(2)	(3)	(4)	(5)

4.10 **Cottage Industries.**—It has already been mentioned that Village 433 and Cottage Industries are not very popular in the district.

The following table shows the industries reported from the sample villages:—

TABLE B-9

Industry	No. of villages reporting existence of the industries.	No. of villages reporting production for sale.	
(1)	(2)	(3)	
Cane and bamboo works ...	9	7	322
Blacksmithy	5	5	326
Tailoring	2	2	294
Handloom	...	...	286
Weaving and Spinning ...	3	1	284
Rearing of cocoons, etc. ...	1	1	283
Rearing of lac	1	1	231
Others	2	1	

Blacksmithy and making of baskets, cane products, etc, out of cane and bamboo, are a traditional occupation. Weaving and spinning of cotton, rearing of endi cocoon and weaving of endi, etc., are in vague only in the Bhoi area and the areas adjoining Kamrup and North Cachar and Mikir Hills districts. Lac rearing is found in the northern portion of the district, *i.e.*, Nongpoh area. [184]

Except cane and bamboo works and blacksmithy other industries are practised in a very limited scale. There is thus a lot of scope for introducing cottage industries in the district.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

There is considerable trade carried on in
245 *tezpát* or bay leaves, the trees being extensively cultivated by the
439 inhabitants of the lower slopes of the hills on the Sylhet border. The finest oranges in India are also grown in groves in the same tract, the value of the trade in which is now (1876) estimated to amount
237 to £3760 per annum. Lac is gathered by the Míkírs in the Jáintiá
439 Hills, but not to any great extent. Bees are both domesticated and found wild, and an extensive trade in bees-wax is carried on,
231 the amount exported being estimated at from three hundred to four hundred *maunds* annually. The whole of the Hills, where there is
233 no forest, and where the land is not under cultivation, consists of
621 rich pasture grounds, which are held in common by the villagers
651 and pay no revenue to Government.

137 The forests of the Khásí and Jáintiá Hills do not yield much profit either to the British Government or to the chiefs. There
[648] are no reserved forests in the District; and according to the Deputy-Conservator, the total area of unreserved forest, *i.e.* of land covered
[659] with timber trees and not at present required for *júm* cultivation, is only 150 square miles. The trees found are chiefly pine, and those classified as 'mixed upper hill forests.' At an elevation of 3000 feet, the Pinus Kasia predominates over all other vegetation and forms almost pure pine forests. It is found also at lower heights, and there attains larger dimensions, but only in the case of isolated trees. The 'mixed upper hill forests' are confined to a series of sacred groves, which clothe the topmost ridge of the watershed between the valleys of the Brahmaputra and Surmá. The characteristic trees are those of a temperate vegetation, chiefly consisting of oaks, chestnuts, magnolia, Schima, Cinnamomum, Prunus, Engelhardtia, etc. There are also numerous other timber trees, including the valuable *sál* (Shorea robusta) and the rubber tree (Ficus elastica); but on the whole the Khásí Hills are remarkable for the
[648] absence of forest. Early in 1874-75 measures were taken to put a stop to the indiscriminate burning of the forests, and the Siems and
[659] village officers were made responsible for the conservancy of the sacred groves. These endeavours have met with some success; but it is a very difficult thing to change the habits of a population, or to induce uncivilised tribes to incur a small temporary inconvenience for the sake of future benefit. The total area directly protected from fire during the year 1875-76 is returned at 3618 acres; the expenditure was Rs. 122; and in ten prosecutions for breaches of forest rules, twenty-three persons were convicted.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

(8) Cotton is grown on high lands and
248 slopes; it is sown in April, and becomes fit for picking by January.

311 AREA AND OUT-TURN OF CROPS.—According to the Assam Ad-
241 ministration Report for 1875-76, the area of the British portion of
648 the Khásí and Jáintiá Hills District amounts to 2160 square miles, of which only 110 are under cultivation; of the remainder, 1337 square miles are set down as cultivable, and 713 as uncultivable. The total area of the semi-independent Khásí States is given as 3997 square miles, of which 176 are under cultivation, 2561 are cultivable, and 1260 uncultivable. In another portion of the same Report, the area under various crops throughout the entire District is thus approximately estimated:—Rice, 59,880 acres; other food grains, 57,820 acres; cotton, 1076 acres; potatoes, 33,880 acres. The average out-turn of rice per acre is returned at 8 *maunds*, or nearly 6 cwt.; of other food grains, 3 *maunds*, or over 2 cwt.; of cotton, 2 *maunds*, or 1½ cwt.; of
[435] potatoes, 55 *maunds*, or nearly 40 cwt. The price of rice in 1875-76 was Rs. 4. 8 per *maund*, or 12s. 8d. a cwt., which gives Rs. 36 or £3. 12s. as the value of the rice crop obtained from one acre.

241 CONDITION OF THE PEASANTRY.—The Khásiás can scarcely be
423 considered an agricultural people, as they do not grow sufficient
433 grain for their own subsistence, and are dependent to a great extent on imports of rice from the neighbouring Districts. Ten acres is generally considered a comfortable holding for a husbandman in the position of an ordinary Bengal peasant, but scarcely any man in the Hills depends entirely upon the produce of his land for
[231] his support. In the Jáintiá Hills a cultivator's position is con-
[554] sidered to be very low if he possesses no cattle, but performs all the operations of agriculture with his own hands. In that portion of the District, five acres is all that can be cultivated with a single
[465] pair of oxen, the average being four acres. A husbandman with a holding of five acres would not be so well off as a retail shopkeeper, nor would it enable him to live as comfortably as he could on a money wage of Rs. 8 or 16s. a month. The peasantry, however, as a class are not in debt. The land is owned chiefly by small proprietors, who occupy and cultivate their hereditary fields. The relations of landlord and tenant do not exist in the Hills, and no rent is payable to any one; consequently the principle of Act x. of 1859 (the Rent Law of Bengal) has no application.

231 THE ANIMALS used in agriculture are oxen; goats and pigs are
435

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

reared either for food or as articles of trade. A pair of ploughing oxen are worth about Rs. 32, or £3, 4s.; an ordinary cow, Rs. 12, or £1, 4s.; a score of kids six months old, Rs. 16, or £1, 12s.; and a score of full-grown pigs, from Rs. 100 to Rs. 160, or from £10 to £16. 231 435

THE AGRICULTURAL IMPLEMENTS in use in the District consist of a plough, called *ka-jing-hir* in Khási, and a hoe or *kodáli*, called *u-mo-khiw*. When the cultivation is carried on by means of oxen, the plough is used, the hoe alone being used when the land is cultivated by manual labour. In the Khási Hills the use of the plough, except in a few rare cases, is entirely unknown; but in the Jáintiá Hills, oxen and ploughs are used to a greater extent. What is technically termed 'a plough' of land is equivalent to four English acres; a pair of oxen, together with the necessary implements, would represent a capital of about Rs. 40, or £4. 241 407 [435]

WAGES.—The Deputy-Commissioner reports that the price of labour in the District has more than doubled in the last ten years. The rates obtaining at present are from eightpence to one shilling a day for an ordinary labourer, and from one shilling to eighteenpence a day for a porter. An agricultural day-labourer earns sixpence, and a woman at the same work fourpence-halfpenny a day. Bricklayers, carpenters, and blacksmiths earn from a shilling to eighteenpence a day. The new Station of Shillong, the present seat of the Local Government, was established in May 1864, and since that date the demand for labour has markedly increased. The extension of the cultivation of potatoes has also had an appreciable effect on the price of labour. 178 464 465 [244]

PRICES OF FOOD GRAINS.—Of the different descriptions of rice in the markets of the District, the better sorts are imported from the neighbouring Districts of Sylhet and Kámrúp. The local produce is considered fit only for the use of the Khásiás. The price of the better descriptions depends entirely upon the distance from which the supplies come. In a distant market like that of Shillong, rice of the best quality generally sells at from 6 to 7 *sers* for the rupee, or from 16s. to 18s. 8d. per cwt.; and rice of inferior quality, which is only used by the poorer classes, at from 9 to 10 *sers* for the rupee, or from 11s. 2d. to 12s. 5d. per cwt. Little or no trade is carried on in unhusked grain. Paddy produced in the District generally sells at an average of from 15 to 16 *sers* per rupee, or from 7s. to 7s. 6d. per cwt. Indian corn, which is only grown to a small extent, is sold 435 439 243

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

extent of waste land, some is cultivated in a manner resembling the *júm* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *júmiá* tenure. Any renting of land is exceptional, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

MANURE is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 2s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 243 244 [435]

IRRIGATION for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

MODEL FARM.—The Shillong Model Farm, established in 1873, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red rosebs' and 'pheasant's eye'—were successfully introduced in 1873-74; but these are not looked upon favourably by the Khásiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unfitness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1744 177 244 648 654 177 245 648 654 [134] [136] 231

648
654

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

231 (£174, 8s.) was expended on the purchase of stock, including
648 cattle, sheep, and pigs from England. Even native cattle at the
elevation of Shillong fall off very much in the months of January
654 and February from want of forage, and the Khásiás at this season
generally drive them to lower slopes. But one of the chief objects
in keeping cattle at the farm was to obtain manure; and *mati kalái*
(Phaseolus radiatus) was grown for them, cut green, and stocked
[731] for food. On this they did very well. In 1875-76, however, cattle
disease broke out on the farm in a very virulent shape. Out of 39
cattle attacked, only 7, or 18 per cent., recovered, and the animals
imported from England all died. There was also a heavy mortality
in that year among the sheep and pigs. The following are the
financial results for the two years:—1874-75—Expenditure, Rs.
13,297. 0. 5; receipts, Rs. 309. 2. 6: deficit, Rs. 12,987. 13. 11.
1875-76—Expenditure, Rs. 11,445. 8. 6; receipts, Rs. 1036. 15. 0:
deficit, Rs. 10,408. 9. 6. Total deficit, Rs. 23,396. 7. 5, or £2339.
648 13s. In view of these figures the Chief Commissioner has deter-
mined to restrict farming operations to small experiments in irri-
654 gated *rabi* crops, and, as a measure of economy, to dispense with
the services of the superintendent. The future expenditure on the
farm will be insignificant. The establishment now (1877) consists
of a *sardár* on Rs. 50 and a *chaukidár* on Rs. 10 a month (total,
£72 a year), under the direct control of the Deputy-Conservator of
Forests; the total number of live-stock is 64 head.

731 NATURAL CALAMITIES, such as blights, floods, or droughts, are
not common in the District, although the crops in the Jáintiá Hills
sometimes suffer from insects. So far as the Deputy-Commissioner
is able to ascertain, no destruction of crops affecting the general
harvest has occurred within the experience of the present generation.
[435] During the Orissa famine of 1866-67 the maximum price of common
rice reached £1 per hundredweight, but no such distress was felt as
to require Government relief operations. The price just mentioned
was certainly equal to the rates prevalent in the famine-stricken
localities; but prices always rule high in the Hills, and afford no just
criterion of the state of affairs among the general body of the
inhabitants. Distress was only felt by a small portion of the
population, chiefly the Bengáli immigrants residing in the District,
262 who are generally a well-to-do class. The Hill people, as a rule, do
244 not eat potatoes, which they grow only for export; but in case of
439 actual famine, they might fall back upon this crop for their own food
Supply.

headquarters of the Administration. The manufacture of country spirit gives employment to a considerable number of persons, most of whom are females. At a recent census of the country stills in the district, undertaken by the district officials, the number of stills has been found to be 1,530. There must be at least one person employed at each still, so that the number of distillers is probably not less than 2,000, possibly more. The spirit is distilled both for home consumption and for purposes of sale, in some villages almost entirely for sale. In the Jaintia Hills stock-breeding and dealing in cattle provides occupation for 1,295 people, according to the last census. The cattle are reared in the Jaintia Hills and are driven down to the plains when they reach the age of maturity, where they find a ready market amongst the Sylhetis. Cattle are also driven into Shillong for sale from the Jaintia Hills. Another place for rearing cattle is the Siemship of Nongkhlaw, where there is good pasturage in the neighbourhood of Mairang. These cattle are either sold in Shillong or find their way to the Kamrup district by the old Nongkhlaw road. Cattle-breeding is an industry which is capable of expansion in these hills. There are a few carpenters to be found in Shillong and its neighbourhood. The Khasis are said by Col. Waddell to be unacquainted with the art of weaving; but the fact that a considerable weaving industry exists amongst the Khyrwang villages of the Syntengs, and at Myuso and Sohtings, has been overlooked by him. The Khyrwangs weave a special pattern of cotton and silk cloth, striped red and white. In Myuso and Sohtings similar cloths are woven, also the sleeveless coat. In former days this industry is said to have been considerable, but it has been displaced to a large extent of late years by Manchester piece goods. The number of weavers returned at the last census in the district was 533. The Khasis and Mikirs of the low country, or Bhoia as they are called, weave cotton cloths which they dye with the leaves of a plant called u soh. This is perhaps the wild indigo, or ram, of the Shan settlers in the Assam Valley. The weavers are almost always females. An important means of subsistence is road and building work; a considerable number of coolies, both male and female, are employed under Government, practically throughout the year, in

more and chemical fertilizers. Both level land and 241
hillsides are cultivated by the same hand techniques. 1 × 6-foot patches are fashioned with walkways between, soils are overturned within the patches and allowed to dry, the soils are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sown with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double
crop as well. Paddy has long been found in the 243
lowlands, in parts of Jaintia and Khasi, the only 199
places where the plow is found. Nowadays paddy is 171
more and more seen in the uplands, together with a simple terracing and irrigation technology. Many
upland Khasis have house gardens in which they 244
raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Khasi country 241
are paddy rice, tea, cucurbitacea, cotton, bananas, and 189
pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fish- 226
ing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, 224
including spring guns and pitfalls, but was always primarily a sport. [Cf. Stagmüller 1928.] **Gathering.** 222
Khasis once gathered about 100 species of wild plants, most of them for food, but some for medicine. Thirty villagers still gather food plants, but there is [278]
no real dependence on gathering. Medicinal plants
continue to be very important. **Domestic animals.** 231
Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is [230]
now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage [233]
freely in the fields during the winter, but are herded by a commonly hired herdsman during the agricultural season. Most households keep chickens, gen- [235]
erally for their eggs, and a few keep ducks. A few horses are also seen. Dogs are partials, except for hunting dogs. Cats are popular. **Food and stimulants.** 262
The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the 264
morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods 262
are taken to certain site. Stimulants are extremely 189
common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also 276
smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, 275
where distilled rice whisky is cooked and sold by the 276
glass and by the bottle. Imported opium had spread widely in the midnineteenth Khasi country, but controls 276
instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and 177

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

There is considerable trade carried on in
845 *tejpát* or bay leaves, the trees being extensively cultivated by the
439 inhabitants of the lower slopes of the hills on the Sylhet border. The finest oranges in India are also grown in groves in the same tract, the value of the trade in which is now (1876) estimated to amount
237 to £3760 per annum. Lac is gathered by the Mikírs in the Jáintiá
499 Hills, but not to any great extent. Bees are both domesticated
231 and found wild, and an extensive trade in bees-wax is carried on, the amount exported being estimated at from three hundred to four hundred *maunds* annually. The whole of the Hills, where there is
233 no forest, and where the land is not under cultivation, consists of
621 rich pasture grounds, which are held in common by the villagers
651 and pay no revenue to Government.

137 The forests of the Khási and Jáintiá Hills do not yield much profit either to the British Government or to the chiefs. There
[648] are no reserved forests in the District; and according to the Deputy-Conservator, the total area of unreserved forest, *i.e.* of land covered
[659] with timber trees and not at present required for *jhúm* cultivation, is only 150 square miles. The trees found are chiefly pine, and those classified as 'mixed upper hill forests.' At an elevation of 3000 feet, the Pinus Kasia predominates over all other vegetation and forms almost pure pine forests. It is found also at lower heights, and there attains larger dimensions, but only in the case of isolated trees. The 'mixed upper hill forests' are confined to a series of sacred groves, which clothe the topmost ridge of the watershed between the valleys of the Brahmaputra and Surmá. The characteristic trees are those of a temperate vegetation, chiefly consisting of oaks, chestnuts, magnolia, Schima, Cinnamomum, Prunus, Engelhardtia, etc. There are also numerous other timber trees, including the valuable *sál* (Shorea robusta) and the rubber tree (Ficus elastica); but on the whole the Khási Hills are remarkable for the
[648] absence of forest. Early in 1874-75 measures were taken to put a
[659] stop to the indiscriminate burning of the forests, and the Siems and village officers were made responsible for the conservancy of the sacred groves. These endeavours have met with some success; but it is a very difficult thing to change the habits of a population, or to induce uncivilised tribes to incur a small temporary inconvenience for the sake of future benefit. The total area directly protected from fire during the year 1875-76 is returned at 3618 acres; the expenditure was Rs. 122; and in ten prosecutions for breaches of forest rules, twenty-three persons were convicted.

[illegible]

rice and chemical fertilizers. Both level land and 241
terraces are cultivated by the same hand techniques.
[illegible] Silver patches are fashioned with walkways between
them, seeds are overturned within the patches and
allowed to dry, the seeds are burned slowly and the
ashes spread over the soil, and finally the seed is
sown, either broadcast or sown with the aid of the
typical Khasi hoe. The subject part of the upland
[illegible] a terracing crop, and Khasis often double
crop as well. Polity has long been found in the 243
highlands, in parts of Jaintia and Khasi, the only 180
places where the plow is found. Nowadays paddy is 171
more and more seen in the uplands, together with
a simple terracing and irrigation technology. Many
upland Khasis have home gardens in which they 244
raise a wide variety of vegetables, including pumpkins,
cabbage, radishes, sweet potatoes, eggplant,
and many others. Important crops in Khasi country 241
are paddy rice, tea, cucumbers, oranges, bananas, and 189
pineapples, in War, they are betel nut, jute leaf,
mangos, and sugar cane. **Fishing and hunting.** Fishing 226
is done by poisoning streams, but this is a sub-
sistence activity only in the southern foothills. Hunting 224
was formerly by bow and arrow or by traps,
including spring guns and pitfalls, but was always
primarily a sport. (2. Stagmiller 1968) **Gathering.** 222
Khasis once gathered about 150 species of wild
plants, most of them for food, but some for medicine.
Thirty villagers still gather food plants, but there is [270]
no real dependence on gathering. Medicinal plants
continue to be very important. Domestic animals 231
Fowl, goats, pigs, and cattle are bred both for meat
and sacrifice. Silk was formerly not utilized, but is [1.36]
now so popular that specialists keep herds of which
cows. Pigs are used as village scavengers, but some
also receive prepared food. Cattle and goats forage [1.35]
freely in the fields during the winter, but are herded
by a commonly hired herdsman during the agri-
cultural season. Most households keep chickens, pri- [1.35]
marily for their eggs, and a few keep ducks. A few
horses are also seen. Dogs are variable, except for
hunting dogs. Cats are popular. **Food and stimulants.** 262
The staple food of Khasis is boiled rice, together with
the dried fish which is imported from Sylhet. Boiled
beef, pork, and chicken are relished, but beyond the
means of most. Meals are taken twice a day, in the 264
morning and evening, although lunches also take place
and cold sweet potatoes or rice bread. Certain foods 263
are taboo to certain clans. Stimulants are extremely 180
common, especially betel nut, which is often ac-
companied by a bit of tobacco. Tobacco is also 276
smoked as cigarettes and in hookah and other pipes.
Every village has one or more household taverns, 275
where distilled rice whisky is cooked and sold by the 275
glass and by the bottle. Imported opium had spread 276
widely in the malarious Khasi country, but controls
instituted in the 1880s have been fairly successful. 276
All stimulants were once taboo to men, women, and 177

of anything except iron or steel, the result being that the sword is most awkward to hold, and could never have been of much use as a weapon of offence.

The same spear is used for thrusting and casting. The spear is not decorated with wool or hair like the spears of the Naga tribes, but it is nevertheless a serviceable weapon, and would be formidable in the hand of a resolute man at close quarters. The length of the spear is about 6½ feet. The shaft is generally of bamboo, although sometimes of ordinary wood. The spear heads are forged in the local smithies.

The Khasi weapon *par excellence* is the bow. Although no "Robin Hoods," the Khasis are very fair archers, and they use the bow largely for hunting. The Khasi bow (*ka synriah*) is of bamboo, and is about 5 feet in height. The longest bow in use is said to be about the height of a man, the average height amongst the Khasis being about about 5 feet 2 inches to 5 feet 6 inches. The bowstring is of split bamboo, the bamboos that are used being a *synt*, a *ishiew*, and a *sing-lisi*.

The arrows (*ki khnam*) are of two kinds: (a) the barbed-headed (*ki pilong*), and (b) the plain-headed (*ong*). Both are made out of bamboo. The first kind is used for hunting, the latter for archery matches only. Archery may be styled the Khasi national game. A description of Khasi archery will be found under the heading "Games." The feathers of the following birds are used for arrows:—Vultures, geese, cranes, cormorants, and hornbills. Arrow-heads are made of iron or steel, and are forged locally. The distance a Khasi arrow will carry, shot from the ordinary bow by a man of medium strength, is 150 to 200 yards. The Khasi shield is circular in shape, of hide, and studded with brass or silver. In former days shields of rhinoceros hide are said to have been used, but nowadays buffalo skin is used. The shields would stop an arrow or turn aside a spear or sword thrust. The present-day shield is used merely for purposes of display.

Before the advent of the British into the hills the Khasis are said to have been acquainted with the art of manufacturing gunpowder, which was prepared in the neighbourhood of Mawsynram, Kyrdi and Cherra. The gunpowder used to be

such a way that the notch can be cut directly after a knot. The purpose of the notch is to be able to set the arrow easily on the string. There are two kinds of notches: 411

1. Notches which resemble the curve of a Moorish bow. (14)

14. Illustration II, figs. 5a, 5b.

2. Notches which have an even flatness at the bottom and a point on the left and the right. (15)

15. Illustration II, figs. 6a, 6b.

Relationship of the Cut Surface to the Notch.

The large spear-shaped tips of the hunting arrows ('nam-pliang) are made with the wide flat part at right angles to the notch and thus to the string of the bow. (16)

16. Bruno Adler, op. cit., p. 607.

Markings on the Arrows.

[617] Many arrows (arrows for sport 'nam-sop) are marked with black lacquer from the end of the base of the feathering to the notch, so that the arrows of the teams can be told apart in shooting competitions. (17) [526]

17. Illustration II, fig. 6a.

Feathering the Arrows

411
237

The Khasi have two ways of feathering:
1. Radial sewn feathering.
2. Tangential tied feathering.

411 237 Ad 1. Radial sewn feathering is the common method. Feathers are taken from geese, cranes, cormorants, Buluwar vultures and the horn bird. The feathers of the carrion vultures are used less often as they are brittle. The feathers are split along the quill (shaft), cut on the top and on the bottom and sewn onto the base. At one end the feathers are 4 millimeters wide, on the other end (towards the notch) 8 millimeters wide. The split quill is 5 centimeters, the outer flags of the feathers 7 to 8 centimeters.

411 237 531 The base consists of tinfoil and is divided variously. A strip of tinfoil (not colored) alternates with a strip of tinfoil colored red. Thus the bases have a red tinfoil strip in the middle and two red ones at each end. Or there are three in the middle and at the ends two or three red strips of tinfoil. The space in between is filled out with uncolored tinfoil (silver). The red strips of tinfoil are two millimeters wide. (18)

18. Illustration II, fig. 6a.

There are also bases of leather which is cut very fine and gilded. As in the examples just mentioned red strips of tinfoil alternate with the base that is not colored; similarly, uncolored strips of leather alternate with the gilded base. The uncolored strips of leather are 7 millimeters wide. (19)

19. Illustration II, fig. 7a.

The feathers which have been cut properly are now sewn onto the bases with uncolored natural silk, in a spiral form, (20), although

20. Illustration II, fig. 4

lightly. The stitches are made exactly and evenly throughout. Figures 7b and 8b of illustration II, though greatly enlarged show how the silken threads are put on. With a base 5 centimeters long the number of stitches is 22 to 24, with bases of 7.5 the number of stitches is 29 to 31. 411 237 531

The feathers are at right angles to the split quill on the shaft and are sewn on five together, more rarely three together.

On the underside of the base (towards the tip of the arrow) black colored pitch is smeared, to unite the cut off feather ends to the shaft of the arrow. (21)

21. Illustration II, figs. 7a, 8a.

[011] Ad. 2. Tied tangential feathering is only used still on children's arrows ('nam-phiah). A completely uncut feather is fastened lengthwise on the end of the arrow by silk or bast and the join is smeared with pitch. 411 237

Hunting arrows and arrows for sport are also used unfeathered (hunting arrows especially in the neighborhood of Lamin) and are then simply called 'nam, but if they are feathered they are called 'nam-pur. 411 526

The target is made of the soft wood of a root and is called ka sob-pdung by the Khasi. A piece of wood about 8 to 10 centimeters wide and 50 centimeters long is cut from the root, smoothed on the front side and pointed somewhat towards the ground, so that the whole thing resembles a relatively wide but short lath. This target is set up by putting the somewhat pointed end into the earth and placing two bamboo sticks behind as braces, so that the target cannot be tipped

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

There is considerable trade carried on in
845 *tejpát* or bay leaves, the trees being extensively cultivated by the
439 inhabitants of the lower slopes of the hills on the Sylhet border. The
finest oranges in India are also grown in groves in the same tract,
the value of the trade in which is now (1876) estimated to amount
• 237 to £3760 per annum. Lac is gathered by the Mikirs in the Jáintiá
439 Hills, but not to any great extent. Bees are both domesticated
and found wild, and an extensive trade in bees-wax is carried on,
231 the amount exported being estimated at from three hundred to four
hundred *maunds* annually. The whole of the Hills, where there is
233 no forest, and where the land is not under cultivation, consists of
621 rich pasture grounds, which are held in common by the villagers
651 and pay no revenue to Government.

137 The forests of the Khási and Jáintiá Hills do not yield much
profit either to the British Government or to the chiefs. There
[648] are no reserved forests in the District; and according to the Deputy-
Conservator, the total area of unreserved forest, *i.e.* of land covered
[659] with timber trees and not at present required for *jhúm* cultivation, is
only 150 square miles. The trees found are chiefly pine, and those
classified as 'mixed upper hill forests.' At an elevation of 3000
feet, the Pinus Kasia predominates over all other vegetation and
forms almost pure pine forests. It is found also at lower heights,
and there attains larger dimensions, but only in the case of isolated
trees. The 'mixed upper hill forests' are confined to a series of
sacred groves, which clothe the topmost ridge of the watershed
between the valleys of the Brahmaputra and Surmá. The characteristic trees are those of a temperate vegetation, chiefly consisting of
oaks, chestnuts, magnolia, Schima, Cinnamomum, Prunus, Engelhardtia, etc. There are also numerous other timber trees, including
the valuable *sál* (Shorea robusta) and the rubber tree (Ficus
elastica); but on the whole the Khási Hills are remarkable for the
[648] paucity of forest. Early in 1874-75 measures were taken to put a
[659] stop to the indiscriminate burning of the forests, and the Siems and
village officers were made responsible for the conservancy of the
sacred groves. These endeavours have met with some success;
but it is a very difficult thing to change the habits of a population,
or to induce uncivilised tribes to incur a small temporary inconvenience for the sake of future benefit. The total area directly
protected from fire during the year 1875-76 is returned at 3608
acres; the expenditure was Rs. 122; and in ten prosecutions for
breaches of forest rules, twenty-three persons were convicted.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

133 the highest point is the Shillong Peak, 6,445 feet, covered with scrub,
137 grassland and forests (mostly oak, rhododendron and pine trees). The Jaintia Hills are considerably lower, with much flat land; wet paddy cultivation is practised here and there where sufficient water is available. From the plateau of the Khasi Hills northwards to the Assam Brahmaputra Valley there is a gentle slope covered with thick jungle, and the southern slope towards the Bengal plain is very steep, so that

101
102
619

MAP. 6. — *Map of the Khasi-Jaintia Hills with Classification of Groups.*

139 the upland remained practically cut off from the plains until the
137 middle of the 19th century.

Following the geographical and ecological differences, the five
619 groups are segregated into fairly well-defined cultural areas, each
[181] developing a different economy and dialect:

[24]

1. The Jaintia[1] — associated mostly with wet rice cultivation.
2. The Khasi (upland Khasi) — practise potato cultivation with small-scale rice and maize cultivation.
3. The War — inhabit the southern slope of the Khasi and Jaintia Hills (they are called geographically the Khasi War and the Jaintia War). Due to the heavy rainfall, the soil is the most fertile in the Khasi and Jaintia Hills. The Khasi War practise jhooming of which the main yield is millet. In the lower part of this area, pan-leaf, betel-nut, and orange gardens are cultivated. The Jaintia War practise wet rice cultivation like most of the Jaintias, as well as pan-leaf cultivation.

1. They are called also the Syntong or the Pnar.

Upto now the main sources of forest revenue in the district are timber, limestone, lac, bay leaf and elephants. 13

2.6 **Agriculture.**—The greater proportion of population of the district subsist on agriculture. The staple crops raised in the district are wet and dry rice, various kinds of millets, maize, potatoes, pineapples, oranges, arecanut, betel-leaf and bay leaf. To a smaller extent they grow in the gardens round their houses vegetables, pulses and occasionally sugarcane. 24

2.6.1 **The main crops : Rice.**—While wet rice is grown in the valleys with which the hills are interspersed, dry rice is grown on the hill sides. Highland rice is seldom grown twice running on the same spot for after one crop the soil is exhausted and a fallow period of four to five years is usually allowed. Jowai subdivision is predominantly a wet rice producing area. In Shillong subdivision main wet rice pockets are the Bhoi area stretching upto the sung valley and the southern portion of the plateau, the Mylliem state, the south-western portion of the district and the southern plain portion of the district adjoining East Pakistan. Dry rice is grown more or less through out the district. While Jowai subdivision can claim self sufficiency in rice, Shillong subdivision is a deficit area and the people in this subdivision particularly those in the southern portion (border area) of the district have to depend on supplies from outside. Though there is no reliable statistics on the area under rice, a rough estimate is given elsewhere in the land utilisation table. 243

Maize and millet.—Are two important food crops of the district grown more or less throughout the district.

Potatoes are extensively grown in the higher slopes and in the lower land which are well drained. Generally two crops of potatoes are raised annually in the district. In respect of production and export of potato this district occupies the topmost position in the State of Assam. 244

Oranges, betel leaf and arecanut are most extensively grown in the southern foot of the hills, i.e. all over the border areas. Oranges are also grown in Borsihat area, in the northern portion of the district. Orange and lemon plantations extend from the foot of the hills to a height of about 1100 feet and are carried up the roadsides which mark the southern face of the high plateau. The district is an important producer of Bay-leaf which is abundantly found in the border areas of the district. Other valuable cash crops of the district are black pepper, turmeric, chillies, ginger, pineapple and various other fruits. 245

2.6.2 **Agricultural seasons.**—For wet rice, the lands which are naturally irrigated by virtue of their very location, are ploughed or hoed by about the middle of February and seed sown in May or June. Harvesting takes place in October and November. For dry rice, the land is hoed by about the middle of September, the solids are collected into little heaps and burnt and by February the land is again hoed up and the seed sown in April - May. Harvesting goes 243

426 Of the total number of loans 81 per cent in Border area, 18 per cent in Project area and 29 per cent in General area were free of interest while rate of interest for 9 per cent, 30 per cent and 60 per cent respectively of the loans in the three areas were found to be 30 per cent or more per annum which in cases ranged upto 200 per cent.

241 434 592 10.8. Farm output of 67 per cent of the families in Border area, 56 per cent of families in Project area and 60 per cent of families in General area were less than Rs. 500. a year, while 8 per cent, 30 per cent and 1 per cent of the families in the respective area earned more than Rs. 2,000.00 a year from their farms. Of the total number of farms fetching less than or Rs. 500.00 a year in Border area 33 per cent of them are medium sized farms and 4 per cent large sized farms, the corresponding proportions for Project area and General area being 21 per cent, 1 per cent, 27 per cent and 1 per cent.

24 433 10.9. In Border area the most important crops are oranges, betelnut, paddy, and betel leaf which respectively accounted for 31 per cent, 27 per cent, 19 per cent and 9 per cent of the total harvested area. In Project area paddy and orange are the most important crop which accounted respectively for 32 per cent and 3 per cent of the total harvested area. The most important crops in the General area are paddy and potato which respectively accounted for 61 per cent and 7 per cent of the total harvested area.

On the basis of data collected for all the villages investigated average yield per acre worked out at paddy 11.65 maunds, potato 21.61 maunds, oranges 3.77 lacs (3000 numbers) and betelnut 2.95 lacs (12000 numbers). These yield exhibited wide variation among the three areas.

434 592 10.10. Proportions of families with annual gross income of less than Rs. 750, Rs. 750 to less than Rs. 2,000, and above Rs. 3,000, were respectively found to be 40 per cent, 45 per cent and 6 per cent in Border area, 34 per cent, 60 per cent and 6 per cent in Project area and 45 per cent, 50 per cent and 5 per cent in General area. Average annual gross income per family worked out at Rs. 1,070.30 in Border area, Rs. 1,030.40 nP. in Project area and Rs. 860.36 nP. in General area which for predominantly agricultural and non-agricultural families respectively stood at Rs. 1,033.06 nP. and Rs. 1,161.91 nP. in Border area, Rs. 1,005.33 nP. and 1,040.36 nP. in Project area and Rs. 875.08 nP. and 700.05 nP. in General area. In all the three areas main contributors to family income were agriculture, service-professions-labour and trade accounting respectively for 44 per cent, 33 per cent and 15 per cent of the total average income in Border area, 37 per cent, 40 per cent and 9 per cent in Project area and 53 per cent, 36 per cent and 8 per cent in General area.

The net annual income per family in different income groups varied between Rs. 60 to 1,040 in Border area, between Rs. 110 to Rs. 1,500 in Project area and between Rs. 98 to Rs. 2,004 in General area. The average over all per family net annual income working out at Rs. 601 in Border area, Rs. 705 in project area and Rs. 760 in General area and the same per capita at Rs. 231 in Border area, Rs. 216 in Project area and Rs. 253 in General area.

[p. 24]

SECTION II.

OCCUPATION.

24/ The greater proportion of the population subsists by cultiva-
465 tion. Cultivation of rice may be divided under two headings,
[62] high land or dry cultivation and low land or wet cultivation.
The total number of persons who subsist by agriculture
generally in the hills, is given in the last Census Report as
154,907, but the term agriculture includes the cultivation of
the potato, the orange, betel-nut and *pân*. A full description
of the different forms of agriculture will be given under the
463 heading "Agriculture." A considerable number of Khasis earn
482 their livelihood as porters, carrying potatoes to the markets on
437 the Sylhet side of the district, from whence the crop is conveyed
by means of country boats to the different places of call of
river-steamers in the Surma Valley, the steamers carrying the
potatoes to Calcutta. Potatoes are also largely carried to
Shillong by porters, where the tuber is readily bought by
Marwari merchants, who load it in carts to be conveyed by
road to Gauhati, from which station it is again shipped to
482 Calcutta and Upper Assam. Many persons are also employed in
485 carrying rice up the hill from Theria to Cherrapunji, Shillong,
[64] and on to other places. Salt is also carried by porters by
this route. Many Khasis, both male and female, live by daily
labour in this way, earning as much as eight annas, and
[62] six annas a day, respectively. The Census Report of
1901 shows some 14,000 "general labourers" in the district,
the greater number of whom are porters and coolies, both male
[55] and female, employed on road work and on building. In
Shillong the Government Offices and the printing press give
employment to a certain number of Khasis. There is also a fair
demand for Khasi domestic servants, both among the Europeans
and the Bengali and Assamese clerks who are employed at the
headquarters of the Administration.

this season, the males earning on an average 8 annas and the females 4 annas a day. Col. Dixon writes that in 1873 the wages for ordinary male labourers were 4 to 6 annas a day, and for females 2½ to 4 annas, so that the wages rates have almost doubled in the last thirty years. Contractors, however, often manage to obtain daily labour at lower rates than those paid by Government. Sonnamons and skilled labourers are able to get higher rates. It is easier to obtain coolies in the Khasi Hills than in the Jaintia Hills, where a large proportion of the population is employed in cultivation. The Khasis are excellent labourers, and cheerful and willing, but they at once resent bad treatment, and are then intractable and hard to manage. Khasis are averse to working in the plains in the hot-weather months.

APPLICATION.

I am indebted to Mr. Rita for the following remarks on apiculture in the Khasi and Jaintia Hills.

There are two kinds of indigenous bees in the Khasi Hills, one domesticated, called *u syng ngin Sulieu*, and the other *u Ipem*, which is never domesticated, and is very poisonous; its hives are difficult of access, being always located in very high cliffs. A few hives of a third class of bee are now a-days to be found in and around the station of Shillong, i.e. the Indian. This bee was imported into the hills by Messrs. Dobbie and Rita, and the species became propagated in the following manner. The bees had been just established in a hive, when they had constructed a brood comb, when the hive was robbed by some Khasis for the sake of the *honey* it contained, which they wished to consume as food; but the queen bee escaped and established other colonies, one of which was afterwards captured by Mr. Rita, the others establishing themselves at places in the neighbourhood. The hive used by the Khasis is of a very primitive description. It is usually a hollow piece of wood, about 2½ to 3 ft. in length and 10 or 12 in. in diameter. A small door is placed at each end of the log, one for the bees to go in and out, and the other for the removal of the honey when wanted. The honey-combs are broken and the honey is

played with a little wooden bar held in the hand. *Ka marpu* is an instrument much the same as the last, but is played with a bow like a violin. *Ka marpdhia* is a kind of guitar with one string, played with the fingers.

Ka tingpuri is a wooden pipe, which is played like a flageolet. *Ka lyndhia*, or *shibawiar*, are cymbals made of bell metal; *ka shiwiti*, or *ka shingpiang*, is a kind of flute made of bamboo. This instrument is played at communion ceremonies, and when the bones and ashes of a clan are collected and placed in the family tomb, or *mawbah*. This flute is not played on ordinary occasions. In the folk-lore portion of the Monograph will be found a tale regarding it. There are other kinds of flutes which are played on ordinary occasions. The Wars of the twenty-five villages in the Khyrim State make a sort of harp out of reed, which is called *ka 'ning diny phang*. The Khasis also play a *jowai* harp (*ka mang*), which is made of bamboo.

AGRICULTURE.

The Khasis are industrious cultivators, although they are behindhand in some of their methods of cultivation, (e.g. their failure to adopt the use of the plough in the greater portion of the District); they are thoroughly aware of the use of manures. Their system of burning the soil, allowing them to dry, then burning them, and raking the ashes over the soil, is much in advance of any system of natural manuring to be seen elsewhere in the Province. The Khasis use the following agricultural implements:—A large hoe (*mukhia hok*), an axe for felling trees (*ka sifai*), a large *da* for felling trees (*ka ward lyngpem*), two kinds of bill-hooks (*ka wahi pnat* and *ka wahi thmat*), a sickle (*ka ...hi*), a plough in parts of the Jaintia Hills (*ka lyngkor*), also a harrow (*ka ...ni ...*). In dealing with agriculture, the lands of the Khasi and Jaintia Hills may be divided into the following classes:—(a) Forest land, (b) wet paddy land called *hali* or *pynthor*, (c) high grass land or *ka ri lum* or *ka ri pilang*, (d) homestead land (*ka 'dew lyngki*). Forest lands are cleared by the process known as *jhuming*, the trees being felled early in the winter and allowed to lie till January or February.

I:Gurdon E-4, 5 (no date) 1907 AR? Khasi AR?

when fire is applied, logs of wood being placed at intervals of a few feet to prevent as far as possible the ashes being blown away by the wind. The lands are not hoed, nor treated any further, paddy and millet being sown broadcast, and the seeds of root crops, as well as of maize and Job's tears, being dibbled into the ground by means of small hoes. No manure, beyond the wood ashes above mentioned, is used on this class of land; there is no irrigation, and no other system of watering is resorted to. The seeds are sown generally when the first rain falls. This style of cultivation, or *jhum*, is largely resorted to by the people inhabiting the eastern and southern portions of the Jaintia Hills, e.g. the Bhoi and Lalungs, the Lyngngam and Garos of the western tracts of the district. Wet paddy land (*hali* or *pynthor*) is, as the name implies, the land where the kind of paddy which requires a great deal of water is grown. The bottoms of valleys are divided up into little compartments by means of fairly high banks corresponding to the *kamaras* *dis*, and the water is let in at will into these compartments by means of skilfully contrived irrigation channels, sometimes a mile or more in length. The soil is made into a thick paste in the Jaintia Hills by means of the plough, and in the Khasi Hills through the agency of the hoe. Droves of cattle also are driven repeatedly over the paddy-fields until the soil has acquired the right consistency. The seed is then sown broadcast in the wet soil. It is not sown first in a seedling bed and then transplanted, as in Assam and Bengal. When the plants have grown to a height of about four inches, water is let in again; then comes the weeding, which has to be done several times. When the crop is ripe, the ears are cut with a sickle (*ka sudi*) generally, so as to leave almost the entire stalk, and are left in different parts of the field. A peculiarity about the Lyngngam and the Khasis and Bhoies of the low hills, or Bhoies as they are called, is that they reckon it easy, or taboo, to use the sickle. They reap their grain by pulling the ear through the hand. The sheaves, after they are dry, are collected and threshed out on the spot, either by beating them against a [illegible] (*shah kha*), or by men and women treading them out (*lah-kha*). Cattle are not used for treading out the grain. The grain is then collected and placed in large bamboo receptacles

ii Gibson E-4, 5 (no date) 1907 ART Khasi ART

After the plants have attained the height of about 6 in., they are earthed up. When the leaves turn yellow, it is a sign that the potatoes are ripe. The different kinds of sweet potatoes grown and the yam, and another kind of esculent root—*u sukphlang* (*Dioscorea vestita Roxb.*) will be noticed under the head of "Crops."

The Khasis possess very few agricultural sayings and proverbs, but the following may be quoted as examples:—

(1) *Wet ju ei thong jingthong ne lot synshai ka ka ewiew ka.*

Do not allow plants to be planted or seeds to be sown by one who has a bad hand.

As elsewhere, there is a belief amongst the Khasis that some people's touch as regards agriculture is unlucky.

(2) *Thong diang ka lot synshai kaba ngam bnai, pa kaba ehei u bnai.*

Plant trees or sow seeds not when the moon is waning, but when it is on the wane.

(3) *Wei ka ane kha ka bneng ngingi jaw ewiet phim ne ioh jingpeng kaba.*

A red sky in the west in the evening is the sign of fine weather to-morrow.

Cf. our English proverb "a red sky in the morning is a shepherd's warning, a red sky at night is a shepherd's delight."

CROPS.

The varieties of rice found in the Khasi Hills are divided into two basic classes, one grown as a dry crop on high lands, and the other raised in valleys and hollows which are artificially irrigated from hill streams. The lowland rice is more productive than that grown on high lands, the average per acre of the former, according to the agricultural bulletin, as ascertained from the results of 417 experimental crop cuttings carried out during the fifteen years preceding the year 1906, being 11.7 maunds of paddy per acre, as against an average of 8.4 maunds per acre (resulting from 407 cuttings made during the

The slaves and other similar sacrifices to the gods of the State or divisions of the State may be said to be the communal religious duties of the Iyngkhos. The duties of Iyngkhos with reference to private persons may now be mentioned. When it is found that any two people have made an incestuous marriage, that is to say a marriage within the exogamous group of the Iyn, or clan, the parties at fault are taken before the Iyngkhos by their elsemen, who request him to sacrifice in order to ward off the injurious effects of the sang or taboo, of such a connection from the kindreds. On this occasion a pig is sacrificed to a'lei Iyngkhos and a goat to Ka Iei Iong syi. The parties at fault are then entertained. As mentioned in another place, the sin of incest admits of no expiation for the offenders themselves. In the Khyrim State, it is said by the Iyngkhos themselves, although not by the Siem or the myntries, that they are the ceremonial heirs of all the persons who die without having female heirs (ing dak). In other States such property passes to the Siem. The Iyngkhos of Nongkhrem can also take possession of the property of persons who have been found to harbour an evil spirit (jingkhi) in their houses. It appears that in such cases the house and furniture are burnt, as in the case of the Tawk-expectation in the Jaintia Hills, the Iyngkhos, however, taking possession of jewellery or anything else of value. The only practical service the Iyngkhos renders in return is to build the affected person a new house; when, indeed, we take into account the casting forth of the devil by the Iyngkhos. Mr. Jenkins, of Shangpung, in the Jaintia Hills, writes: "Such is the belief of the people in the evil spirits, that they are completely under the influence of the priests and spend large sums of money in order to secure their favour. They live in constant dread lest, by the least transgression or omission, they should offend these overlords and so bring upon themselves the wrath of the demons." The influence of the Iyngkhos over the people in the Jaintia Hills seems to be stronger than in the Khasi Hills. For instance, it came to my notice in Balang that crops cannot be cut until the Iyngkhos has seen them, in other words, until the Iyngkhos has claimed and obtained his share of the produce. In many places, however, in the Khasi Hills the Iyngkhos is much the [illegible] [illegible] of Gorham's

This cross is apparently some rough gem which may be picked up by the Lyngams in the river beds. A rich man amongst them, however, is one who possesses a number of metal gongs, which they call *wiu-g*. For these they pay very high prices, Rs. 100 being quite a moderate sum for one of them. Being curious to see one of these gongs, I asked a *sirdar*, or head-man, to show me one. He replied that he would do so, but it would take time, as he always buried his gongs in the jungle for fear of thieves. Next morning he brought me a gong of bell metal, with carvings of animals engraved thereon. The gong when struck gave out a rich deep note like that of Burmese or Tibetan gongs. These gongs have a regular currency in this part of the hills, and represent to the Lyngams "Bank of England" notes. It would be interesting to try to ascertain what is their history, for no one in the Lyngam country makes them in these days. Is it possible that the Garos brought them with them when they migrated from Thibet? The gongs are well known in the Garo Hills, and I hear that when a *sirdar*, or head-man, dies his corpse is laid out upon them. They thus possess also an element of sanctity, besides being valuable for what they will fetch to the Garos or Lyngams. We may hope to hear more about them in Captain Playfair's account of the Garos.

The Lyngams do not tattoo. Their weapons are the large-headed Garo spear, the dao, and the shield. They do not usually carry bows and arrows, although there are some who possess them. They are by occupation cultivators. They use two kinds of hill rice, red and white, on the hill-sides. They have no wet paddy cultivation, and they do not cultivate in terraces like the Naga. They burn the jungle about February, after cutting down some of the trees and clearing away some of the debris, and then sow the paddy broadcast, without cultivating the ground in any way. They also cultivate millet and *Job's tears* in the same way. With the paddy million are sown the next year. The egg plant, yams, ginger, turmeric, and sweet potatoes of several varieties are grown by them in a similar manner. Those that sow the lac insect plant feeder trees (Hindi *ankal dal*) in the forest clearings, and rear the insect thereon. Some of these people, however, are prohibited by a

1:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

custom of their own from cultivating the *dondon*, in which case they plant certain other trees favourable to the growth of the lac insect. The villages are situated near their patches of cultivation in the forest. The villages are constantly shifting, owing to the necessity of burning fresh tracts of forest every two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the houses are raised some 3 or 4 ft. from the ground on platform, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading children and other articles to dry. Some Lyngam houses have only one room in which men, women, and children are all huddled together, the hearth being in the centre, and underneath the platform, the pigs. Well-to-do people, however, possess a sleeping room, where husband and wife sleep. A house I measured at Nongkhlaw village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a Garo custom. In some Lyngam villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the village councillors go on. These are similar to the *dolochang* or bachelors' clubhouses of the Mikirs, Garos, and Lalungs, and to the *morung* of the Nagas. This is a custom of the Thibetan Burmans called in Assam, and is not a Khasi institution. There are also high platforms, some 12 ft. or 15 ft. in height, in Lyngam villages, where the elders sit of an evening in the hot weather and take the air. Lyngam houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lyngams keep pigs, they do not seem to be so much as children as in the Khasi villages. There is little or no furniture in a Lyngam house. The Lyngam sleeps on a mat on the floor, and in cold weather covers himself with a [illegible]

(41) to take such a clan mother with the name Ka Sing Law. She has two
57b wives and five daughters, and in addition two brothers and two sisters who are all married. Also each of the five daughters and two sisters has four children. These forty-six people live with the clan mother and form the family clan of the Law. To these we also add the wives
(42) of brothers, the nephews and grandsons, but not their children. The latter have nothing to do with the family Law but belong to the family clan of their wives, live with that clan and are counted in it. Likewise neither the husband of Ka Sing Law, nor the husbands of the various daughters, sisters, nieces, and granddaughters belong here. They are all counted with their own clans, live and work with them according to Khasi custom, and only visit their wives occasionally perhaps after dark.

(43) The entire clan-family of Law is housed in 5 or 6 huts, which all
57c stand next to each other in a semicircle or are built one above the other on the slope of a hill, according to the character of the land. A
(44) garden frequently surrounds them in which maize, sweet potatoes, potato-like roots of Sub-ut and Sohow, bananas and, on the southern slopes of the Khasi Mountains, also coffee, pineapples, and other fruits are cultivated. A circle of bamboo cane that is so important for building purposes, household objects, and /156/ implements surrounds the garden and huts. This bamboo cane grows up so thick as an arm to a height of 10 or 15 meters and at the same time forms a good protection against bad weather. A wall (mawsha) of thrown-up earth encloses everything, forming an enclosed farm, prevents unimpeded access, and protects cattle and crops from the attacks and devastations of wild animals.

(45) What is considered the family property of such a clan? Primarily it is the land, the gardens, the rice fields, woods, fallow mountain
(46) and grazing lands. On the southern slopes of the Khasi Mountains there are fields for the cultivation of rape, orange groves, betel groves, plantations of betel palms and of pepper leaves which far and wide are so highly treasured for betel chewing as a means of pleasure. (1)

1. Cf. Becker, Im Heimat des Brahmaputra, *Am the River Valley of the Brahmaputra*/ (Munich, 1959), pp. 157 ff.

(47) Usually there is so much land available that the family-clan can enrich itself properly and also increase in number.

(48) According to its size and wealth a family clan also owns a
57d corresponding number of cows, oxen, horses, pigs, and goats. Neither the milk nor the flesh of the cows is used. They are kept for the

presentation of the written statement of the chieftain and the village elders that they would have no objection to it. The avaricious renter of the divine land mentioned above was despised by all.

As concerns the holy forests, which often extend picturesquely from the highest peak down the slope and are overgrown with gnarled oaks and bright colored rhododendron, no tree may be felled there; at the most, fallen wood or wood torn down by a storm or already rotten wood may be taken. The spirits of the forest, as punishing gods, will revenge every offense. Tigers and leopards, apes, bears, and snakes enjoy an undisturbed existence here. The only case in which wood may be cut in these divine woods is for the religious cremation ceremonies of the dead. It is the custom of the Khasi to set fire often to great areas in order to fertilize the ground with the ashes of grasses, trees, and shrubs without regard for the new growth of trees, and to make potato fields there for a year or two or to grow mountain rice, millet, or something similar and then to leave the field fallow again. Thus this is a clever precautionary rule, since there might otherwise be cases when there might be no wood for cremating the dead.

(Continuation follows)

/384/ Family Property and Maternal Rights
by C. Becker S.D.S., Wittsberg

Gordon says, (10) that these holy groves were formerly the property

10. The Khasis, p. 97.

of a village. That is not always so as the following case will demonstrate. I am also relating this because it gives us a deeper look into the whole customs of the clan under discussion.

Several decades ago, a Khasi who had become a Protestant, U Jawah Shai by name, was installed as a clerk with the English government official in Jowai. In order to assure his family a better living than just his meagre salary, he yearned for land. By birth from Jongphen in the War territory, he remembered that he could obtain his aim in the neighboring village Syndai from the family clan Umlong. So one day he went thither. After the customary greetings and refreshments with a water pipe and betel nut and conversation about various indifferent matters, he mentioned his desire. "I know," he said in the polite language of even these simple central men, "I know the goodness and the good name of your clan. Mamen and the elder-

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

—the *Slyngkop*, or porch, being flush with the ground. The *mawpoi*, or centre room, is approached by a flight of steps. There are no windows, except one, which is hung on one side to admit light and air,—this is called the *pongkoi*. Both Khasis and Syntengs, like other Indo-Chinese races, are much addicted to gambling, and drinking to excess is a national vice. Christianity has, through the agency of the Welsh Calvinistic Mission, gained a very striking extension, and may be said indeed to be leavening the whole nation. Schools are numerous, and are pretty well attended by girls as well as boys. The Christians, and those who have come under the influence of Christianity, have adopted a high standard of comfort, and their homes resemble English cottages more nearly than the huts with which one is familiar in India.

Agriculture.—The Khasis do not use the plough; they cultivate their fields with a peculiar-shaped hoe, or *mokthaw*. They cultivate rice in the valleys, the rice being seven broadcast and the fields irrigated after considerable labour. They also cultivate hill rice on the uplands, which they sow broadcast. The potato, which was introduced into the Khasi Hills by Mr. David Scott about the year 1831,[1] is extensively cultivated and forms one of the principal articles of export. *Job's-tears* (*Coix lachryma*), several kinds of millet, Indian-corn, the *Sohphlang* (*Flemingia rostata*), are also largely cultivated. The valleys on the southern slopes of the hills have extensive orange groves, the oranges, especially those grown in the neighbourhood of Shella, being famous for their quality. The betel, vine, and areca nut are also largely grown on the southern side of the hills and in the low valleys, these plantations being irrigated by elaborate systems of aqueducts. The leaf of the bay-tree (*Litsæa*) is collected, and is exported to the Sylhet plains. The Syntengs differ from the Khasis, in that they make use of the plough. Both Khasis and Syntengs are industrious cultivators, and they possess a certain rough and ready knowledge of the use of manure. A more detailed description of agriculture in these hills will be given in the monograph.

[1] Khasi and Jaintia Hills Administration Report for 1875-76 by Colonel Rice.

2. *Matriarchal customs and law of inheritance of property.*—The mother is the head of the house, and is both owner and the custodian of the family property so long as she lives. Males are owners of property amongst either Khasis or Syntengs except self-acquired property. On the death of the mother, in the case of the Khasis, the family property passes to the youngest daughter. According to some authorities, however, the property would in practice be divided amongst all the surviving daughters. Failing daughters, the property passes to the youngest sister, and failing a sister, to the youngest female cousin. The same

15: Nakane K-5 (1955-1956) 1967 AR7 Khasi AR7

197 198 244 Besides these political and religious changes, there have been very important changes in Khasi economy, particularly by the spread of potato cultivation. Potatoes were first introduced into the Hills in 1830 by Mr. David Scott. Since then, the upland Khasi Hills have been completely planted with potatoes. This grassland seems to be very easily adapted to potato cultivation, it spread so rapidly and successfully, becoming basic economy of the people, that they hardly remember life without potatoes. Information is very scanty on what was the major cultivation before the potato. However, we may surmise that they must have practiced jhum cultivation as do the present people in War and Bhoi. Nowadays, there are no jhum fields in the uplands as there are practically no forests with which to make jhum fields. There must have been a long period of jhum cultivation, which resulted in recent ecological changes in the uplands through the exploitation of the jungle. This hypothesis might be supported by the existence of big timbers in old buildings in the Khasi Hills, as well as by the present economic techniques of the people.

197 244 241 The present potato cultivation is also a kind of shifting cultivation like jhuming, with a rotation from three years to five years. The uplands are covered with grassland, and sometimes with scanty pine trees which were also introduced by the British. For potato cultivation, the Khasi first cut branches from these pine trees, and the grassland is cultivated by the small Khasi hoe. They root out grasses with earth attached about three inches in depth and one foot square. These pieces are turned onto the cultivated surface, where fallen leaves, branches and wild grass have been spread, in such a way as to keep a space between the ground and the turned up clods of earth. The field in which the potatoes are to be planted is entirely covered in this way. The grass and leaves are set on fire in one corner of the field and this fire spreads through the middle space and burns all of the grass and branches, thus converting it into excellent manure. The potatoes are planted afterwards. Two crops of potatoes are raised generally in a year. The following year the field is shifted to another grass-growing area, leaving for a few years the last field to grow another crop of grass. This is a type of small-scale jhum cultivation. This example of the present economic method suggests that the Khasi had been jhum cultivators before potatoes were introduced. It might be indicative of the last stage of jhum cultivation when the forests are completely exhausted. Before the potatoes, they must have grown yams, maize and millet more or less in the same manner. These crops are still cultivated on a small scale along with potatoes; the yield must be very low as compared with that of the War areas, obtained through the exploitation of land. In the uplands, pan culti-

I. Setting and Economic Background of Sohkynduh and Kongton

Sohkynduh and Kongton are villages of the Kadashinong[1] one of the areas under the Chorra Chief. The Kadashinong is situated on the southern slope of the Khasi Hills, in what is called War country. These two villages are situated at the farthest point from both Shella, the centre bordered by the plain, and Cherrapunjee, the seat of the Chorra Chief, one of the centres of the upland Khasi Hills. The people at Cherrapunjee say that these villages are one of the most backward parts of the Khasi Hills. They correspond to Rombagiri in the Garo Hills, as they lie in the innermost parts and more traditional economic and social settings have been preserved there than in other villages. These are also the reasons why I selected these villages as my field.

It is nine miles to Sohkynduh from Cherrapunjee, crossing two deep valleys towards the east. Kongton is located at the heart of the mountain ranges, ten miles from Cherrapunjee, towards the north-east. It is about twelve miles from Sohkynduh to Kongton, and the way leads through one of the most difficult passes, where even villagers seldom travel. In December, 1955, Sohkynduh was a community of 48 households (List 6), and Kongton of 62 households (List 9). The settlements of both villages are clustered in the southern depressions of a mountain, not far from the summit, a typical location of Khasi villages. Sohkynduh has poor soil, covered with plenty of pieces of stones. The yield therefore is very poor. On the other hand, Kongton, a much older village, enjoys fertile soil, and is one of the most prosperous communities in the Kadashinong.

The major economy of both villages is shifting cultivation. We have already seen, in the chapters on the Garo, the fundamental technique of "jhuming cultivation." The difference between the Garo and the Khasi shifting cultivation are to be found in two aspects: one is the nature of the crops and the other is the type of landownership. In this area, the main crop is millet, while that of the Garo is rice. Besides the shifting cultivation, the Khasi have pan-leaf gardens and sometimes pineapple gardens, though on a small scale and not in every household. The most important feature of Khasi shifting cultivation is the development of private ownership. In the tribal areas in Assam, such private ownership of the jhum field is quite an

1. Kadashinong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkynduh, Kymmin, Shortkynny, Shortbuit, Shortsung, Kongton, Shortiang, Kyllonsohiet, Pim, Tondum, Nongpyrung, and Dongpow. (Khasi spelling follows the customary usage in Cherra Sub.)

[P. 104 A]

group of matrilineal and War-Khasi-speaking people who claim as their ancestral homeland the primitive United Khasi-Jaintia Hills District (within approximately 90° 4' and 92° 52' E, and 25° 9' and 26° 7' N.). This group includes the Jaintias (also Pnar or Syntengi) in the southeast, who differ from the Khasis primarily in their darkened residence patterns and less virulent forms of sorcery. (The Shallow to eastern Jaintia are a Bodo people.) It also includes the Lyngngams (also spelled Lyngngam) in the west, who practice migratory swidden agriculture and certain peculiar funerary rites, and are said by Gheerbrant (1955) to be culturally intermediate between Khasis and Garos. Finally, it includes Bhoi, War, and upland Khasis, which terms are primarily territorial. Bhoi country is the north-central part of the District, and is culturally complicated by the presence of Nikiri, Lalungs, and Nepalis. War country spans the entire southern length of the District, so that War divide into Jaintia War and Khasi War, of fowl. Bhoi Khasi have traditionally transmitted property to sons as well as to daughters. The upland center of the District is the country of the Khasis proper, those whose culture provides the most useful model for interpreting the variations found elsewhere.

For general reference on all categories of Khasi culture, cf. Gurdon 1908 and 1937, also Gurdon 1907, especially for data on regional variations. Geography. The District is 5,356 square miles of hilly tableland, unevenly dissected by numerous rivers, and marked by significant ecological variation over very short distances. The tablelands step gently downward north from Shillong Peak, which at 6,445 feet is the highest point in the District, and over about 35 miles east into the Brahmaputra valley where the is some 200 feet above sea level. To the south, the land slopes more steeply downward for about 20 miles, and then drops abruptly, in cliff and steep-slope formations, to the Ganges sea-level delta that begins at its north with Sylhet. The annual southwest monsoon drop torrential rains around Cherrapunji and Nongpoh villages (for Cherrapunji, a record 905 inches in 1861), but then, reaching Shillong 35 miles to the northeast, provide only about 100 inches per year. Rainfall is again greater in Bhoi, which shares the Brahmaputra valley climate. Climate is temperate on the high Shillong plateau, where it seldom freezes and never snows. To the north, climate becomes subtropical, forest is rough, and fauna abound. The climate to the south is also subtropical. (Cf. Barker 1901, chap. XXIV.) Linguistic affiliation. Khasi is one of the many Non-Khasi languages, related to War, Khasi, Jaintia-Sylhet, Nongbah, and Pnong-Wa. The major Khasi dialects are Khasi, Jaintia, and Lyngngam, to which Gurdon adds War. Further minor variations occur from village to village. The Khasis had no script until 1841, when the roman alphabet was successfully applied to the Cherrapunji dialect of Khasi proper. (Cf. Sabel 1891, Gurdon 1907-1910, Ta Hoath 1915.)

[P. 106A] AR 7 Khasi AR 7

[illegible] and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques. 1 × 6-foot patches are fertilized with wildness leaves, soils are overturned within the patches and allowed to dry, the soils are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or soils with the aid of the typical Khasi hoe. The coldest part of the upland requires a terracing, and Khasis also dibble crop as well. Potato has long been found in the highlands, in parts of Jaintia and Bhoi, the only place where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Some upland Khasis have home gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplants, and many others. Important crops in this country are paddy rice, tea, cucumbers, cotton, bananas and pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. Fishing and hunting. Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [illegible] Gathering. Khasis once gathered about 100 species of wild plants, most of them for food, but some for medicine. Thirty villagers still gather food plants, but there is no real dependence on gathering. Wild-food plants continue to be very important. Domestic animals. Fowl, goats, pigs, and cattle are food both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milk cows. Pigs are used as village scavengers, but sometimes receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a commonly hired herdsman during the agricultural season. Most households keep chickens primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are partially, except for hunting dogs. Cats are popular. Food and stimulants. The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taken to certain ills. Stimulants are extremely popular, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household stills, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported spirits had spread widely in the unknown Khasi country, but efforts instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

children, but Christian influence has evaluated to
down underground the consumption by women and
children. Industrial arts. The only industrial arts are
domestic practiced in all households were a rude
weaver, carpentry and a simple utilitarian bamboo.
Other arts were few, and were practiced as village
specialists: the washing and smelting of iron ore and
the forging of bows, dies, knives, swords, and work-
ing gets (upland Khasi); the spinning of cotton
thread (Water village, Jaintia); the dyeing of cotton
thread and the weaving of cloth (Jaintia, Khasi,
Lyngngam, War); the spinning and weaving of Eri
silk (Khwang and Nongkrem villages, Khasi and
Jaintia); and the hand manufacture, without wheel,
of painted earthenware pots (Lawar village, Jaintia).
Indeveloping and the production of cotton goods have
much died out through the competition of machine-
made goods. Carpentry has greatly improved, by
innovation of major improvement in the sawing and
tailoring, on sewing machines, of ready-made gar-
ments for both sexes. (13 March 1966 C. W. 102)
Trade. Khasi villages normally contain a number of
household shops operated by women. Every Khasi
also lives within walking distance of several village
markets that are held on successive days of the
eight-day week. The basis of market attendance for
the members of any particular village can be roughly
distinguished by their naming the days of their week,
which are called after the active markets. The exception
was is the huge market at Shillong, much of which
is active daily, and which serves as a magnet for
Khasi from all over the hills. The traditional barter
has given way to currency in all markets. The small
ones consists of local some local farm produce, plus
other essentials like betel nut, and the betel and tea
stalls which serve as centers of social intercourse.
The big markets contain not only regional produce
and manufactures but also products from distant parts
of the hills, brought for sale by traveling middlemen.
There is also substantial trade, from the hills to the
valleys, in potatoes, pears, fishes, fat, cotton, coconut
shells, the wood of the ai tree, for silk thread, bam-
boos, coal, iron, betel leaf, betel nut, pan leaves,
turmeric, sugar cane, oranges, oil varnish, and chillies.
From the plains to the hills, there is trade in dried
fish, paddy rice salt, cooking oil, kerosene, matches,
tea, sugar, wheat flour, machine-made cloth, shoes,
metal pots, umbrellas, porcelain objects, coral beads,
silver and gold. Markets are important not only as
economic institutions but also as centers for recreation
(including archery competitions), courting, re-
affirmation of kinship ties with distant relatives, and
the dissemination of information of all kinds. (13
August 1966) Division of labor. Men do the
heavy work, such as clearing and burning the south-
ern fields, caring for cattle and goats and driving
them to market, hawking and selling large sets of
betel nut and pan, carpentry and sewing, and driving
and laboring on motor vehicles. Men also take many

[illegible] from October to December. For millet the seed is sown in April-May and reaped about six months later. Maize is usually sown in April-May and ripens in August-September. For potato, generally three crops are raised in the district; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

[illegible] For oranges and bananas, the orchards are cleared of weeds twice a year. Harvesting of oranges takes place from October to January. Bananas ripen at the beginning of the year and are collected between February and May.

[illegible] 3.6.3 Agricultural implements.—The usual agricultural implements are a hoe, a sickle, axes or four kinds of dao, a harrow, a crowbar which is used for the construction of irrigation channels, 'kurwa' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Mawphlang and Mawkyrwat in the plains of Jowai subdivision and in Mawphlang and Mawkyrwat the use is not in the place of the Khasi.

3.6.4. General cultural practices.—The cultivators mostly adhere to their indigenous practices of cultivation. Another of crops is not widely used. Cultivation of rice is usually done by broadcasting the seed though transplanting is also in vogue in some areas. Weed cutting is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

[illegible] 3.7 Cottage Industries.—Cottage industries in general, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, bamboo ware and dhoti, manufacture iron implements, earthenware, bamboo, cane and jewellery. In weaving women with their looms, weaving of cotton cloths is now gaining the Khasis. The Garos weave in Mawphlang and to some extent in Mawkyrwat. The Khasis weave in Mawphlang and to some extent in Mawkyrwat. The Khasis weave in Mawphlang and to some adjoining Garo Hills. Cotton and silk production is only for local domestic consumption. In general, the Government is trying to popularise weaving in the district and the Government is trying to popularise weaving in the district and the Government has been extended to the Khasis. Among other cottage industries has been extended to the Khasis. Among other cottage industries production of oil cakes in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

[illegible] 3.8 The People.—The Khasis and Jaintias are a short, sturdy race distinct from the neighbouring hill tribes. By nature they are gaudy and idolatrous and in respect of manual labour, they are the lazy and idolatrous. Side by side with the Khasis live the Nikiria, Garos and Hajongs who form respectively 1.00 percent and 0.02 per cent of the total rural population. Besides, there are plains people who are mostly concentrated in the area of Mawkyrwat. In the neighbouring districts of the border area there are a large number of Bengali Hindus who dominate the life of the rural in the border area.

[illegible] 3.9 Occupation.—The general portion of the population of the district adhere to cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists make well beside have a high regard for hard labour

and some the end to the area do not find anything to work as labourers in other's farms. It is almost necessary among the agriculturists to work in other's farms on wage basis, when agricultural operation in one's own farm are over. This is probably an outcome of the difficult transport situation. Among the non-agriculturists and those who follow agriculture as subsidiary occupation, a large number are persons and labourers engaged in jobs like transporting of goods from place to place, collection of bamboos, wood, fuel, etc. Cultivers not known of the district also offer employment to a good number of people. Since the taking up of small programmes under the plan, a large number of people are getting employment in construction of roads, etc. It is interesting to note that for construction of roads, not for all kinds of work demanding unskilled labourers, the district locally supplies the whole labour force. People in the various local pocket of the district, particularly those living in higher hills are mainly engaged in trade. The tribals are indefatigable traders and labourers able to keep almost the whole of the small trade in the district in their own hands. A small proportion of the people are engaged in cottage industries such as cotton ginning, brick making, bee keeping, blacksmithy, cane and bamboo works, etc.

The number of persons returned in the 1961 census under each of the eight main livelihood classes for the rural area of the district was as follows.

TABLE 1

Number of Persons (Source 1961 Census)

Class	Male	Female	Total	P.C.

• 246 464 **2.10 Labour and Wages.**— It has already been mentioned above that a large number of people subsist on labour—agricultural as well as non-agricultural. Owners of big orchards employ labourers for clearing of their orchards twice or thrice a year, plucking and transporting of produce to markets. Paddy cultivators with large farms engage labourers for ploughing and levelling of fields, sowing, harvesting and threshing of paddy. It should be mentioned that due to the peculiar agricultural practices prevalent in the district, the input of labourers even for paddy cultivation is higher than that in any of the plains districts of the State, which compels cultivators to hire labourers even for small paddy fields. In the case of cash crops, wages are usually paid in cash and for food crops it is paid in cash and kind more usually in kind. Wage rates for males and females are different which generally vary from Rs.1.00 to 1.25 for males and Rs.1.25 to Rs. 1.00 for females.

There are, however, numerous instances of engaging agricultural labourers at the rate of Rs. 0.50 per day. During the scarcity months the well-to-do farmers advance loans to the poorer section of the people on condition that repayment will have to be made by rendering labour on wage basis at the rate of Rs. 0.50 per day in the creditors farms whenever their services are demanded. Thus whenever their services are demanded the poor people have to work in creditor's farm even at the cost of ruining their own cultivations.

There are other instances where the labourers are paid less than usual wages. In some villages where there is dearth of work all the agricultural labourers gather together at some specified place early in the morning. The well-to-do farmers go there and through bargaining manage to engage the number of hands they want at very low rates. Similar bidding down of wages of non-agricultural labourers is also prevalent whenever demand for labour is very low.

Land utilisation and cropping

423 **2.11 Land tenure system.**—The district of United K.-J. Hills is not cadastrally surveyed and so far as land tenure is concerned, there is no rigid uniform or regular system worth the name, with the exception of those lands under the control of the State Forest Department and the Local District Council. There are different kinds of land under different systems, though for obvious reasons no reliable statistics can be gathered in respect of them. As far as land tenure system is concerned, Jowai subdivision is conspicuously different from Shillong subdivision. However, land in the whole district can be broadly placed under the following categories:—

423 **1. Rikyaat or Private land.**—They are private land belonging to certain clans or families but not to an individual according to Khasi custom. Neither Syiem nor District Council has got any power over them except the judicial powers to settle any dispute that may arise over any plot of land. The only connection is with the State Forests Department in respect of private protected forests who collects royalty from the produces of these forests if they are used for purposes of

19: Assam G-S (1958) 1963 AR7 Khasi AR7

There is another 102·21 acres of land in Subacherra in the Indo Pakistan Border which is under tea plantation since prepartition period After partition this area has fallen into India. But at present though tea plantation is still carried on, the revenue has never been collected at all since the company has gone to Pakistan. 423 651 648

There are also in Jowai subdivision 15 numbers of building land sites, mostly leased out to non Khasi individuals and institutions. They include building for churches, schools, hospitals and training classes, etc. The total area comes to 397·39 acres with a total revenue of Rs.216·84 per year. The period of the lease varies from one plot to another.

A part from land revenue, all the houses in Jowai subdivision are subjected to taxation. The rate is fixed at Rs.2 to Rs.6 per year according to the economic condition of the village. In Shillong subdivision only 31 Sirdarships which were formerly known as British Sirdarships have to pay house tax.

2.12 **Land Utilisation.**—The following table gives the area under important crops. 241 433

TABLE 2

	1958-59

Total	1,18,435	acres.

19: Assam G-3 (2006) 1965 687 (Guest) 687

3.3 **Measures so far taken.**—Since 1947, there has been constant demand from border people for relief and rehabilitation. Government undertook various measures to alleviate their difficulties. Government's attention to border problems has however, not been adequate. The common feeling of border people was that whenever the border position deteriorated due to some adverse measures adopted by East Pakistan authorities more attention was attracted, on the other hand, when the situation eased comparatively the Government's vigilance also slackened.

The various measures so far adopted by Government in border area, have been fully discussed and commented upon by the Border Rehabilitation Committee. These need no repetition here. But a few points emerging from the grievances put forward by the villagers during our investigation are noted below.

On the question of the scheme linked up with the issue of diversification of agriculture in border area, a large section of the border people skilled in the maintenance and operation of orchards are opposed to the idea of a complete switch over from cash crops to food crops in the cultivation of which they have no adequate experience. Moreover, there is the problem of getting adequate land in the vicinity for wet paddy cultivation. Indeed, having lost the market for some of the cash crops, some cultivators are trying to increase cultivation of paddy and other valuable crops on their own initiative wherever suitable land is available. But the problem of getting adequate funds for reclamation and improvement of land has stood as a serious handicap to them. Financial assistance to the needy and willing cultivators for reclamation works and taking up of more minor irrigation projects is very necessary.

As regards Government loans granted to cultivators, people complained that apart from being inadequate they are often untimely. As a result the people, needy as they are, utilise the amount for meeting their day to day consumption expenses.

There have been complaints that various improved seeds supplied by Government are of very inferior quality leading to waste of time and money of the poor people. The Department of Agriculture should not only check the quality of the seeds before issue but should also see that the seed are properly used by inexperienced cultivators who are newly taking up cultivation of these crops.

With the opening up of a few vital P. W. D. Roads transport of border products to Shillong and other places has greatly been facilitated but the problem of transporting them from remote interiors to the various local points on P. W. D. roads still remains unsolved. While during winter season these places may be negotiated by a man on foot up and down the steep gradients, during rainy seasons these tracks become slippery, the streams and rivulets are overflooded and it becomes impossible for a man to cross them, thus isolating the villages from each other leading to closure of trade and all other activities between villages. Properly planned test relief schemes for construction of feeder-roads and bridges linking up these villages, will, apart from giving some works to the people alleviate much of the difficulties of transportation of agricultural produce.

[illegible] [illegible] of [illegible]. [illegible] [illegible] [illegible]

[illegible] 5.13 Agriculture.—The following table summarizes a few salient features of agriculture in the selected villages:—

TABLE 5.13

Crops raised and agricultural operations prevalent in the selected villages.

Name of village	Important crops raised in the village	Agricultural implements used	Manure used

10. [illegible]	[illegible]	Cows and hoes	[illegible]	No.

This table reveals that in our region there is bias for cash crops and in the other for food crops—more or less depending upon the soil and topography of the regions. Extreme hardship occurs when there is deficiency in food production or a glut in the market of cash crops. The cash crop producers are, of course, trying to adapt their crops to the changing market conditions. With the loss of market for oranges, the people in the border areas are trying to increase their tendour production and more cultivating paddy, jowar, etc. Throughout the district, people are trying to increase wet paddy cultivation. Wherever water is available, they were at pains to convert it into a wet paddy field. Similarly, increasing interest is evident among the people in the cultivation of valuable crops like black-pepper, cardamom, etc., which have a good prospect in the border areas. It is felt that there is considerable scope for introduction of cultivation of chillies, turmeric, coffee, etc. But any new endeavour demands heavy initial investment which often is not within the reach of cultivators. Government should continue to advance adequate agricultural loans to the needy cultivators in a better planned manner.

Only 19 out of 89 villages reported use of bullock-drawn ploughs for wet paddy cultivation. But even in these villages animal power is not extensively used. Of course, in the rocky fields people have no alternative to the use of hoes and spades but in some areas particularly in the wet paddy field, bullock-drawn ploughs may profitably be utilised. It is not that the farmers do not realise the advantage of ploughing but want of funds for purchase of bullocks, etc., is reported to be the cause of continuance of the old practice. Both broadcasting and transplanting methods are in vogue in paddy cultivation the latter being a recent introduction is gaining popularity. Some farmers in the project area villages have tried line sowing but according to them it is very laborious and amounts to

It will be seen that wholly agricultural families, in Baxter area, Project area and General area are [illegible] and [illegible] p.c respectively of the total families. Classifying the wholly agricultural families and families [illegible] [illegible]
earning agriculture as principal occupation, as predominantly agricultural families-the proportion of such families for Baxter area, Project area and General area stand at [illegible] p.c, [illegible] p.c and [illegible] p.c respectively. There is a clear fall in the Baxter area the proportion of predominantly agricultural families is the lowest. The reason for this can be easily ascribed to the [illegible] received due to change of market after partition. A close study of tables [illegible] and [illegible] below and table [illegible] in the appendix will bear testimony to the fact that in Baxter area there is evidence of a shift of occupation from agriculture to non-agricultural occupations especially labour (non-agricultural).

Predominantly agricultural families have been classified into five groups:- Non-cultivating owner, owner cultivator, tenants, part-owner and part-tenants and landless agricultural labourers. The number of families and the proportion of each of these groups in the three areas are as follows:- [illegible]
[illegible]
[illegible]
[illegible]

TABLE [illegible]

Classification of Professionally Agricultural Families

Item	Quetta area			Pishin area			Chaman area		
	No. of families			No. of families			No. of families		
	Professionally agricultural families	Other agricultural families	Total	Professionally agricultural families	Other agricultural families	Total	Professionally agricultural families	Other agricultural families	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Non-cultivating owners	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Owner-cultivators [illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. Tenants [illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
4. Part owner and part tenant [illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
5. Landless agricultural labourers	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

TABLE [illegible]

Village areas			No. of families [illegible] land	Total area of holdings (Acres)	No. of the families [illegible] land	Area [illegible] (Acres)	No. of the families [illegible] [illegible]	Area [illegible] (Acres)	Area left fallow	Percentage [illegible]
(1)			(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
1. Barder area	...	...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Pargana area	...	...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. General area	...	...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

This is seen that of the unused land as least 30 per cent in Barder area, 14 per cent in Pargana area and 12 per cent in General area were left fallow.

Considering the number of families, it was found that in Barder area villages as many as 84 families had either totally leaved out or left fallow their unused land, the corresponding number for Pargana area and General area being only 9 and 1 respectively.

Total ..	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

6.33 It is significant that in all the three areas a considerable section of wholly agricultural families and families following agriculture as principal occupation are landless. On the other hand, a considerable proportion of the families with agriculture as subsidiary occupation or independent of agriculture have land of various sizes. The fact that agriculture for these families who possess sufficient land, was relegated to a subsidiary occupation or possibly made due to less return from agriculture than their attachment to it.

FRAGMENTATION

6.34 It has been observed that a large number of rural families have small holdings, the very smallness of which makes their holdings uneconomic. In addition, the holding of rural families suffer from the evils of fragmentation. Other holdings are not in compact blocks but are scattered all over and surrounded by lands in possession of others or some uncultivable waste land. Some of the fragments lie even in separate villages.

Unlike in the plains district, fragmentation here was brought about not so much by population pressure (except only in case of wet paddy field) nor intestate legislation or any other factors as would give rise to excessive fragmentation of holdings. This is because there is no enforcement regulation and the people are free to cultivate as much of the Raj land as possible for their cultivation. Fragmentation here has in this case a product of the topography of the district, for cultivable land in large compact block is not easy to get and cultivable land have to be found in isolated patches.

The extent of fragmentation is presented in the following table :

[illegible] The rural number of fragments in [illegible] holding in Sector of area [illegible] to [illegible] gives an average of [illegible] fragments per holding. In rural holdings in project area is [illegible] which gives an the average [illegible] fragments per holding, while in General area [illegible] holdings consisting of [illegible] fragments, i.e. [illegible] fragments per holding. A comparison of the above figure with the average fragments figure of [illegible], [illegible], [illegible] and [illegible] per holding in [illegible] Hills, Dhenkanal, Dhenkanal and Lakhimpur districts respectively goes to show that incidence of fragmentation in this district is higher than that in [illegible] but less than that in other districts.

It will be seen from table [illegible] at the appendix that in the small holding group (less than [illegible] acres) average number of fragments per holding is [illegible] in Sector, [illegible] in Project and [illegible] in General area. The average size in the corresponding holding group being [illegible] acres [illegible] acres and [illegible] acres, in Sector area, Project area and General area, the average size of fragments in the respective area works out at [illegible] acres, [illegible] and [illegible] acres. Similarly it will be seen that average size of fragments for medium holding group are, in Sector area [illegible] acres (average size of medium holding [illegible] acres) in Project area [illegible] acres (average size of holding [illegible] acres) and in General area [illegible] acres (average size of holding [illegible] acres) about for large holding group being [illegible] acres, [illegible] acres and [illegible] acres respectively against the average large holding size of [illegible] acres, [illegible] acres and [illegible] acres in the respective area.

PATTA

[illegible] 6.1 The operating unit in the rural agricultural sector is in most cases the family farm. Functions, enterprises, capital and general labour as regards to the agricultural operations in these farms are done through a joint effort of the family unit. Rarely permanent farm servants are maintained though employment of casual labourers are employed during the busy seasons.

[illegible] In this enquiry a farm has been defined as comprising of all agricultural land operated by a single family with or without employment of labour. The family may or may not have the right of permanent occupancy and inheritance over the farm land operated by it, and in this case the farm is distinguished from holding which comprises of such land only over which the family concerned possesses right of occupancy and inheritance.

TABLE D.4

Distribution of farms according to size

4.4 The summary distribution of farms in old Gram area is shown in the following table:—

Size of farm in acres	Sector area			Project area			General area		
	No. of farms	Total area (acres)	Average size of farm (acres)	No. of farms	Total area (acres)	Average size of farm (acres)	No. of farms	Total area (acres)	Average size of farm (acres)
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Below 1 acre	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
1 - 5 acres	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	—	[illegible]	[illegible]	—	[illegible]	[illegible]	—
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	—	[illegible]	[illegible]	—	[illegible]	[illegible]	—
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	—	[illegible]	[illegible]	—	[illegible]	[illegible]	—
Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

[illegible]

The total number of fragments in 837 holdings in Bardoli area is 2,340 giving an average of 2.80 fragments per holding. In all holdings in project area is 1,[illegible] which gives us the average 1.96 fragments per holding, while in General area 100 holdings consist of 402 fragments, i.e., 4.02 fragments per holding. A comparison of the above figures with the average fragment figures of 1.81, 1.32, 0.48 and 3.28 per holding in [illegible] Mills, Dhoring, Chhapra and Lakhapur districts respectively goes to show that fragmentation in this district is higher than that in [illegible] but less than that in other districts.

It will be seen from table [illegible] at the appendix that in the small holding group (less than 5 acres) average number of fragments per holding is 1.90 in Bardoli, 1.60 in Project and 2.01 in General area. The average size in the corresponding holding group being 1.38 acres 1.67 acres and 1.35 acres, in Bardoli area, Project area and General area, the average size of fragments in the respective area works out at [illegible] acres, [illegible] and [illegible] acres. Similarly it will be seen that average size of fragments for medium holding group are, in Bardoli area 1.41 acres (average size of medium holding [illegible] acres) in Project area 1.05 acres (average size of holding [illegible] acres) and in General area 1.01 acres (average size of holding [illegible] acres), while for large holding group being 2.11 acres, 1.[illegible] acres and [illegible] acres respectively against the average large holding size of [illegible] acres, [illegible] acres and [illegible] acres in the respective area.

FARMS

6.1 The operating unit in the rural agricultural system is in most cases the family farm. Functions, entrepreneur, capital and manual labour as regards to the agricultural operations in these farms are done through a joint effort of the family unit. Rarely permanent farm servants are maintained though employment of casual labourers are employed during the busy seasons.

In this enquiry a farm has been defined as comprising of all agricultural land operated by a single family with or without employment of labour. The family may or may not have the right of permanent occupancy and inheritance over the farm land operated by it, and in this sense the farm is distinguished from holding which comprises of such land only over which the family concerned permanent right of occupancy and inheritance.

It will be seen from the above table that the total number of farms in each of the three areas is greater than the number of holdings in the corresponding area. There are [illegible] farms in Border area [illegible], covering a total area of [illegible] acres, whereas the corresponding figure in case of holdings, as we have already seen, are [illegible] and [illegible] acres. In Project area [illegible] farms cover an area of [illegible] acres, the corresponding figures being [illegible] and [illegible] acres, while in General for holding area there are [illegible] farms which cover [illegible] acres as against [illegible] holdings covering an area of [illegible] acres. Two reasons may be ascribed to these differences. In the first place, proportions of village land are owned by people from outside and rented out to people of the village. Secondly, there are some among the right holders who cultivate only part of their land and the remaining portion is either left fallow or leased out to others. The position will be made clear from a study of subsequent tables viz., D-6 and D-7 given elsewhere in this chapter.

The average size of farms for Border area, Project area and General area respectively are 5.16 acres, [illegible] acres and [illegible] acres, which again are less than the corresponding figures of holding of [illegible] acres, 4.09 acres and [illegible] acres. The average size of farm is, however, hardly an adequate measure for judging the soundness of the farmers in as much a large proportion of cultivators ([illegible]%, [illegible]%, and [illegible]%, in Border area, Project area and General area respectively operates small size farms of less than 5 acres) exact average being 1.33 acres for Border, 1.16 acres for Project and [illegible] acres for General area and the total farm area cultivated by these cultivators constitute only 11%, 42% and [illegible]% of the total farm area in the Border area, Project area and General area respectively. In view some proportion of families operating middle-sized farms, i.e., between 5 to less than 10 acres are 41%, 40% and 42%, covering respectively 42%, [illegible]% and [illegible]% of the total farm area in the respective village groups. Proportion of families operating large sized farms, i.e., 10 acres and above in Border area, Project area and General area is respectively 19%, 4%, and 8%, possessing a comparatively bigger size of farm land amounting to 42%, [illegible] per cent and 18 per cent of the total farm land in the respective area.

6.7 The following two tables give the distribution of farms and farm areas respectively according to size and ownership.

[illegible]

TABLE [illegible]

Distribution of farmers according to size and ownership [illegible]

Size of farms	No. of farmers

TABLE D-7 (*concld.*)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
B. Project area—								
Small farms— (less than 3 acres)	305·12	59·39	28·67	41·58	70·65	333·59	100·87	434·46
Medium farms— (3 to less than 10 acres)	790·56	47·15	59·39	79·21	136·60	849·95	124·36	974·31
Large farms— (10 acres and above)	324·77	23·00	35·75	17·00	52·25	360·02	40·00	400·02
Total	1420·45 (78·53)	129·44 (7·16)	123·11 (6·81)	138·79 (7·80)	258·98	1543·56 (85·34)	265·23 (14·66)	1808·79 (100·00)
C. General area—								
Small farms— (less than 3 acres)	136·08	7·25	8·57	9·25	17·82	134·65	16·50	151·15
Medium farms— (3 acres to less than 10 acres)	300·07	8·00	7·73	16·86	24·37	307·80	24·86	332·66
Large farms— (10 acres and above)	38·00	—	4·00	9·00	13·00	84·00	8·00	92·00
Total	500·15 (87·90)	15·25 (2·65)	20·30 (3·53)	34·11 (5·93)	54·39 (100·00)	526·45 (91·48)	49·36 (8·57)	575·81 (100·00)

From the above tables it is evident that for all the areas in each size group small, medium and large, a high proportion of the farms (*i.e.*, in total 70 per cent in Border area, 78 per cent in Project area and 86 per cent in General area) is wholly owned and the area covered by those wholly owned farms also constitutes almost similar high proportions (*i.e.*, 79 per cent in Border area, 79 per cent in Project area and 88 per cent in General area) of the farm area available in the respective village group. Owned area under all farms amounts to 3238·66 acres (83 per cent of the total farm area) in Border area, 1543·56 acres (85 per cent) in Project area and 526·45 acres (91 per cent) in General area. Of this total owned area, in Border area nearly 95 per cent is covered by wholly owned farms and the rest by the partly owned farms. In Project area and General area respectively 92 per cent and 96 per cent of the total owned area are covered by wholly owned farms. Thus the area available for renting in Border area constitutes 17 per cent of the total farm land amounting to 675·52 acres of which 71 per cent is under wholly rented farm and 29 per cent under partly owned farm, in Project area total area available for renting constitutes 15 per cent (*i.e.*, 265·23 acres) of the total farm area of which 49 per cent and 51 per cent respectively are under wholly rented and partly owned farms while in General area 8·57 per cent (49·26 acres) of the total farm area are available for renting of which respectively 31 per cent and 69 per cent are covered by wholly rented and partly owned farms.

It is seen from Table D-7, that total rented area in Border area, Project area and General area are respectively 675·52 acres, 265·23 acres and 49·36 acres. A comparison of these figures with the figures of land leased out as in Table D-2 which are respectively 251.41 acres, 91·56 acres and 16·75 acres in the three areas, goes to show that some of the village lands taken in rent by the villagers belong to some right-holders who live outside the village.

CHAPTER VIII

Farm Output and sale

8.1 As a large majority of the family income is mainly from their farms, an attempt is made below to analyse the data collected on farm output, disposal and sale of produce. The data relate to the agricultural year March, 1957 to February, 1957. 241 433

8.2 Output: The following table sets forth some interesting data on farm output average cultivated area, etc. of cultivators by value groups.

TABLE 7-1

Number of families by Gross output group 162* 241 433

4000 and above	..	4	6	10	—	..	2	2	..	..	..	..

As is to be expected, large output groups are associated with higher farm size groups. It will also be seen that proportion of farms with an output of less than Rs. 500.00 per annum in Border area, Project area and General area are respectively 67 per cent, 55 per cent and 60 per cent. A joint consideration of the proportions and the size of cultivated area in the three groups indicates that the large majority of farms in Border area are less profitable than those in the other two areas though the farms in Border area are sown with very rich cash crops. This is further amplified by the fact that in Border area of the total number of farms fetching less than Rs. 500.00 a year, 35 per cent are medium sized farms and 4 per cent are large sized farms, the corresponding percentages for the Project area being 21 per cent and 1 per cent and for General area 27 per cent and 1 per cent respectively.

8.3.—The following table summarises the data on relative importance of crops, harvested area under different crops, average yeild of crops and sale proceeds, etc.

TABLE F-3
Yield rate of some important crops

Crop	Border area			Project area			General area		
	Gross farm area harvested (in acres)	Average yield per acre	Sale proceed (Rs.0.00)	Gross farm area harvested (in acre)	Average yield per acre	Sale proceed (Rs.0.00)	Gross farm area harvested (in acre)	Average yield per acre	Sale proceed (Rs.0.00)

241
433
435

241 311 433 **8·4—Relative importance of crops**—Total gross farm area harvested amounted to 3324.48 acres in Border area, 1700.40 acres in Project area and 561 acres in General area.

From above table it will be seen that in Border area, orange accounted for the highest proportion of harvested area, *i.e.*, 31 per cent, followed in order of importance by betel nut, paddy, betel leaf and millet which respectively accounts for 17 per cent, 19 per cent, 9 per cent and 3 per cent of the total harvested area. Other crops which account for 248.68 acres (7 per cent) includes maize, tezpata, banana, turmeric, dal, blackpepper and other fruit crops.

Considering sale proceeds, it is clear that betelnut happens to be the main earner accounting for 60 per cent of the total sale proceeds followed by orange, paddy and betel leaf which respectively account for 22 per cent, 6 per cent and 5 per cent of the total sale proceeds. Thus orange and betel leaf which in pre-partition days were the main earner-crops in the Border area have been passed to second and forth position respectively—the proportions fetched by them, particularly by betel leaf, being negligible. On other hand as there is a good market for betel nut, Border people have taken to betel nut cultivation in a more extensive scale.

241 245 311 433 It is significant that while in Border area total farm area is 3914 acres, total area harvested comes to only 3325 acres including area under mixed cropping which is in wide practice in Border area particularly for orange, betelnut, and for some other minor crops. Thus proportion of unharvested farm area emerges out to be considerable which can be accounted for the following reasons:—

(1) The farm area includes some new gardens particularly of betelnuts which usually take quite a few years to bear fruits.

[44] (2) Reportedly a large number of orange and betel-leaf gardens were not harvested at all as there was no market for them.

241 433 44 Turning our attention to Project area and General area, it will be found that paddy eclipses all other crops in as much as in the two areas it respectively covers 82 per cent and 61 per cent of the total harvested area in the respective area. In Project area paddy is followed by Betel leaf, orange, potato and betelnut in order of importance while in General area it is followed by potato, millet, orange, betel leaf and betelnut. In both the areas as will be seen from table above, almost all the crops retain their respective position in value. Considering sale proceed, in Project area, paddy occupies the highest position accounting for 77 per cent of the total sale proceeds followed by betel leaf, orange, betelnut and potato accounting respectively for 8 per cent, 5 per cent, 5 per cent and 1 per cent of the total sale proceeds. In General area, in order of importance of sale proceed paddy, potato and betelnut are worth mentioning fetching respectively 45 per cent, 30 per cent and 4 per cent of the total sale proceeds.

CHAPTER—X

Summary of main findings

125 10.1. Twenty-eight villages were selected for the purpose of the survey. Out of the 28 villages selected, 10 from Border area and 8 from Project area were selected purposively while the remaining 10 were selected at random from the entire district which is referred hereafter as general area.

166 Migration from big villages was rare but some migration was reported in respect of small villages.

164 Occurrence of Malaria, influenza and dysentery is a regular phenomenon in the area. Medical facilities were not found satisfactory and
743 as much as 78 per cent of the villages have no dispensary within a
871 radius of five miles. In regard to education, the facilities cannot also
489 be said to be unsatisfactory for more than 60 per cent of the villages
482 have a Lower Primary School. Transport facilities were not satisfactory and as much as 86 per cent of the villages still depend upon primitive mode of transport, namely head load. Correlated with outmoded form of transport, is the prevalence of unduly high cost of transport.

*162 10.2. The number of the families covered by the survey was 1006 in the Border area, and 647 in the Project area and 184 in the
161 General area. The average size of a village in the respective area is 100·6, 80·9 and 18·4 families. In the Border and Project areas females out number males being respectively 1076 and 1092 females per 1,000 males as against 940 females per 1,000 males in the general area
212 Literacy is as high as 34 per cent in the border area and 31 per cen
[562] in the Project area but as low as 17 per cent in the general area In all the areas literacy among females is very low.

*162 The working population (earners and earning dependents) is as high as 55 per cent in the Border area, 54 per cent in the Project area and 63 per
464 cent in the general area. While there were no cases of unemployment in the Project and General areas, 53 persons were reported unemployed from border area.

• 241 10.3. 51 per cent of the families in Border area are wholly agricul-
* 162 tural, 35 per cent partly agricultural and 14 per cent independent o
463 agriculture. The corresponding figures for the Project area are 61, 31 and 8 per cent respectively while for the General area they are 70 per cent, 29 per cent, 1 per cent respectively.

Predominantly agricultural families constitute 67, 76 and 90 per cent of the families in Border, Project and General areas respectively.

*162 10.4. 31 per cent of the families in Border area, 29 per cent in Project area and 10 per cent in General area were absolutely without any land while
423 25 per cent, 39 per cent and 24 per cent of the families in the respective areas possessed small holding ranging from 0·24 to 2·30 acres representing 11,24 and 26 per cent of the total holding area in the respective areas. 36 per cent of the families in Border and Project areas and 41 in General area possessed medium sized holding (3 to less than 10 acres)

accounting for 42, 54 and 58 per cent of the total holding area in the respective areas. Large holding (10 acres and above) covering 46, 22 and 16 per cent of the total holding area in the Border, Project and General areas respectively were possessed by 18, 7 and 5 per cent of the families of the respective areas. 162* 423

The average size of family holding worked out at 7.7 acres for Border area, 4·1 acres for Project area and 3·7 acres for the General area. The average size of cultivated holding per family in the three areas was found to be 5·1, 3·4 and 3·2 acres respectively.

10.5. The total number of farms in Border area, Project area and General area were respectively 759, 611 and 171 covering respectively 3914·18 acres, 1808·79 acres, and 575·81 acres, bringing the average size of farms to 5·16 acres in Border area, 3·54 acres in Project area and 2·20 acres in General area. 241 311 423

Percentage distribution of these farms and farm area by different size group is depicted in the following table.

241
911
423

Size of farms (acres)	Border Area			Project Area			General area		
	P. C. of farms (farms)	P. C. of area (area)	Average Size (acres)	P. C. of farms	P. C. of area	Average size (acres) (acres)	P. C. of farms	P. C. of area	Average size (acres)
1	2	3	4	5	6	7	8	9	10
1. Small farms (less than 3 acres).	44.14	11.13	1.33	54.41	24.00	1.56	53.22	26.25	1.66
2. Medium farms 3 to less than 10 acres).	41.60	42.18	5.24	39.72	53.97	4.90	42.11	57.77	4.62
3. Large farms (above 10 acres)	14.37	46.42	16.67	5.87	22.11	13.83	4.67	15.98	11.50
Total	100.00	100.00	5.16	100.00	100.00	3.55	100.00	100.00	2.20

426 Of the total number of loans 81 per cent in Border area, 18 per cent in Project area and 20 per cent in General area were free of interest while rate of interest for 9 per cent, 30 per cent and 60 per cent respectively of the loans in the three areas were found to be 20 per cent or more per annum which in cases ranged upto 200 per cent.

241 434 592 10.8. Farm output of 67 per cent of the families in Border area, 56 per cent of families in Project area and 60 per cent of families in General area were less than Rs. 500. a year, while 5 per cent, 30 per cent and 1 per cent of the families in the respective area earned more than Rs. 2,000·00 a year from their farms. Of the total number of farms fetching less than or Rs. 500.00 a year in Border area 35 per cent of them are medium sized farms and 4 per cent large sized farms, the corresponding proportions for Project area and General area being 21 per cent, 1 per cent, 27 per cent and 1 per cent.

24 433 10.9. In Border area the most important crops are oranges, betelnut, paddy, and betel leaf which respectively accounted for 31 per cent, 27 per cent, 19 per cent and 9 per cent of the total harverted area. In Project area paddy and orange are the most important crop which accounted respectively for 82 per cent and 8 per cent of the total harvested area. The most important crops in the General area are paddy and potato which respectively accounted for 61 per cent and 7 per cent of the total harvested area.

On the basis of data collected for all the villages investigated average yield per acre worked out at paddy 11.65 maunds, potato 21.61 maunds, oranges 5.77 lutis (5908 numbers) and betelnut 2.95 lutis (12980 numbers). These yield exhibited wide variation among the three areas.

434 592 10.10. Proportions of families with annual gross income of less than Rs. 750, Rs. 750 to less than Rs. 3,000, and above Rs. 3,000, were respectively found to be 49 per cent, 45 per cent and 6 per cent in Border area, 34 per cent, 60 per cent and 6 per cent in Project area and 45 per cent, 54 per cent and 1 per cent in General area. Average annual gross income per family worked out at Rs. 1,076·30 in Border area, Rs. 1,229.40 nP. in Project area and Rs. 864·36 nP. in General area which for predominantly agricultural and non-agricultural families respectively stood at Rs. 1,035·06 nP. and Rs. 1,161.91 nP. in Border area, Rs. 1,095·33 nP. and 1,644·36 nP. in Project area and Rs. 873.98 nP. and 780·84 nP. in General area. In all the three areas main contributors to family income were agriculture, service-profession-labour and trade accounting respectively for 41 per cent, 35 per cent and 15 per cent of the total average income in Border area, 37 per cent, 40 per cent and 9 per cent in Project area and 53 per cent, 36 per cent and 5 per cent in General area.

The net annual income per family in different income groups varied between Rs. 60 to 2,849 in Border area, between Rs. 110 to Rs. 3,508 in Project area and between Rs. 92 to Rs. 2,004 in General area. The average over all per family net annual income worked out at Rs. 853 in Border area, Rs. 989 in project area and Rs. 750 in General area and the same *per capita* at Rs. 231 in Border area, Rs. 215 in Project area and Rs. 153 in General area.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

(9) Cotton is grown on high lands and
248 slopes; it is sown in April, and becomes fit for picking by January.

311 AREA AND OUT-TURN OF CROPS.—According to the Assam Administration Report for 1875-76, the area of the British portion of
241 the Khásí and Jáintiá Hills District amounts to 2160 square miles,
648 of which only 110 are under cultivation; of the remainder, 1337 square miles are set down as cultivable, and 713 as uncultivable. The total area of the semi-independent Khásí States is given as 3997 square miles, of which 176 are under cultivation, 2561 are cultivable, and 1260 uncultivable. In another portion of the same Report, the area under various crops throughout the entire District is thus approximately estimated:—Rice, 59,880 acres; other food grains, 57,820 acres; cotton, 1076 acres; potatoes, 33,880 acres. The average out-turn of rice per acre is returned at 8 *maunds*, or nearly 6 cwt.; of other food grains, 3 *maunds*, or over 2 cwt.; of cotton, 2 *maunds*, or 1½ cwt.; of
[435] potatoes, 55 *maunds*, or nearly 40 cwt. The price of rice in 1875-76 was Rs. 4. 8 per *maund*, or 12s. 8d. a cwt., which gives Rs. 36 or £3. 12s. as the value of the rice crop obtained from one acre.

241 CONDITION OF THE PEASANTRY.—The Khásiás can scarcely be
423 considered an agricultural people, as they do not grow sufficient grain for their own subsistence, and are dependent to a great
433 extent on imports of rice from the neighbouring Districts. Ten acres is generally considered a comfortable holding for a husbandman in the position of an ordinary Bengal peasant, but scarcely any man in the Hills depends entirely upon the produce of his land for
[231] his support. In the Jáintiá Hills a cultivator's position is con-
[554] sidered to be very low if he possesses no cattle, but performs all the operations of agriculture with his own hands. In that portion of the District, five acres is all that can be cultivated with a single
[465] pair of oxen, the average being four acres. A husbandman with a holding of five acres would not be so well off as a retail shopkeeper, nor would it enable him to live as comfortably as he could on a money wage of Rs. 8 or 16s. a month. The peasantry, however, as a class are not in debt. The land is owned chiefly by small proprietors, who occupy and cultivate their hereditary fields. The relations of landlord and tenant do not exist in the Hills, and no rent is payable to any one; consequently the principle of Act x. of 1859 (the Rent Law of Bengal) has no application.

231 THE ANIMALS used in agriculture are oxen; goats and pigs are
435

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

reared either for food or as articles of trade. A pair of ploughing oxen are worth about Rs. 32, or £3, 4s.; an ordinary cow, Rs. 12, or £1, 4s.; a score of kids six months old, Rs. 16, or £1, 12s.; and a score of full-grown pigs, from Rs. 100 to Rs. 160, or from £10 to £16. 231 435

THE AGRICULTURAL IMPLEMENTS in use in the District consist of a plough, called *ka-jing-lúr* in Khásí, and a hoe or *kodáli*, called *u-mo-khiw*. When the cultivation is carried on by means of oxen, the plough is used, the hoe alone being used when the land is cultivated by manual labour. In the Khási Hills the use of the plough, except in a few rare cases, is entirely unknown; but in the Jáintiá Hills, oxen and ploughs are used to a greater extent. What is technically termed 'a plough' of land is equivalent to four English acres; a pair of oxen, together with the necessary implements, would represent a capital of about Rs. 40, or £4. 241 407 [435]

WAGES.—The Deputy-Commissioner reports that the price of labour in the District has more than doubled in the last ten years. The rates obtaining at present are from eightpence to one shilling a day for an ordinary labourer, and from one shilling to eighteenpence a day for a porter. An agricultural day-labourer earns sixpence, and a woman at the same work fourpence-halfpenny a day. Bricklayers, carpenters, and blacksmiths earn from a shilling to eighteenpence a day. The new Station of Shillong, the present seat of the Local Government, was established in May 1864, and since that date the demand for labour has markedly increased. The extension of the cultivation of potatoes has also had an appreciable effect on the price of labour. 178 464 465 [244]

PRICES OF FOOD GRAINS.—Of the different descriptions of rice in the markets of the District, the better sorts are imported from the neighbouring Districts of Sylhet and Kámrúp. The local produce is considered fit only for the use of the Khásiás. The price of the better descriptions depends entirely upon the distance from which the supplies come. In a distant market like that of Shillong, rice of the best quality generally sells at from 6 to 7 *sers* for the rupee, or from 16s. to 18s. 8d. per cwt.; and rice of inferior quality, which is only used by the poorer classes, at from 9 to 10 *sers* for the rupee, or from 11s. 2d. to 12s. 5d. per cwt. Little or no trade is carried on in unhusked grain. Paddy produced in the District generally sells at an average of from 15 to 16 *sers* per rupee, or from 7s. to 7s. 6d. per cwt. Indian corn, which is only grown to a small extent, is sold 435 439 243

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

273 krem. Before I could enter a hut the occupants
had to remove a man who was dead drunk. Over
352 the fireplace hangs a rack on which wood is piled
up for drying; also food provisions, rice, etc.
are kept dry here during the rainy season. Be-
hind it a rack made of sturdy beams runs straight
through the center and sometimes extends along
the sides. On it all kinds of household items
are kept. In the better houses the best dishes
of shiny, polished brass and china are displayed
here. This rack also serves as a partition be-
hind which, on the sides and at the rear wall of
the house, are the sleeping accommodations.
[356] Considering the very unprepossessing physical
appearance of the people, it is surprising how
orderly and clean the houses are kept inside.
342 In the principal towns the well-to-do have al-
ready adopted the brick building and European
comfort. With the Lynngam and the Bhoi, however,
we still find the pile dwelling (77). The houses

77. Gurdon, ibid., p. 32. There
it is mentioned (above) that in
some villages of the subdivision
of the War pile dwellings are
built because the main part of the
house rests on firm ground on the
mountain side and then extends on
piles over the slope. (Cf. the
Garo.) The same people still use
the bachelor house.

have a length from 10 to 12 meters with a veranda
which among the Lynngam is in front, among the
Bhoi in the rear of the house. These people
[241] still practise migratory agriculture and there-
fore move their flimsily constructed houses every
two or three years when they change to new fields.
It follows that the Khasi house, as described
above, represents an advanced construction method.
That in earlier days bamboo construction was

1:Gurdon E-4,5 (no date) 1907 AR7 Khasi AR7

when fire is applied, logs of wood being placed at intervals of a few feet to prevent as far as possible the ashes being blown away by the wind. The lands are not hoed, nor treated any further, paddy and millet being sown broadcast, and the seeds of root crops, as well as of maize and Job's tears, being dibbled into the ground by means of small hoes. No manure, beyond the wood ashes above mentioned, is used on this class of land; there is no irrigation, and no other system of watering is resorted to. The seeds are sown generally when the first rain falls. This style of cultivation, or *jhum*, is largely resorted to by the people inhabiting the eastern and southern portions of the Jaintia Hills, e.g. the Bhois and Lalungs, the Lynngams and Garos of the western tracts of the district. Wet paddy land (*kali* or *pynthor*) is, as the name implies, the land where the kind of paddy which requires a great deal of water is grown. The bottoms of valleys are divided up into little compartments by means of fairly high banks corresponding to the Assamese *ális*, and the water is let in at will into these compartments by means of skilfully contrived irrigation channels, sometimes a mile or more in length. The soil is made into a thick paste in the Jaintia Hills by means of the plough, and in the Khasi Hills through the agency of the hoe. Droves of cattle also are driven repeatedly over the paddy-fields until the mud has acquired the right consistency. The seed is then sown broadcast in the wet mud. It is not sown first in a seedling bed and then transplanted, as in Assam and Bengal. When the plants have grown to a height of about four inches, water is let in again; then comes the weeding, which has to be done several times. When the crop is ripe, the ears are cut with a sickle (*ka reshi*) generally, so as to leave almost the entire stalk, and are left in different parts of the field. A peculiarity about the Lyngam and the Khasis and Mikirs of the low hills, or Bhois as they are called, is that they reckon it *sang*, or taboo, to use the sickle. They reap their grain by pulling the ear through the hand. The sheaves, after they are dry, are collected and thrashed out on the spot, either by beating them against a stone (*shok kba*), or by men and women treading them out (*iuh kba*). Cattle are not used for treading out the grain. The grain is then collected and placed in large bamboo receptacles

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

(*ki thiar*). The paddy-fields are not manured. The Khasis, 243
when cultivating high lands, select a clayey soil if they can. In the early part of the winter the sods are turned over with the hoe, and they are exposed to the action of the atmosphere for a period of about two months. When the sods are dry, they are placed in piles, which are generally in rows in the fields, and by means of ignited bunches of dry grass within the piles a slow fire is kept up, the piles of sods being gradually reduced to ashes. This is the "paring and burning process" used in England. The ashes so obtained are then carefully raked over the field. Sometimes other manure is also applied, but not when paddy is cultivated. The soil is now fit to receive the seed, either high-land paddy, millet, Job's tears, or other crops, as the case may be. The homestead lands are plentifully manured, and consequently, with attention, produce good crops. They are cultivated with the hoe.

The cultivation of oranges in the southern portion of the 244
district ranks equally in importance with that of the potato in 245
the northern. The orange, which is known in Calcutta as the Chhatak or Sylhet orange, comes from the warm southern slopes of the hills in this district, where it is cultivated on an extensive scale. Although oranges do best when there is considerable heat, they have been known to do well as high as 3,000 ft.; but the usual limit of elevation for the growth of oranges in this district is probably about 1,000 to 1,500 ft. The orange of the Khasi Hills has always been famous for its excellence, and Sir George Birdwood, in his introduction to the "First Letter Book of the East India Company," page 36, refers to the orange and lemon of Garhwál, Sikkim, and Khasia as having been carried by Arab traders into Syria, "whence the Crusaders helped to gradually propagate them throughout Southern Europe." Therefore, whereas the potato was im- [77]
ported, the orange would appear to be indigenous in these hills.

Nurseries.—The seeds are collected and dried by being 247
exposed to the sun. In the spring nurseries are prepared, the ground being thoroughly hoed and the soil pulverized as far as possible. The nursery is walled with stones. The seeds are then sown, a thin top layer of earth being applied. The

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

After the plants have attained the height of about 6 in., they are earthed up. When the leaves turn yellow, it is a sign that the potatoes are ripe. The different kinds of sweet potatoes grown and the yam and another kind of esculent root—*u sohphlang* (*flemingia vestita Benth.*) will be noticed under the head of "Crops." 244

The Khasis possess very few agricultural sayings and proverbs, but the following may be quoted as examples:— 241 538

(1) *Wat ju ai thung jingthung ne bet symbai ha uba sniew kti.*

Do not allow plants to be planted or seeds to be sown by one who has a bad hand. [777]

As elsewhere, there is a belief amongst the Khasis that some people's touch as regards agriculture is unlucky. [826]

(2) *Thung dieng ne bet symbai haba ngen bnai, ym haba shai u bnai.*

Plant trees or sow seeds not when the moon is waxing, but when it is on the wane.

(3) *Wei la saw bha ka bneng sepngi jan miet phin sa ioh jingrang lashai.*

A red sky in the west in the evening is the sign of fine weather to-morrow.

Cf. our English proverb "a red sky in the morning is a shepherd's warning, a red sky at night is a shepherd's delight."

CROPS.

The varieties of rice found in the Khasi Hills are divided into two main classes, one grown as a dry crop on high lands, and the other raised in valleys and hollows which are artificially irrigated from hill streams. The lowland rice is more productive than that grown on high lands, the average per acre of the former, according to the agricultural bulletin, as ascertained from the results of 817 experimental crop cuttings carried out during the fifteen years preceding the year 1898, being 11.7 maunds of paddy per acre, as against an average of 9.4 maunds per acre (resulting from 667 cuttings made during the 243 433

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

243 same period) for the latter.* The average out-turn of both
433 kinds is extremely poor, as compared with that of any description of rice grown in the plains. The rice grown in the hills is said by the Agricultural Department to be of inferior quality, the grain when cleaned being of a red colour, and extremely
244 coarse. The cultivation of potatoes is practically confined to the Khasi Hills, there being little or none in the Jaintia Hills. The normal out-turn of the summer crop sown in February and harvested in June is reported by the Agricultural Department to be five times the quantity of seed used, and that of the winter crop, sown in August and September on the land from which the summer crop has been taken, and harvested in December, twice the quantity of seed. The winter crop is raised chiefly for the purpose of obtaining seed for the spring sowings, as it is found difficult to keep potatoes from the summer crop in good condition till the following spring. The usual quantity of seed used to the acre at each sowing is about 9 maunds, so that the gross out-turn of an acre of land cultivated with potatoes during the year may be taken at 63 máunds, and the net out-turn, after deducting the quantity of seed used, at 45 maunds. The above estimate of the Agricultural Department rests chiefly on the statements of the cultivators, and has not been adequately tested by experiment.

244 Since the appearance of the potato disease in 1885-86 there
439 has been a great decrease in the area under potato cultivation. In 1881-82 the exports of potatoes from the district were as high as 126,981 maunds. From 1886-87 the exports began annually to decrease until in 1895-96 the very low figure of 8,296 maunds was reached. The figures of export for the last nine years are as follows :—

1896-97	16,726 maunds.
1897-98	7,805 "
1898-99	9,272 "
1899-00	5,422 "
1900-01	29,142 "
1901-02	38,251 "
1902-03	36,047 "
1903-04	50,990 "

* See Bulletin No. 5 of the Agricultural Department of Assam, 1898, pp. 4 and 5.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

It will be seen that in the three years following the earthquake of 1897 the exports fell very low indeed. Since 1901 the trade has been steadily recovering, and the exports of 1904 reached half a lakh of maunds. 244 439 731

It will be observed that there has been some improvement, but the exports are still not half what they were in 1881-82. 244 There are two kinds of sweet potatoes grown in the district, the Garo potato (*u phan Karo*), which appears to have been introduced from the Garo Hills, and *u phan sawlia*, the latter being distinguished from the Garo potato by its having a red skin, the Garo potato possessing a white skin. These kinds of potato are planted on all classes of land except *hali*, they do best on jhumed and homestead lands. The yam proper (*u phan shynreh*) is also largely grown. The small plant with an edible root called by the Khasis *u sohphang* (*flemingia vestita Benth.*), is also largely grown. The roots of the plant after being peeled are eaten raw by the Khasis. As far as we know, this esculent is not cultivated in the adjoining hill districts. Job's tears (*coix lachryma-Jobi*) * are extensively grown, and 243 are planted frequently with the *sohphlang* mentioned above. This cereal forms a substitute for rice amongst the poorer cultivators. Maize or Indian corn (*u riew hadem*) is grown frequently, thriving best on homestead land, and requires heavy manuring; it is grown in rotation with potatoes. Next in importance to rice comes the millet (*u krai*), as a staple of food amongst the Khasis. There are three varieties of millets generally to be seen in the Khasi Hills:—*u 'rai-soh* (*setaria Italica*), *u 'rai-shan* (Paspalum sanguinale), and *u 'rai-truh* (Eleusine coracana). *U 'rai-shan* is cultivated in rotation with the potato, *u 'rai-soh* and *u 'rai-truh* are generally cultivated on jhumed land, where they thrive well. Millet is sometimes used instead of rice in the manufacture of spirit by the Khasis; [274] *u rymbai-ja* (*phaseolus calcaratus*), and *u rymbai ktung* (*glycine soja*) are beans which are cultivated occasionally. Khasis highly prize the fruit of the plantain, which they give to infants 245 mashed up. The following are the best known varieties:— 853 *Ka kait khún, ka kait siem, ka kait kulbuit, ka kait bamon, ka kait shyieng.*

* Khasi *u soh-riew.*

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

301 This stone is apparently some rough gem which may be picked up by the Lynngams in the river beds. A rich man amongst
556 them, however, is one who possesses a number of metal gongs,
534 which they call *wiang*. For these they pay very high prices,
436 Rs. 100 being quite a moderate sum for one of them. Being curious to see one of these gongs, I asked a *sirdar*, or head-man, to show me one. He replied that he would do so, but it would take time, as he always buried his gongs in the jungle for fear of thieves. Next morning
[531] he brought me a gong of bell metal, with carvings of animals engraved thereon. The gong when struck gave out a rich deep note like that of Burmese or Thibetan gongs. These gongs have a regular currency in this part of the hills, and represent to the Lynngams "Bank of England" notes. It would be interesting to try to ascertain what is their history, for no one in the Lynngam country makes them in these days. Is it possible that the Garos brought them with them when
534 they migrated from Thibet? The gongs are well known in the
622 Garo Hills, and I hear that when a *nokma*, or head-man, there
778 dies his corpse is laid out upon them. They thus possess also an element of sanctity, besides being valuable for what they will fetch to the Garos or Lynngams. We may hope to hear more about them in Captain Playfair's account of the Garos.

304 The Lynngams do not tattoo. Their weapons are the large-
411 headed Garo spear, the dao, and the shield. They do not usually
243 carry bows and arrows, although there are some who possess them. They are by occupation cultivators. They sow two kinds of hill rice, red and white, on the hill-sides. They have no wet paddy cultivation, and they do not cultivate in terraces like the Nagas. They burn the jungle about February, after cutting down some of the trees and clearing away some of the debris, and then sow the paddy broadcast, without cultivating the ground in any way. They also cultivate millet and Job's-tears in the same way. With the paddy chillies are sown the
241 first year. The egg plant, arum, ginger, turmeric, and sweet
231 potatoes of several varieties are grown by them in a similar
784 manner. Those that rear the lac insect plant *landoo* trees (Hindi *arhal dal*) in the forest clearings, and rear the insect thereon. Some of these people, however, are prohibited by a

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

workers and they were few in number.[1] They were particularly employed for such work as the clearing of jungle for new pan gardens in summer. 245 464

In the orange season (December to February) the number of workers increased and they were paid more: Rs. 1/8 were paid[2] for one load (one person carrying 80 pounds of oranges, from an orange garden to the railway station—about two miles). Usually a worker made three to five trips a day. Many workers from Jaintia used to come for this particular season. 245 464 465

Semi-permanent workers were engaged for wet rice fields. They were usually Hindu cultivators: since these Khasi and other tribes do not know the technique of wet cultivation, plains people like the Biharee immigrants were engaged. These workers were provided with servants' quarters where they lived with their wives and children. However, very few Jatinga households possessed rice fields. 243 464

The economic prosperity of Jatinga reached its climax during the period from 1934 to 1940. Since 1942, the orange production has been decreasing. In 1945, a serious disease attacked the orange gardens as well as the pan-leaf gardens. Besides, by depriving Jatinga, as it had Shella, of their most important markets, Dacca and Sylhet, the Partition of India and Pakistan in 1947 caused a serious economic depression in the whole region. On the other hand, because of the past prosperity, the population has rapidly increased during the last ten years. The serious economic condition of Jatinga is illustrated in the petition which was submitted by the Jatinga people when the Governor of Assam visited those areas in January 1956. It runs thus: 245 434 731 161 458

"Since the last ten years or so, with the increase of population in the village and with the loss of fertility of the soil, the people were faced with economic depression. At present they are facing acute shortage of land they have also no scope to adopt other forms of cultivation like jhuming and wet rice cultivation, etc. Moreover, there has been successive attack of Bright's disease which destroyed and wiped out all the orange and pan gardens. And as such, majority of the families have to depend for their livelihood on daily wages. . . ."

It is indeed a serious situation for them, because the Khasi do not produce staple foods, such as rice; their economy is completely dependent on the trade of their products by which they purchase their main provisions, clothes, etc. Other peoples round Jatinga, being jhum cultivators, can at least get rice and cotton: the minimum requirements, staple foods and clothing are available even in the worst conditions, so that they can at least maintain themselves though the standard of living is low. As I stated before, a few households in Jatinga possessed rice fields, but the majority had none. Recently they rented some plots of jhum field for rice cultivation from Zemi-Naga of neighbouring villages.[3] However, its yield was but a small percentage of their consumption. A few 182 434 [433] [243]

1. If they had worked in the gardens of Jatinga, they might have got more profit than from their own jhum fields. For one day's labour, they got Ans. 8/. For one month, they could earn Rs. 15 with which they could buy about 4-5 maunds of rice (one maunds paddy cost Rs. 3-4). For one year it became 50 maunds, which was impossible to produce in a jhum field by a single person's labour. [435]

2. These rates, including the figures of note 1, apply to 1956.

3. Jatinga villagers told me that Zemi-Naga were kind enough to lend them their field for a negligible rent, though they had not enough for themselves. Zemi-Naga said that they owed much to Jatinga in the past, so that now they sympathised with the condition of Jatinga, and offered some parts of their jhum field. [427] [628]

nure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Bhoi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country are paddy rice, lac, caoutchouc, cotton, bananas, and pineapples; in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmiller 1925.] **Gathering.** Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

Uptill now the main sources of forest revenue in the district are timber, limestone, lac, bay leaf and elephants. 13

2.6 **Agriculture.**—The greater proportion of population of the district subsist on agriculture. The staple crops raised in the district are wet and dry rice, various kinds of millets, maize, potatoes, pineapples, oranges, arecanut, betel-leaf and bay leaf. To a smaller extent they grow in the gardens round their houses vegetables, pulses and occasionally sugarcane. 24

2.6.1 **The main crops : Rice.**—While wet rice is grown in the valleys with which the hills are intersected, dry rice is grown on the hill sides. Highland rice is seldom grown twice running on the same spot for after one crop the soil is exhausted and a fallow period of four to five years is usually allowed. Jowai subdivision is predominantly a wet rice producing area. In Shillong subdivision main wet rice pockets are the Bhoi area stretching upto the sung valley and the northern portion of the plateau, the Mylliem state, the south-western portion of the district and the southern plain portion of the district adjoining East Pakistan. Dry rice is grown more or less through out the district. While Jowai subdivision can claim self sufficiency in rice, Shillong subdivision is a deficit area and the people in this subdivision particularly those in the southern portion (border area) of the district have to depend on supplies from outside. Though there is no reliable statistices of the area under rice, a rough estimate is given elsewhere in the land utilisation table. 243

Maize and millet.—Are two important food crops of the district grown more or less throughout the district.

Potatoes are extensively grown in the higher slopes and in the lower land which are well drained. Generally two crops of potatoes are raised annually in the district. In respect of production and export of potato this district occupies the topmost position in the State of Assam. 244

Orange, betel leaf and arecanut are most extensively grown in the southern base of the hills, *i.e.* all over the border areas. Oranges are also grown in Bornihat areas, in the northern portion of the district. Orange and betelnut plantations extend from the foot of the hills to a height of about 1500 feet and are carried up the ravines which score the southern face of the high plateau. The district is an important producer of Bay-leaf which is abundantly found in the border areas of the district. Other valuable cash crops of the district are black pepper, turmeric, chillies, ginger, pineapple and various other fruits. 245

2.6.2 **Agricultural seasons.**—For wet rice, the lands which are naturally irrigated by virtue of their very location, are ploughed or hoed by about the middle of February and seed sown in May or June. Harvesting takes place in October and November. For dry rice, the land is hoed by about the middle of September, the solds are collected into little heaps and burnt and by February the land is again hoed up and the seed sown in April - May. Harvesting goes 243

on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in April-May and ripens in August - September. For potato, generally three crops are raised in the district ; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

For oranges and betelnut the orchards are cleared of weeds twice a year. Harvesting of orange takes place from October to January. Betelnut ripens at the beginning of the year and are collected between February and May.

2.6.3 **Agricultural implements.**—The usual agricultural implements are a hoe, a sickle, three or four kinds of doas, a harrow, a crowbar which is used for the construction of irrigation channels, 'sierras' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and resembles the one in use in the plains of the State.

2. 6. 4. **General cultural practices.**—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

2.7 **Cottage Industries.**—Cottage Industries, it appears, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, pottery, baskets, mats and jewellery. In striking contrast with other districts weaving of cotton clothes is rare among the Khasis. The Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir Hills practice it only for their domestic consumption. At present, the Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

2.8 **The People.**—The Khasis and Jaintias are a short sturdy race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free from any inhibition. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.38 percent and 3·27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

2.9 **Occupation.**—The greater portion of the population of the district subsists on cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

8·5—In the following paragraphs we have reproduced the yield rates of different crops, calculated on the basis of area harvested and total produces reported by the cultivators. For assesment of correct yield rates it is necessary to conduct a scientifically designed crops cutting survey which in view of its largeness in magnitude and other complexities associated with the type of experiments, could not be fitted in with the programme of the present survey. It is admitted that the yield estimates worked out by us are proved to be subjected to the usual limitations of this type of data. 128 433

Yield

1. **Paddy.**—It will be seen from table above that average yields of paddy per acre for Border area, General area and Project area are respectively 8.38 maunds, 12.92 maunds and 12.60 maunds and for the district as a whole it comes to 11.65 maunds though there are cases where maximum yield goes to above 18 maunds per acre. Thus it is seen that the average yield is much less than the average yield for the State of Assam (plain district) which is above 18 maunds per acre. Average yield in Border area is evidently much smaller. Apart from low fertility of land, another reason for this low average is that in a number of villages selected from Border area such as Syndai, Amki and Lumshnong, there was widespread havoc to standing crops was caused by wild elephants. 243 433 [136]

2. **Potato.**—The average for the three areas comes to 21·61 maunds per acre which is in contrast to the State average of above 40 maunds per acre. Our estimate has in fact been lowered due to inclusion of a few villages in the foot hills where potatoes don't grow well, otherwise in a number of high altitude villages, yield per acre well exceeded 40 maunds. The average for Border area is rather too low. Apart from unsuitability of Border land of high altitude potatoes another reason for this low average is that during the reference year the crop suffered from widespread incidence of pests and insects. 244 433 [136]

3. **Orange.**—yield of orange in Border area, Project area and General area was found to be 5. 27 luties or 5396 numbers against 16.76 luties or 17162 numbers and 2.80 luties or 2867 numbers respectively Thus the average yield in Border area, even considering the mixed nature of some gardens is much low. The reasons are obvious. 245 433

4. **Betelnut**—Average yield per acre from Border area, Project area and General area was found to be 2.93 luties (18752 numbers), 4.11 luties (26304 numbers) ann 3.03 luties (19392 numbers) respectively bringing the average for all the three areas to 2.95 luties per arce. 249 433

5. **Betel leaf.**—Average yield per acre works out at 17·15 kuris, 50.64 kuris and 24 kuris in Border area, Project area and General area respectively. Thus in Booder area the average is much lower. This is due to the fact that most of the gardens remained unplucked for want of market for leaf.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

361 In the interior of the Hills the largest villages are mere clusters of
463 huts. The great majority of the inhabitants are employed in agriculture, but there are no data upon which a proportion of agriculturists to non-agriculturists could be based.

167 There is no immigration into the District. Both the Khásiás and
178 the Syntengs have been successful in preserving to the present day their primitive isolation, free from the interference of Hinduism. They still maintain their aboriginal forms of belief and re-
[771] ligious worship, and repudiate alike the authority of Bráhmans and
[262] the entire system of caste. To some extent, however, they have given way to Hindu prejudices in the matter of purity of food. The
[563] few Hindus to be found in the Hills are temporary residents, engaged in civil and military employ, who always contemplate returning
[441] to their own homes. The traders are for the most part natives of the Hills; for the Márwárí merchants, who penetrate into every other corner of Assam, have been able to obtain no footing in the face of Khásí competition. There is likewise no emigration from the District. The hillmen are a well-to-do and contented race, and either produce themselves or obtain by trade sufficient to satisfy
[166] their scanty wants. A certain number of both Khásiás and Syntengs proceed southwards every year to work on the tea gardens of Cáchár and Sylhet, but such absence from home is only temporary.

243 AGRICULTURE: RICE.—Thirteen different varieties of rice are cultivated in the District, of which the following is a list, giving the Khásí name as well as the description of the grain:—(1) *U-kyba-khynriam* (*u*, the masculine article, meaning 'the,' and *kyba*, noun masculine, meaning 'paddy'), brown rice with long grain; (2) *u-kyba-khynriam bai-lih*, a white rice with long grain; (3) *u-kyba la-toh*, round-grained rice; (4) *u-kyba ksai*, bearded, husked; (5) *u-kyba-dew-ba-iong*, black husked rice (literally *u* = 'the,' *kyba* = 'paddy,' *dew* = 'earth,' *ba* = 'that,' *iong* = 'black'); (6) *u-kyba-ba-lih*, white rice; (7) *u-kyba-seim*, scented rice (literally *u* = 'the,' *kyba* = 'paddy,' *seim* = 'royal'); (8) *u-kyba la-kroh*, large-grained rice; (9) *u-kyba-ba-tlang*, small-grained rice; (10) *u-kyba sa-bia*, early rice; (11) *u-kyba ra-bon*, late rice; (12) *u-kyba tang-la*, rice grown along with beans; (13) *u-kyba-ba-túh*, small rice.

Rice is cultivated in marshy fields situated near running water as well as in high lands. The first seven of the above thirteen species of rice are sown in marshy lands during the months of April and May,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

243

and reaped generally in November and December, although in some parts of the hills the harvesting season commences as early as October. The following is the mode of cultivation pursued. About the middle of February, the husbandman commences to prepare the land by bringing water to his fields from neighbouring streams by means of regularly-cut channels. His land is thus kept inundated for from fifteen to thirty days, in order to soften the soil, when part of the water is allowed to escape through openings made in the banks surrounding the field. The land is then ploughed, the ploughing being called *lur-snih*, and three or four days afterwards it is made to undergo a second ploughing, called *lur-kyn-roi*. The fields are then refilled with water by the same means as before, and allowed to remain covered from ten to fifteen days, when the water is again drained off. After this the land is ploughed a third and a fourth time, the ploughings being termed *lur-shat* and *lur-bet* respectively, and the soil is made as smooth as possible with the hands or a hoe (*kedili*). The seed is then scattered broadcast over the field. Transplanting is not practised in the District. When the plant has sprung up about six inches above the ground, water is introduced into the field a third time, and allowed to stand for about two months, when it is drawn off for a few days, in order that the land may be weeded. After weeding, water is again let in, and is not drained off till the crop is ripe for the sickle. The other six varieties are grown on high lands, the mode of cultivation adopted being as follows:—About the middle of September the grass on the ground to be cultivated is turned up with a little of the soil attached to the roots, and allowed to remain until about February, when the turf so dug up is collected into heaps and burnt. In March or April, according as the rains happen to be early or late, these heaps are broken up and scattered over the fields. The land is then ploughed twice, or merely dug up with a hoe, and the seed is then sown. After sowing, the plough or hoe is used to cover up the seed, which sprouts in about ten days. Showers of rain at short intervals are now looked for, but too much rain, or, on the other hand, a succession of dry days, would injure the crop. As the plant acquires strength, less anxiety is felt concerning the rainfall. About the middle of September the ears begin to appear, and in November the grain is reaped. This description of rice is never grown for more than two successive seasons on the same land. No improvement has taken place within the last twenty years in the quality of the rice grown in

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

243 the District, nor do any superior kinds of cereals appear to have been substituted for inferior ones.

THE DIFFERENT STAGES OF RICE CULTIVATION, in English and Khásí, are as follow:—The blade as it first shows, *spch-u-kyba;* the blade when well above the ground, *la-thylleng-u-kyba;* the ears when first formed, *lam-mat;* the ears beginning to ripen, *byr-tem;* the ripe ears, *la-hih;* unhusked rice, *u-kyba;* husked rice, *u-khaw;* cooked rice, *ka-ja.*

262 [435] [782] THE VARIOUS SOLID AND LIQUID PREPARATIONS made from rice are the following:—(1) *U-kypu*, cakes of different kinds, sold at six or twelve for a penny, according to size. (2) *U-shirá* or *gáh-khir*, prepared by the hillmen as an offering to their deity at the conclusion of the harvest. (3) *Kadam*, fermented rice water, sold at the rate of from three-farthings to threepence per quart, according to the strength of the liquor. (4) *Ka kiad-phatika* or *ka kiad-hárak*, a kind of spirits distilled from rice, and sold at from threepence to fourpence-halfpenny per quart.

273 435

243 OTHER CEREALS.—Indian corn, or *u-riu-ha-dem*, is grown on homestead lands. The ground is first manured, and the seed is sown about the middle of April. The crop is fit for cutting in September and October. A kind of millet seed called *u-krdi* is commonly sown with paddy on high lands. For want of more suitable land, however, this crop is often cultivated by itself on rocky slopes; and when this course is adopted, the jungle is first cut down in February and burnt. The seed is sown in April, and the crop gathered in December.

244 PULSES AND FIBRES.—Only two kinds of pulses are grown in the Hills, *u-rym-bai-ktung* and *u-rym-bai-jid*, both of which are varieties of beans. They are sown on high lands in March and April, and gathered in December. The only fibre is that made from the pine-apple stalk, which is largely used for making netted bags.

283

245 [439] MISCELLANEOUS CROPS.—(1) Oranges.—There are numerous orange plantations in the neighbourhood of Cherrá Púnjí, and the fruit is exported to all parts of Bengal. In the year 1876-77 the estimated exports were 9,400,000 in number, valued at Rs. 37,600, or £3760, at the rate of Rs. 12 or £1, 4s. per three thousand. These figures show a decrease in number as compared with the estimated export twenty years ago. The trees flower in March or April, and the fruit ripens in October and the following months. In some cases the oranges are allowed to remain on the trees till March, but

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

reared either for food or as articles of trade. A pair of ploughing oxen are worth about Rs. 32, or £3, 4s.; an ordinary cow, Rs. 12, or £1, 4s.; a score of kids six months old, Rs. 16, or £1, 12s.; and a score of full-grown pigs, from Rs. 100 to Rs. 160, or from £10 to £16. 231 435

THE AGRICULTURAL IMPLEMENTS in use in the District consist of a plough, called *ka-jing-lúr* in Khási, and a hoe or *kodáli*, called *u-mo-khiáw*. When the cultivation is carried on by means of oxen, the plough is used, the hoe alone being used when the land is cultivated by manual labour. In the Khási Hills the use of the plough, except in a few rare cases, is entirely unknown; but in the Jáintiá Hills, oxen and ploughs are used to a greater extent. What is technically termed 'a plough' of land is equivalent to four English acres; a pair of oxen, together with the necessary implements, would represent a capital of about Rs. 40, or £4. 241 407 [435]

WAGES.—The Deputy-Commissioner reports that the price of labour in the District has more than doubled in the last ten years. The rates obtaining at present are from eightpence to one shilling a day for an ordinary labourer, and from one shilling to eighteenpence a day for a porter. An agricultural day-labourer earns sixpence, and a woman at the same work fourpence-halfpenny a day. Bricklayers, carpenters, and blacksmiths earn from a shilling to eighteenpence a day. The new Station of Shillong, the present seat of the Local Government, was established in May 1864, and since that date the demand for labour has markedly increased. The extension of the cultivation of potatoes has also had an appreciable effect on the price of labour. 178 464 465 [244]

PRICES OF FOOD GRAINS.—Of the different descriptions of rice in the markets of the District, the better sorts are imported from the neighbouring Districts of Sylhet and Kámrúp. The local produce is considered fit only for the use of the Khásiás. The price of the better descriptions depends entirely upon the distance from which the supplies come. In a distant market like that of Shillong, rice of the best quality generally sells at from 6 to 7 *sers* for the rupee, or from 16s. to 18s. 8d. per cwt.; and rice of inferior quality, which is only used by the poorer classes, at from 9 to 10 *sers* for the rupee, or from 11s. 2d. to 12s. 5d. per cwt. Little or no trade is carried on in unhusked grain. Paddy produced in the District generally sells at an average of from 15 to 16 *sers* per rupee, or from 7s. to 7s. 6d. per cwt. Indian corn, which is only grown to a small extent, is sold 435 439 243

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

435 439 at the rate of two or three ears for a farthing; and sugar-cane, the [243] cultivation of which is also very limited, at from a little over a farthing 273 435 to three-farthings per cane. A fermented liquor called *kadam*, made from rice, is sold at from three-farthings to threepence a quart, according to strength; and a distilled spirit called *phatika*, or *kakiad-hárak*, at from threepence to fourpence-halfpenny a quart. This latter description of liquor is sometimes made very strong. No records exist by which the present prices of the above articles can [731] be compared with the rates ruling ten years ago. The maximum price of rice during the famine of 1866-67 was 5 *sers* 6 *chhatáks* for the rupee, or about £1 a hundredweight.

804 805 MEASURES, WEIGHTS, ETC.—The Hill people have no proper measurement of time or distance. If there be any standard for measuring distance, it is by the number of *pins* a man chews in the course of a journey, generally about one every half hour. In some parts of the District, land is measured by a stick called *ka dieng-nong*, varying in length from six to seven cubits. Liquids are measured in gourds of different measures, varying from half a *chhaták* to a *ser*, and also in bamboo tubes. Rice, potatoes, beans, etc. are measured in baskets, varying in size in different markets from two to eighty pounds.

805 In the Khásí Hills the inhabitants reckon eight days in the week, named as follows:—(1) Lyn-kah; (2) Nong-krem; (3) Um-long; (4) Rang-hep; (5) Shillong; (6) Pom-tih; (7) Um-nih; (8) Yeo-duh. In the Jáintiá Hills the eight days are named thus:—(1) Kyllao; (2) Pyn-sing; (3) Máo-long; (4) Máo-siang; (5) Máo-shai; (6) Pyn-kat; (7) Thym-blein; (8) Ka-hat. The Khásí months of the year, calculated by moons, are as follow:—(1) U Kylla lynkot; (2) U Rym-pang; (3) U Lyber; (4) U Laiong; (5) U Jimmang; (6) U Jilliw; (7) U Nai-túng; (8) U Nai-lar; (9) U Nai-lúr; (10) U Rysow; (11) U Nai-wing; (12) U Noh-prah.

464 423 LANDLESS LABOURING CLASSES.—There is, and always has been, a large class of labourers in the District who neither rent nor possess any land. Women and children are employed in manual out-door labour of all kinds.

423 [427] VARIETIES OF LAND TENURE can hardly be said to exist. There is nothing whatever resembling the relations between landlord and tenant throughout the Khásí Hills. The lands as a rule are either ancestral property or belong to village communities, and are cultivated under unwritten but well-understood agreements. Of the wide

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

extent of waste land, some is cultivated in a manner resembling the *júm* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *júmiá* tenure. Any renting of land is exceptional, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

MANURE is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 2s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 243 244 [435]

IRRIGATION for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

MODEL FARM.—The Shillong Model Farm, established in 1873, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red roughs' and 'pheasant's eye'—were successfully introduced in 1873-74; but these are not looked upon favourably by the Khásiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unfitness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1744 177 244 648 654 177 245 648 654 [134] [136] 231 648 654

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

 000

supply. As the District depends so largely for its supply of rice 243
upon Sylhet and Kámrúp, the state of the markets in those places 433
exercises a greater influence on the rates in the Hills than any 439
failure of the local harvest. In the year 1858 the price of common [435]
rice is said to have risen as high as 6 *sers* for the rupee, or 18s. 8d. per cwt., in consequence of the failure of the crops in the plains.

ROADS AND MEANS OF COMMUNICATION.—The following are the 491
eight principal lines of road in the Khási and Jáintiá Hills:—(1) Road from Shillong to Gauhátí, in Kámrúp. This road has recently (1877) been opened for wheeled traffic throughout its entire length. The Deputy-Commissioner's Report for 1876-77 states that the number of passengers passing up and down may be estimated at about 800 or 1000 every month, and the number of carts already used at about 50. The *tonga dák* brings travellers up [493]
to Shillong from Gauhátí in two days by a comfortable and easy carriage service, while for natives a cheaper conveyance by bullock cart is available. At Gauhátí there is a good *dák* bungalow in charge of a *khánsámá*, where the usual accommodation provided in a hotel is to be found. The stages to Shillong are as follow:—(*a*) Gauhátí to Bornihát, 17 miles. The road is good throughout. There is a *dák* bungalow in charge of a *chaukidár* at Bornihát, where grain and rice are procurable. (*b*) Bornihát to Nongpoh, 14½ miles. The road is hilly throughout, but good. At Nongpoh, which is at an elevation of 1900 feet, there is a *dák* bungalow in charge of a *khánsámá*, from whom tea, liquors, and biscuits, etc. can be obtained. The *dák* bungalow is furnished with bedding, linen, etc. Grain and rice can be purchased in the *bázár*. (*c*) Nongpoh to Um-sning, 16½ miles. At Um-sning, elevation 2700 feet, there is a *dák* bungalow in charge of a *chaukidár*. Supplies or coolies are not procurable, but sometimes grain and rice can be purchased. (*d*) Um-sning to Um-jam, 9½ miles. At Um-jam there is a Public Works Department rest-house in charge of a *chaukidár*. Supplies or coolies are not procurable. (*e*) Um-jam to Shillong, 9½ miles, of which 6½ are a continuous ascent. At Shillong there are *dák* [485]
bungalows in the Artillery Lines, containing four separate rooms. A *khánsámá* is in attendance, and the rooms are completely furnished with bedding, linen, etc. This entire road, which has a total length of 67 miles, is as perfect a hill road as could be seen in any country, and a model of engineering skill. (2) Road running from Gauhátí across the Hills, *via* Nongklao, Máo-flang, Cherrá

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

439 previous twenty years. The oranges, like the lime, were brought
648 down to Mr. Inglis' depot at Chhaták, where they were sold to
245 the dealers at the rate of about Rs. 1. 12 per 1000, or less than
434 half their present estimated price. It is stated in Mr. Allen's Report, that the Calcutta market was then chiefly supplied from the groves of Shella Púnjí and Bor Púnjí; the produce of the other villages was more perishable, and required to be sold in the neighbouring Districts. The fruit is known in Calcutta as 'Sylhet oranges.' The Bengal registration returns for 1876-77 show a total export from Sylhet of 64,505 *maunds* of 'fruit,' valued at Rs. 193,515, or £19,351.

439 The export of raw cotton appears to have greatly increased. In 1876-77 the total quantity exported was 36,000 *maunds*, valued at Rs. 216,000, or £21,600, at the rate of Rs. 6 per *maund*. Twenty years before the export had been only 12,000 *maunds*, valued at Rs. 42,000, at the rate of only Rs. 3. 8 per *maund*. The cotton is of inferior quality, with a short and woolly staple. It is chiefly consumed by the Sylhet weavers. The total registered export from that District in 1876-77 was only 4300 *maunds*, valued at Rs. 64,500,
434 at the high rate of Rs. 15 per *maund*.

439 The chief article of import now, as twenty years ago, is rice; for
[178] the hill-men have never grown sufficient for their own consumption,
[243] and the recent establishment of the Civil Station of Shillong has increased the demand. In 1876-77 the total imports of rice were estimated at 205,800 *maunds*, valued at Rs. 720,300, or £72,030, at the rate of Rs. 3. 8 per *maund*. Twenty years ago the imports were nearly as great, viz. 150,000 *maunds*; but the value was only Rs. 225,000, at the rate of Rs. 1. 8 per *maund*, or less than one-half the present value. The chief source of supply is Sylhet District, which sends its surplus to the tea gardens of Cáchár, as well as to these Hills, and also exported, in the year 1876-77, 214,000 *maunds* of rice and 433,100 *maunds* of paddy into Bengal.

The importation of fish (fresh and dried) has enormously increased. In 1876-77 the total amount was 35,900 *maunds*, valued at Rs. 215,400, or £21,540, at the rate of Rs. 6 per *maund*. Twenty years ago the value was only Rs. 20,000, but the quantity is not given. The preparation of dried fish is a flourishing industry in the adjoining District of Sylhet.

The importation of cotton cloth has increased in an almost equal proportion. The value in 1876-77 was Rs. 158,000, or £15,800, as

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

of them, more especially when the latter are situated in places where jungle is dense, and there is fear of attacks from wild animals. In the Lyngam village is to be seen a high bamboo platform some 20 to 30 ft. from the ground, built in the midst of the village, where the elders sit and gossip in the evening. 361

All the villages, Khasi, Wár, Lyngam and Bhoi, swarm with pigs, which run about the villages unchecked. The pigs feed on all kinds of filth, and in addition are fed upon the wort and spent wash of the brewings of country spirit, or rice beer, the latter being carefully collected and poured into wooden troughs. The pigs are of the usual black description seen in India. They thrive greatly in the Khasi villages, and frequently attain extreme obesity. 361 231 274

In the Khasi villages of the high plateaux are often nowadays potato gardens, the latter being carefully protected from the inroads of pigs, calves, and goats by dry dikes surmounted by hedges. 244 417

I noticed an interesting custom at a Bhoi village in Nongpoh of barricading the path leading to the village from the forest with bamboo palisading and bamboo *chevaux de frise* to keep out the demon of cholera. In the middle of the barricade there was a wooden door over which was nailed the skull of a monkey which had been sacrificed to this demon, which is, as amongst the Syntengs, called *kkiaw*. 757 776 782

FURNITURE AND HOUSEHOLD UTENSILS.

As in the case of houses, so with reference to furniture, the influence of civilization shows many changes. The Khasi of the present day who lives in Mawkhar * has a comfortable house regularly divided up into rooms in the European style with even some European articles of furniture, but owing probably to the influence of the women, he still possesses several of the articles of furniture which are to be met with in the houses of those who still observe the old style of living. Let us take the furniture of the kitchen to begin with. Above the hearth is slung by ropes of cane a swinging wooden framework 352 352 417

* Mawkhar is a suburb of Shillong, the headquarters station.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

(*ki thiar*). The paddy-fields are not manured. The Khasis, 243
when cultivating high lands, select a clayey soil if they can. In the early part of the winter the sods are turned over with the hoe, and they are exposed to the action of the atmosphere for a period of about two months. When the sods are dry, they are placed in piles, which are generally in rows in the fields, and by means of ignited bunches of dry grass within the piles a slow fire is kept up, the piles of sods being gradually reduced to ashes. This is the "paring and burning process" used in England. The ashes so obtained are then carefully raked over the field. Sometimes other manure is also applied, but not when paddy is cultivated. The soil is now fit to receive the seed, either high-land paddy, millet, Job's tears, or other crops, as the case may be. The homestead lands are plentifully manured, and consequently, with attention, produce good crops. They are cultivated with the hoe.

The cultivation of oranges in the southern portion of the 244
district ranks equally in importance with that of the potato in 245
the northern. The orange, which is known in Calcutta as the Chhatak or Sylhet orange, comes from the warm southern slopes of the hills in this district, where it is cultivated on an extensive scale. Although oranges do best when there is considerable heat, they have been known to do well as high as 3,000 ft.; but the usual limit of elevation for the growth of oranges in this district is probably about 1,000 to 1,500 ft. The orange of the Khasi Hills has always been famous for its excellence, and Sir George Birdwood, in his introduction to the "First Letter Book of the East India Company," page 36, refers to the orange and lemon of Garhwál, Sikkim, and Khasia as having been carried by Arab traders into Syria, "whence the Crusaders helped to gradually propagate them throughout Southern Europe." Therefore, whereas the potato was im- [77]
ported, the orange would appear to be indigenous in these hills.

Nurseries.—The seeds are collected and dried by being 247
exposed to the sun. In the spring nurseries are prepared, the ground being thoroughly hoed and the soil pulverized as far as possible. The nursery is walled with stones. The seeds are then sown, a thin top layer of earth being applied. The

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

247 nurseries are regularly watered, and are covered up with layers of leaves to ensure, as far as possible, the retention of the necessary moisture. When the plants are 3 or 4 in. high, they are transplanted to another and larger nursery, the soil of which has been previously well prepared for the reception of the young plants.

245 An orangery is prepared in the following manner:—

The shrubs, weeds and small trees are cut down, leaving only the big trees for the purpose of shade. The plants from the nurseries are planted from 6 ft. to 9 ft. apart. When they have become young trees, many of the branches of the sheltering trees mentioned above are lopped off, so as to admit the necessary amount of sunlight to the young orange trees. As the orange trees increase in size, the sheltering trees are gradually felled. The orchard requires clearing of jungle once in spring and once in autumn. The Khasis do not manure their orange trees, nor do they dig about and expose the roots. The [436] price of orange plants is from 75 to 100 plants per rupee for plants from 1 to 2 ft. in height, and from fifty to seventy-five plants per rupee for plants from 2 to 5 ft. in height. Orange trees bear fruit when from five to eight years old in ordinary soils. In very fertile soils they sometimes bear after four years. A full-grown tree yields annually as many as 1,000 438 oranges, but a larger number is not unknown. The larger portion of the produce is exported from the district to the plains, and to fruit markets at the foot of the hills such as Theria, Mawdon, and Phali-Bazar, on the Shella river, whence it finds its way to the Calcutta and Eastern Bengal markets.

244 Potatoes are raised on all classes of land, except *hali*, or wet paddy land. When the land has been properly levelled and hoed, drains are dug about the field. A cultivator (generally a female), with a basket of seed potatoes on her back and with a small hoe in her right hand, digs holes and with the left hand drops two seed-potatoes into each hole. The holes are about 6 in. in diameter, 6 in. deep, and from 6 to 9 in. apart from one another. Another woman, with a load of manure in a basket on her back, throws a little manure over the seed in the hole, and then covers both up with earth.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

After the plants have attained the height of about 6 in., they are earthed up. When the leaves turn yellow, it is a sign that the potatoes are ripe. The different kinds of sweet potatoes grown and the yam and another kind of esculent root—*u sohphlang* (*flemingia vestita Benth.*) will be noticed under the head of "Crops." 244

The Khasis possess very few agricultural sayings and proverbs, but the following may be quoted as examples:— 241 538

(1) *Wat ju ai thung jingthung ne bet symbai ha uba sniew kti.*

Do not allow plants to be planted or seeds to be sown by one who has a bad hand. [777]

As elsewhere, there is a belief amongst the Khasis that some people's touch as regards agriculture is unlucky. [826]

(2) *Thung dieng ne bet symbai haba ngen bnai, ym haba shai u bnai.*

Plant trees or sow seeds not when the moon is waxing, but when it is on the wane.

(3) *Wei la saw bha ka bneng sepngi jan miet phin sa ioh jingrang lashai.*

A red sky in the west in the evening is the sign of fine weather to-morrow.

Cf. our English proverb "a red sky in the morning is a shepherd's warning, a red sky at night is a shepherd's delight."

CROPS.

The varieties of rice found in the Khasi Hills are divided into two main classes, one grown as a dry crop on high lands, and the other raised in valleys and hollows which are artificially irrigated from hill streams. The lowland rice is more productive than that grown on high lands, the average per acre of the former, according to the agricultural bulletin, as ascertained from the results of 817 experimental crop cuttings carried out during the fifteen years preceding the year 1898, being 11.7 maunds of paddy per acre, as against an average of 9.4 maunds per acre (resulting from 667 cuttings made during the 243 433

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

243 same period) for the latter.* The average out-turn of both
433 kinds is extremely poor, as compared with that of any description of rice grown in the plains. The rice grown in the hills is said by the Agricultural Department to be of inferior quality, the grain when cleaned being of a red colour, and extremely
244 coarse. The cultivation of potatoes is practically confined to the Khasi Hills, there being little or none in the Jaintia Hills. The normal out-turn of the summer crop sown in February and harvested in June is reported by the Agricultural Department to be five times the quantity of seed used, and that of the winter crop, sown in August and September on the land from which the summer crop has been taken, and harvested in December, twice the quantity of seed. The winter crop is raised chiefly for the purpose of obtaining seed for the spring sowings, as it is found difficult to keep potatoes from the summer crop in good condition till the following spring. The usual quantity of seed used to the acre at each sowing is about 9 maunds, so that the gross out-turn of an acre of land cultivated with potatoes during the year may be taken at 63 máunds, and the net out-turn, after deducting the quantity of seed used, at 45 maunds. The above estimate of the Agricultural Department rests chiefly on the statements of the cultivators, and has not been adequately tested by experiment.

244 Since the appearance of the potato disease in 1885-86 there
439 has been a great decrease in the area under potato cultivation. In 1881-82 the exports of potatoes from the district were as high as 126,981 maunds. From 1886-87 the exports began annually to decrease until in 1895-96 the very low figure of 8,296 maunds was reached. The figures of export for the last nine years are as follows :—

1896-97	16,726 maunds.
1897-98	7,805 "
1898-99	9,272 "
1899-00	5,422 "
1900-01	29,142 "
1901-02	38,251 "
1902-03	36,047 "
1903-04	50,990 "

* See Bulletin No. 5 of the Agricultural Department of Assam, 1898, pp. 4 and 5.

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

It will be seen that in the three years following the earthquake of 1897 the exports fell very low indeed. Since 1901 the trade has been steadily recovering, and the exports of 1904 reached half a lakh of maunds. 241 439 731

It will be observed that there has been some improvement, but the exports are still not half what they were in 1881-82. 244 There are two kinds of sweet potatoes grown in the district, the Garo potato (*u phan Karo*), which appears to have been introduced from the Garo Hills, and *u phan sawlia*, the latter being distinguished from the Garo potato by its having a red skin, the Garo potato possessing a white skin. These kinds of potato are planted on all classes of land except *hali*, they do best on jhumed and homestead lands. The yam proper (*u phan shynreh*) is also largely grown. The small plant with an edible root called by the Khasis *u sohphang* (*flemingia vestita Benth.*), is also largely grown. The roots of the plant after being peeled are eaten raw by the Khasis. As far as we know, this esculent is not cultivated in the adjoining hill districts. Job's tears (*coix lachryma-Jobi*) * are extensively grown, and 243 are planted frequently with the *sohphlang* mentioned above. This cereal forms a substitute for rice amongst the poorer cultivators. Maize or Indian corn (*u riew hadem*) is grown frequently, thriving best on homestead land, and requires heavy manuring; it is grown in rotation with potatoes. Next in importance to rice comes the millet (*u krai*), as a staple of food amongst the Khasis. There are three varieties of millets generally to be seen in the Khasi Hills:—*u 'rai-soh* (*setaria Italica*), *u 'rai-shan* (Paspalum sanguinale), and *u 'rai-truh* (Eleusine coracana). *U 'rai-shan* is cultivated in rotation with the potato, *u 'rai-soh* and *u 'rai-truh* are generally cultivated on jhumed land, where they thrive well. Millet is sometimes used instead of rice in the manufacture of spirit by the Khasis; [274] *u rymbai-ja* (*phaseolus calcaratus*), and *u rymbai ktung* (*glycine soja*) are beans which are cultivated occasionally. Khasis highly prize the fruit of the plantain, which they give to infants 245 mashed up. The following are the best known varieties:— 853 *Ka kait khún, ka kait siem, ka kait kulbuit, ka kait bamon, ka kait shyieng.*

* Khasi *u soh-riew.*

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi–Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional custom nor a simple blueprint of ill-fitting all-India legislation. The major political schism at this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. [Cf. Gait 1926; Aitchison 1931; Bhuyan 1949; Morris 1910.]

175 619 648 [726] [651] [177] 177 648 244 439 134 797 428 635 633 167 563 423 [873] 648 642 [651] [563] [113]

SETTLEMENT PATTERN AND HOUSING. **Settlement pattern.** Khasis live sedentarily in named, nucleated, and unplanned villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

361 [312]

Uptill now the main sources of forest revenue in the district are timber, limestone, lac, bay leaf and elephants. 13

2.6 **Agriculture.**—The greater proportion of population of the district subsist on agriculture. The staple crops raised in the district are wet and dry rice, various kinds of millets, maize, potatoes, pineapples, oranges, arecanut, betel-leaf and bay leaf. To a smaller extent they grow in the gardens round their houses vegetables, pulses and occasionally sugarcane. 24

2.6.1 **The main crops : Rice.**—While wet rice is grown in the valleys with which the hills are intersected, dry rice is grown on the hill sides. Highland rice is seldom grown twice running on the same spot for after one crop the soil is exhausted and a fallow period of four to five years is usually allowed. Jowai subdivision is predominantly a wet rice producing area. In Shillong subdivision main wet rice pockets are the Bhoi area stretching upto the sung valley and the northern portion of the plateau, the Mylliem state, the south-western portion of the district and the southern plain portion of the district adjoining East Pakistan. Dry rice is grown more or less through out the district. While Jowai subdivision can claim self sufficiency in rice, Shillong subdivision is a deficit area and the people in this subdivision particularly those in the southern portion (border area) of the district have to depend on supplies from outside. Though there is no reliable statistices of the area under rice, a rough estimate is given elsewhere in the land utilisation table. 243

Maize and millet.—are two important food crops of the district grown more or less throughout the district.

Potatoes are extensively grown in the higher slopes and in the lower land which are well drained. Generally two crops of potatoes are raised annually in the district. In respect of production and export of potato this district occupies the topmost position in the State of Assam. 244

Orange, betel leaf and arecanut are most extensively grown in the southern base of the hills, *i.e.* all over the border areas. Oranges are also grown in Bornihat areas, in the northern portion of the district. Orange and betelnut plantations extend from the foot of the hills to a height of about 1500 feet and are carried up the ravines which score the southern face of the high plateau. The district is an important producer of Bay-leaf which is abundantly found in the border areas of the district. Other valuable cash crops of the district are black pepper, turmeric, chillies, ginger, pineapple and various other fruits. 245

2.6.2 **Agricultural seasons.**—For wet rice, the lands which are naturally irrigated by virtue of their very location, are ploughed or hoed by about the middle of February and seed sown in May or June. Harvesting takes place in October and November. For dry rice, the land is hoed by about the middle of September, the solds are collected into little heaps and burnt and by February the land is again hoed up and the seed sown in April - May. Harvesting goes 243

243 on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in
244 April-May and ripens in August - September. For potato, generally three crops are raised in the district ; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

245 For oranges and betelnut the orchards are cleared of weeds twice a year. Harvesting of orange takes place from October to January. Betelnut ripens at the beginning of the year and are collected between February and May.

241 2.6.3 **Agricultural implements.**—The usual agricultural implements are a hoe, a sickle, three or four kinds of doas, a harrow, a crowbar which is used for the construction of irrigation channels, 'sierras' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and resembles the one in use in the plains of the State.

2. 6. 4. **General cultural practices.**—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

433 2.7 **Cottage Industries.**—Cottage Industries, it appears, have not
326 found very great favour among the people of the district. A few
[323] families here and there manufacture iron implements, earthenware,
285 pottery, baskets, mats and jewellery. In striking contrast with other
[306] districts weaving of cotton clothes is rare among the Khasis. The
286 Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir
[171] Hills practice it only for their domestic consumption. At present, the
[654] Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries
[231] production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

142 2.8 **The People.**—The Khasis and Jaintias are a short sturdy
147 race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free
441 from any inhibition. Side by side with the Khasis live the Mikirs, Garos-
563 and Nepalis who form respectively 7.32 percent, 3.38 percent and 3·27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

241 2.9 **Occupation.**—The greater portion of the population of the
[433] district subsists on cultivation. More than 75 percent of the rural
[461] households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

8·5—In the following paragraphs we have reproduced the yield rates of different crops, calculated on the basis of area harvested and total produces reported by the cultivators. For assesment of correct yield rates it is necessary to conduct a scientifically designed crops cutting survey which in view of its largeness in magnitude and other complexities associated with the type of experiments, could not be fitted in with the programme of the present survey. It is admitted that the yield estimates worked out by us are proved to be subjected to the usual limitations of this type of data. 128 433

Yield

1. **Paddy.**—It will be seen from table above that average yields of paddy per acre for Border area, General area and Project area are respectively 8.38 maunds, 12.92 maunds and 12.60 maunds and for the district as a whole it comes to 11.65 maunds though there are cases where maximum yield goes to above 18 maunds per acre. Thus it is seen that the average yield is much less than the average yield for the State of Assam (plain district) which is above 18 maunds per acre. Average yield in Border area is evidently much smaller. Apart from low fertility of land, another reason for this low average is that in a number of villages selected from Border area such as Syndai, Amki and Lumshnong, there was widespread havoc to standing crops was caused by wild elephants. 243 433 [136]

2. **Potato.**—The average for the three areas comes to 21·61 maunds per acre which is in contrast to the State average of above 40 maunds per acre. Our estimate has in fact been lowered due to inclusion of a few villages in the foot hills where potatoes don't grow well, otherwise in a number of high altitude villages, yield per acre well exceeded 40 maunds. The average for Border area is rather too low. Apart from unsuitability of Border land of high altitude potatoes another reason for this low average is that during the reference year the crop suffered from widespread incidence of pests and insects. 244 433 [136]

3. **Orange.**—yield of orange in Border area, Project area and General area was found to be 5. 27 luties or 5396 numbers against 16.76 luties or 17162 numbers and 2.80 luties or 2867 numbers respectively Thus the average yield in Border area, even considering the mixed nature of some gardens is much low. The reasons are obvious. 245 433

4. **Betelnut**—Average yield per acre from Border area, Project area and General area was found to be 2.93 luties (18752 numbers), 4.11 luties (26304 numbers) ann 3.03 luties (19392 numbers) respectively bringing the average for all the three areas to 2.95 luties per arce. 249 433

5. **Betel leaf.**—Average yield per acre works out at 17·15 kuris, 50.64 kuris and 24 kuris in Border area, Project area and General area respectively. Thus in Booder area the average is much lower. This is due to the fact that most of the gardens remained unplucked for want of market for leaf.

16: McCormack E-4,5 (1956-1958) 1964
[P. 108A] AR7 Khasi AR7

nure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Bhoi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country are paddy rice, lac, caoutchouc, cotton, bananas, and pineapples; in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmiller 1925.] **Gathering.** Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

243 the District, nor do any superior kinds of cereals appear to have been substituted for inferior ones.

THE DIFFERENT STAGES OF RICE CULTIVATION, in English and Khásí, are as follow:—The blade as it first shows, *spch-u-kyba;* the blade when well above the ground, *la-thylleng-u-kyba;* the ears when first formed, *lam-mat;* the ears beginning to ripen, *byr-tem;* the ripe ears, *la-hih;* unhusked rice, *u-kyba;* husked rice, *u-khaw;* cooked rice, *ka-ja.*

262 THE VARIOUS SOLID AND LIQUID PREPARATIONS made from rice
[435] are the following:—(1) *U-kypu*, cakes of different kinds, sold at six or twelve for a penny, according to size. (2) *U-shirá* or *gáh-khir*,
[782] prepared by the hillmen as an offering to their deity at the conclusion of the harvest. (3) *Kadam*, fermented rice water, sold at the rate
273 of from three-farthings to threepence per quart, according to the
435 strength of the liquor. (4) *Ka kiad-phatika* or *ka kiad-hárak*, a kind of spirits distilled from rice, and sold at from threepence to four-pence-halfpenny per quart.

243 OTHER CEREALS.—Indian corn, or *u-riu-ha-dem*, is grown on homestead lands. The ground is first manured, and the seed is sown about the middle of April. The crop is fit for cutting in September and October. A kind of millet seed called *u-krái* is commonly sown with paddy on high lands. For want of more suitable land, however, this crop is often cultivated by itself on rocky slopes; and when this course is adopted, the jungle is first cut down in February and burnt. The seed is sown in April, and the crop gathered in December.

244 PULSES AND FIBRES.—Only two kinds of pulses are grown in the Hills, *u-rym-bai-ktung* and *u-rym-bai-jú*, both of which are varieties
283 of beans. They are sown on high lands in March and April, and gathered in December. The only fibre is that made from the pine-apple stalk, which is largely used for making netted bags.

245 MISCELLANEOUS CROPS.—(1) Oranges.—There are numerous
[439] orange plantations in the neighbourhood of Cherrá Púnjí, and the fruit is exported to all parts of Bengal. In the year 1876-77 the estimated exports were 9,400,000 in number, valued at Rs. 37,600, or £3760, at the rate of Rs. 12 or £1, 4s. per three thousand. These figures show a decrease in number as compared with the estimated export twenty years ago. The trees flower in March or April, and the fruit ripens in October and the following months. In some cases the oranges are allowed to remain on the trees till March, but

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

generally the gathering does not extend beyond January. As a rule, the cultivation is confined to the valleys and slopes on the southern face of the hills. (2) Pine-apples are also largely cultivated on the southern slopes, and grow to great perfection on the limestone formation. The fruit ripens in May or June, and is exported in considerable quantities. In 1876-77 the export of pine-apples was valued at Rs. 8000 or £800. (3) Potatoes are extensively grown on slopes of high land, and also in the low-lying fields where the land is well drained. The tuber was first introduced into the Hills in 1830 by Mr. Scott, who was then the Governor-General's Agent. The season for sowing commences about the middle of February when the rains set in early, and in April when they are late. The ground is dug up and carefully manured with burnt earth, and holes are dug about nine inches deep, and the same distance from each other. These holes are then partially filled in with loose earth, and a potato or two halves of one placed in each. They are then filled up with dry manure and soil. When the plant is fifteen or twenty days old, the ground about the roots is loosened and the plant earthed up, and the land is kept carefully weeded. In about four months after sowing, the crop is gathered. During the cold weather a second crop is raised, the seeds being planted in September and the tubers dug up in December. Potato cultivation has largely increased of late years in the District. In 1876-77 the exports were approximately estimated at 200,500 *maunds*, or 7480 tons, valued at Rs. 501,250 or £50,125, at the rate of Rs. 2. 8 per *maund*, or £7 per ton. (4) Sugar-cane is grown, but not to any great extent; cuttings are planted in March, and the cane ripens by November or December. (5) *Pán* is extensively cultivated, the runner being trained up trees standing in deep and shady valleys. Planting is carried on during the months of April and May, but the leaves are not fit to be gathered till the plant is two years old. (6) The *supári* or betel-nut (Areca catechu), called *u-kwai* by the Khásiás, is grown on the lower southern slopes of the hills, and, together with the *pán* leaf, is consumed in immoderate quantities by the inhabitants, who measure distance by the number of *páns* consumed on a journey. It is also exported to the plains. (7) *U-soh-phlang*, a root crop resembling a small turnip, is sown on high lands in April and gathered in September. It is a poor vegetable, but the natives of the Hills are fond of it, and eat it either raw or cooked. (8) Cotton is grown on high lands and

245 244 [439] [177] [439] 249 244 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

reared either for food or as articles of trade. A pair of ploughing oxen are worth about Rs. 32, or £3, 4s.; an ordinary cow, Rs. 12, or £1, 4s.; a score of kids six months old, Rs. 16, or £1, 12s.; and a score of full-grown pigs, from Rs. 100 to Rs. 160, or from £10 to £16. 231 435

THE AGRICULTURAL IMPLEMENTS in use in the District consist of a plough, called *ka-jing-lúr* in Khási, and a hoe or *kodáli*, called *u-mo-khiw*. When the cultivation is carried on by means of oxen, the plough is used, the hoe alone being used when the land is cultivated by manual labour. In the Khási Hills the use of the plough, except in a few rare cases, is entirely unknown; but in the Jáintiá Hills, oxen and ploughs are used to a greater extent. What is technically termed 'a plough' of land is equivalent to four English acres; a pair of oxen, together with the necessary implements, would represent a capital of about Rs. 40, or £4. 241 407 [435]

WAGES.—The Deputy-Commissioner reports that the price of labour in the District has more than doubled in the last ten years. The rates obtaining at present are from eightpence to one shilling a day for an ordinary labourer, and from one shilling to eighteenpence a day for a porter. An agricultural day-labourer earns sixpence, and a woman at the same work fourpence-halfpenny a day. Bricklayers, carpenters, and blacksmiths earn from a shilling to eighteenpence a day. The new Station of Shillong, the present seat of the Local Government, was established in May 1864, and since that date the demand for labour has markedly increased. The extension of the cultivation of potatoes has also had an appreciable effect on the price of labour. 178 464 465 [244]

PRICES OF FOOD GRAINS.—Of the different descriptions of rice in the markets of the District, the better sorts are imported from the neighbouring Districts of Sylhet and Kámrúp. The local produce is considered fit only for the use of the Khásiás. The price of the better descriptions depends entirely upon the distance from which the supplies come. In a distant market like that of Shillong, rice of the best quality generally sells at from 6 to 7 *sers* for the rupee, or from 16s. to 18s. 8d. per cwt.; and rice of inferior quality, which is only used by the poorer classes, at from 9 to 10 *sers* for the rupee, or from 11s. 2d. to 12s. 5d. per cwt. Little or no trade is carried on in unhusked grain. Paddy produced in the District generally sells at an average of from 15 to 16 *sers* per rupee, or from 7s. to 7s. 6d. per cwt. Indian corn, which is only grown to a small extent, is sold 435 439 243

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

extent of waste land, some is cultivated in a manner resembling the *júm* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *júmid* tenure. Any renting of land is exceptional, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

MANURE is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 2s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 243 244 [435]

IRRIGATION for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

MODEL FARM.—The Shillong Model Farm, established in 1873, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red roughs' and 'pheasant's eye'—were successfully introduced in 1873-74; but these are not looked upon favourably by the Khásiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unfitness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1744 177 244 648 654 177 245 648 654 [134] [136] 231 648 654

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

231 (£174, 8s.) was expended on the purchase of stock, including
648 cattle, sheep, and pigs from England. Even native cattle at the
654 elevation of Shillong fall off very much in the months of January and February from want of forage, and the Khásiás at this season generally drive them to lower slopes. But one of the chief objects in keeping cattle at the farm was to obtain manure; and *mati kaldi* (Phaseolus radiatus) was grown for them, cut green, and stocked
[731] for food. On this they did very well. In 1875-76, however, cattle disease broke out on the farm in a very virulent shape. Out of 39 cattle attacked, only 7, or 18 per cent., recovered, and the animals imported from England all died. There was also a heavy mortality in that year among the sheep and pigs. The following are the financial results for the two years:—1874-75—Expenditure, Rs. 13,297. 0. 5; receipts, Rs. 309. 2. 6: deficit, Rs. 12,987. 13. 11. 1875-76—Expenditure, Rs. 11,445. 8. 6; receipts, Rs. 1036. 15. 0: deficit, Rs. 10,408. 9. 6. Total deficit, Rs. 23,396. 7. 5, or £2339,
648 13s. In view of these figures the Chief Commissioner has deter-
654 mined to restrict farming operations to small experiments in irrigated *rabi* crops, and, as a measure of economy, to dispense with the services of the superintendent. The future expenditure on the farm will be insignificant. The establishment now (1877) consists of a *sardár* on Rs. 50 and a *chaukíddr* on Rs. 10 a month (total, £72 a year), under the direct control of the Deputy-Conservator of Forests; the total number of live-stock is 64 head.

731 NATURAL CALAMITIES, such as blights, floods, or droughts, are not common in the District, although the crops in the Jáintiá Hills sometimes suffer from insects. So far as the Deputy-Commissioner is able to ascertain, no destruction of crops affecting the general harvest has occurred within the experience of the present generation.
[435] During the Orissa famine of 1866-67 the maximum price of common rice reached £1 per hundredweight, but no such distress was felt as to require Government relief operations. The price just mentioned was certainly equal to the rates prevalent in the famine-stricken localities; but prices always rule high in the Hills, and afford no just criterion of the state of affairs among the general body of the inhabitants. Distress was only felt by a small portion of the population, chiefly the Bengálí immigrants residing in the District,
262 who are generally a well-to-do class. The Hill people, as a rule, do
244 not eat potatoes, which they grow only for export; but in case of actual famine, they might fall back upon this crop for their own food
439 supply.

Text continued from page 238.]

This price is about the same as it was twenty years ago, but the quantity has increased fourfold. The potato was first introduced into the Hills in 1830 by Mr. David Scott, who was then the Governor-General's Agent. 'No greater boon could have been conferred upon the people.' The local trade is entirely in the hands of the Khásiás themselves, and the larger portion of the produce is despatched direct to Calcutta. According to the registration returns of river traffic in Bengal, the export of provisions (including vegetables) from Sylhet in 1876-77 was 123,108 *maunds*, valued at Rs. 369,324, or £36,932, at the rate of Rs. 3 per *maund*.

[177]
[244]

The export of oranges in 1876-77 was 9,400,000 in number, valued at Rs. 37,600, at the rate of Rs. 12 per 3000. These figures apparently show a great decrease since 1858. At that time Mr. Inglis possessed the entire monopoly of the trade, by means of the leases which he held from the Khási Chiefs of all the valuable groves. The annual produce of his groves was estimated at forty-five millions of oranges, having increased from eleven millions within the

439
434
245
648

1;Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

137 and other trees. These are the sacred groves. Here the
778 villagers worship *U ryngkew U basa*, the tutelary deity of
the village. These groves are taboo, and it is an offence to cut
[776] trees therein for any purpose other than for performing funeral
361 obsequies. The groves are generally not more than a few
137 hundred yards away from the villages. The villages of the
Syntengs are similar in character to those of the Khasis. The
245 Wár villages nestle on the hill-sides of the southern border, and
are to be seen peeping out from the green foliage with which
the southern slopes are clad. In the vicinity of, and actually
up to the houses, in the Wár villages, are to be observed large
groves of areca-nut, often twined with the *pan* creeper, and
of plantain trees, which much enhance the beauty of the scene.
Looking at a Wár village from a distance, a darker shade of
green is seen; this denotes the limits of the extensive groves
where the justly celebrated Khasi orange is grown, which is the
361 source of so much profit to these people. The houses in the
Wár villages are generally closer together than those of the
Khasis, probably owing to space being limited, and to the
[363] villages being located on the slopes of hills. Generally up the
narrow village street, and from house to house, there are rough
steep stone steps, the upper portion of a village being frequently
situated at as high an elevation as 200 to 300 ft. above the
lower. In a convenient spot in a Wár village a clear space is
to be seen neatly swept and kept free from weeds, and sur-
rounded with a stone wall, where the village tribunals sit, and
the elders meet in solemn conclave. Dances also are held here
778 on festive occasions. At Nongjri village there is a fine rubber
796 tree, under whose hollow trunk there are certain sacred stones
where the priest performs the village ceremonies.

361 The Bhoi and Lynngam villages are built in small clearings
in the forest, the houses are close together and are built often
[363] in parallel lines, a fairly broad space being reserved between
[351] the lines of houses to serve as a street. One misses the pretty
gardens of the Wár villages, for Bhois and Lynngams attempt
nothing of the sort, probably because, unlike the Khasi, a Bhoi
or Lynngam village never remains more than two or three years
in one spot; generally the villages of these people are in the
vicinity of the forest clearings, sometimes actually in the midst

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

(*ki thiar*). The paddy-fields are not manured. The Khasis, when cultivating high lands, select a clayey soil if they can. In the early part of the winter the sods are turned over with the hoe, and they are exposed to the action of the atmosphere for a period of about two months. When the sods are dry, they are placed in piles, which are generally in rows in the fields, and by means of ignited bunches of dry grass within the piles a slow fire is kept up, the piles of sods being gradually reduced to ashes. This is the "paring and burning process" used in England. The ashes so obtained are then carefully raked over the field. Sometimes other manure is also applied, but not when paddy is cultivated. The soil is now fit to receive the seed, either high-land paddy, millet, Job's tears, or other crops, as the case may be. The homestead lands are plentifully manured, and consequently, with attention, produce good crops. They are cultivated with the hoe. 243

The cultivation of oranges in the southern portion of the district ranks equally in importance with that of the potato in the northern. The orange, which is known in Calcutta as the Chhatak or Sylhet orange, comes from the warm southern slopes of the hills in this district, where it is cultivated on an extensive scale. Although oranges do best when there is considerable heat, they have been known to do well as high as 3,000 ft.; but the usual limit of elevation for the growth of oranges in this district is probably about 1,000 to 1,500 ft. The orange of the Khasi Hills has always been famous for its excellence, and Sir George Birdwood, in his introduction to the "First Letter Book of the East India Company," page 36, refers to the orange and lemon of Garhwál, Sikkim, and Khasia as having been carried by Arab traders into Syria, "whence the Crusaders helped to gradually propagate them throughout Southern Europe." Therefore, whereas the potato was imported, the orange would appear to be indigenous in these hills. 244 245

Nurseries.—The seeds are collected and dried by being exposed to the sun. In the spring nurseries are prepared, the ground being thoroughly hoed and the soil pulverised as far as possible. The nursery is walled with stones. The seeds are then sown, a thin top layer of earth being applied. The 247

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

247 nurseries are regularly watered, and are covered up with layers of leaves to ensure, as far as possible, the retention of the necessary moisture. When the plants are 3 or 4 in. high, they are transplanted to another and larger nursery, the soil of which has been previously well prepared for the reception of the young plants.

245 An orangery is prepared in the following manner :—

The shrubs, weeds and small trees are cut down, leaving only the big trees for the purpose of shade. The plants from the nurseries are planted from 6 ft. to 9 ft. apart. When they have become young trees, many of the branches of the sheltering trees mentioned above are lopped off, so as to admit the necessary amount of sunlight to the young orange trees. As the orange trees increase in size, the sheltering trees are gradually felled. The orchard requires clearing of jungle once in spring and once in autumn. The Khasis do not manure their orange trees, nor do they dig about and expose the roots. The [435] price of orange plants is from 75 to 100 plants per rupee for plants from 1 to 2 ft. in height, and from fifty to seventy-five plants per rupee for plants from 2 to 5 ft. in height. Orange trees bear fruit when from five to eight years old in ordinary soils. In very fertile soils they sometimes bear after four years. A full-grown tree yields annually as many as 1,000 438 oranges, but a larger number is not unknown. The larger portion of the produce is exported from the district to the plains, and to fruit markets at the foot of the hills such as Theria, Mawdon, and Phali-Bazar, on the Shella river, whence it finds its way to the Calcutta and Eastern Bengal markets.

244 Potatoes are raised on all classes of land, except *hali*, or wet paddy land. When the land has been properly levelled and hoed, drains are dug about the field. A cultivator (generally a female), with a basket of seed potatoes on her back and with a small hoe in her right hand, digs holes and with the left hand drops two seed-potatoes into each hole. The holes are about 6 in. in diameter, 6 in. deep, and from 6 to 9 in. apart from one another. Another woman, with a load of manure in a basket on her back, throws a little manure over the seed in the hole, and then covers both up with earth.

1: Gurdon E-4,5 (no date) 1907 AR7 Khasi AR7

It will be seen that in the three years following the earthquake of 1897 the exports fell very low indeed. Since 1901 the trade has been steadily recovering, and the exports of 1904 reached half a lakh of maunds. 241 437 731

It will be observed that there has been some improvement, but the exports are still not half what they were in 1881-82. 244 There are two kinds of sweet potatoes grown in the district, the Garo potato (*u phan Garo*), which appears to have been introduced from the Garo Hills, and *u phan saudia*, the latter being distinguished from the Garo potato by its having a red skin, the Garo potato possessing a white skin. These kinds of potato are planted on all classes of land except *kali*, they do best on jhumed and homestead lands. The yam proper (*u phan shyarek*) is also largely grown. The small plant with an edible root called by the Khasis *u sakphang* (*Coleus esculentus Benth.*), is also largely grown. The roots of the plant after being peeled are eaten raw by the Khasis. As far as we know, this esculent is not cultivated in the adjoining hill districts. Job's tears (*coix lachryma-Jobi*)* are extensively grown, and 243 are planted frequently with the *sakphlang* mentioned above. This cereal forms a substitute for rice amongst the poorer cultivators. Maize or Indian corn (*u rice hadem*) is grown frequently, thriving best on homestead land, and requires heavy manuring; it is grown in rotation with potatoes. Next in importance to rice comes the millet (*u krai*), as a staple of food amongst the Khasis. There are three varieties of millets generally to be seen in the Khasi Hills:—*u 'rai-sak* (*setaria Italica*), *u 'rai-shan* (Paspalum sanguinale), and *u 'rai-trah* (Eleusine coracana). *U 'rai-shan* is cultivated in rotation with the potato, *u 'rai-sak* and *u 'rai-trah* are generally cultivated on jhumed land, where they thrive well. Millet is sometimes used instead of rice in the manufacture of spirit by the Khasis; [274] *u rymbai-ja* (*phaseolus calcaratus*), and *u rymbai khang* (*glycine soja*) are beans which are cultivated occasionally. Khasis highly prize the fruit of the plantain, which they give to infants 245 853 mashed up. The following are the best known varieties:—*K'a kait khán, ka kait siem, ka kait kulbait, ka kait bamon, ka kait shyieng.*

* Khasi *u sak-rice.*

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

245 The most important crop on the southern side of the hills is the orange, which has already been referred to in the paragraph dealing with agriculture.

The oranges are sold by the *spak* or 100, which is not a 100 literally, but somewhat over 3,000 oranges. Different places have different *spaks*. At Phali Hat, on the Bogapani River, the *spak* is computed as follows:—

1 Hali = 4 oranges.
8 Holis = 1 Bhar.
100 Bhars = shi spak (one hundred).
= 3,200 oranges.

At Shella the computation is slightly different, being as follows:—

1 Gai = 6 oranges.
5 Gais + 2 oranges = 32 oranges.
4 Bhars = 1 hola = 128 oranges.
27 holas + 2 bhars = shi spak (100)
= 3,520 oranges.

By another method of calculation the *spak* consists of 3,240 oranges.

[435] The price per *spak* varies from about 10 rupees in good years to Rs. 40, when the orange harvest has been a poor one.

245 The lime is also cultivated, not separately, but along with the orange. The lime can be grown with success at a higher altitude than the orange. There is extensive betel-nut and *pân* cultivation on the southern slopes of the hills. The betel-nut tree is cultivated in the same manner as in the plains, except that the trees are planted nearer to one another. The trees bear when eight to ten years old. A portion of the crop is sold just after it has been plucked; this is called u *'wái khlar*, and is for winter consumption. The remainder of the crop is kept in large baskets, which are placed in tanks containing water, the baskets being completely immersed. This kind of betel-nut is called u *'wái um*. The Khasis, like the Assamese, prefer the fresh betel-nut. They do not relish the dry *supari* so much.

The principal *pân* gardens are on the south side of the hills, *pân* not being grown on the northern slopes, except in the neighbourhood of Jirang. The *pân* creepers are raised from cuttings, the latter being planted close to the trees up which they are to be trained. The creeper is manured with leaf

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

mould. The plant[1] is watered by means of small bamboo 245
aqueducts which are constructed along the hill-sides, the water [312]
being conducted along them often considerable distances. As in the plains, the leaves of the *pán* creeper are collected throughout the year.

The bay leaf (*'la tyrpád*, or *tezpát*) is classified in the *Agricultural Bulletin* as *Cinnamomum tamala*, and there is a note in the column of remarks that "this tree, as well as one or two others of the same genus, yields two distinct products, *tezpát* (bay leaf) and cinnamon bark." The bay leaf is gathered for export from the extensive gardens in Maharam, Malaisohmat, [439]
Mawsynram, and other Khasi States. The plants are raised from seed, although there are no regular nurseries, the young seedlings being transplanted from the jungle, where they have germinated, to regular gardens. Bay leaf gardens are cleared of jungle and weeds periodically; otherwise no care is taken of them. The leaf-gathering season is from November to March. The leaves are allowed to dry for a day or two in the sun, and then packed in large baskets for export. The gathering of bay leaf begins when the trees are about four years old.

The following are the other minor crops which are grown in the Khasi and Jaintia Hills:—

Pineapples, turmeric, ginger, pumpkins and gourds, the egg 249
plant, chillies, sesamum, and a little sugar-cane. The arum* [262]
(*la shirie*) is also extensively grown in the hills, and forms one of the principal articles of food amongst the poorer classes; it is generally raised in rotation with potatoes, or is planted along with Job's tears. The stem of the arum is sometimes [231]
used as a vegetable, also for feeding pigs.

In the Jowai Sub-Division, notably at Nartiang, there are fairly good mangoes, which are more free from worms than those grown in the plains of Assam.

The Bhois and Lynngams cultivate lac. They plant *arhar* 231
dal, a *landeo*, in their fields, and rear the lac insect on this 435
plant. Last year the price of lac at Gauhati and Palasbari markets rose as high as Rs. 50 per maund of 82 lbs., it is said, but the price at the outlying markets of Singra and Boko was

* Colocasia esculenta, Beng. *Kachu*. 137

[1] [i.e., the pán .... Anal, 71]

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

—the *Shyngkup*, or porch, being flush with the ground. The *nengpei*, or 342
centre room, is approached by a flight of steps. There are no windows, except one, which is bored on one side to admit light and air,—this is called the *pongshai*. Both Khasis and Syntengs, like other Indo-Chinese 524
races, are much addicted to gambling, and drinking to excess is a 273
national vice. Christianity has, through the agency of the Welsh Cal- 797
vinistic Mission, gained a very striking extension, and may be said in- 177
deed to be leavening the whole nation. Schools are numerous, and are pretty well attended by girls as well as boys. The Christians, and those who have come under the influence of Christianity, have adopted a high standard of comfort, and their houses resemble English cottages more nearly than the huts with which one is familiar in India.

Agriculture.—The Khasis do not use the plough; they cultivate their 241
fields with a peculiar-shaped hoe, or *mokkhiew*. They cultivate rice in the valleys, the rice being sown broadcast and the fields irrigated often after considerable labour. They also cultivate hill rice on the uplands, which they sow broadcast. The potato, which was introduced into the [177]
Khasi Hills by Mr. David Scott about the [439]
year 1830,[1] is extensively cultivated and forms one of the principal articles of export. Job's-tears (*Coix lachryma*), several kinds of millet, Indian-corn, the *Sohphlang* (*Flemingia vestita*), are also largely cultivated. The valleys on the 245
southern slopes of the hills have extensive orange groves, the oranges, especially those grown in the neighbourhood of Shella, being famous for their quality. The betel, vine, and areca nut are also largely grown on the southern side of the hills and in the low valleys, these plantations being irrigated by elaborate systems of aqueducts. The leaf of the bay tree (*Tatyrpad*) is collected, and is exported to the Sylhet plains. The [439]
Syntengs differ from the Khasis, in that they make use of the plough. Both Khasis and Syntengs are industrious cultivators, and they possess a certain rough and ready knowledge of the uses of manure. A more detailed description of agriculture in these hills will be given in the monograph.

[1] Khasi and Jaintia Hills Administration Report for 1875-76 by Colonel Bivar.

2. *Matriarchal customs and law of inheritance of property.*—The 611
mother is the head of the house, and is both owner and the custodian of 428
the family property as long as she lives. Males can own no property amongst either Khasis or Syntengs except self-acquired property. On the death of the mother, in the case of the Khasis, the family property passes to the youngest daughter. According to some authorities, however, the property would in practice be divided amongst all the surviving daughters. Failing daughters, the property passes to the youngest niece, and failing a niece, to the youngest female cousin. The same

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

CHAPTER II

VILLAGE COMMUNITY

As models of a Khasi village community, I have taken my data for the discussion presented in this chapter from two villages situated in the Kadashinong area, Sohkynduh and Kongton, with comparative data from Shella and Jatinga villages. 121

Sohkynduh and Kongton are situated in one of the most secluded spots of the Khasi Hills and the economy is shifting cultivation, with millet as its main product. Only a few Christians are found; most of the population are pagans. Shella is situated on the southern border of the Khasi Hills, adjacent to Pakistan. Jatinga is in the North Cachar Hills, surrounded by patrilineal tribes, such as the Zemi-Naga, the Kuki and the Cacharee. The economy of both villages is pan-leaf and orange cultivation. In Shella, Hindu, Christian and pagan are found among the villagers almost in the same proportions, while the Jatinga villagers are all Christian. The two Kadashinong villages, Shella and Jatinga, differ from one another not only in their religious and economic aspects, but in overt culture, dialect and political organization as well. (Additional information concerning Shella and Jatinga is given in Appendix.) Shella and Jatinga are unique among Khasi villages and quite sophisticated, having been developed under a trading economy, with considerable contacts with other peoples, including Hindus. I selected these villages in order to ascertain how far the structural principle which operates in the Kadashinong villages can be found to act also in totally different economic and environmental situations. 621 771 [101] [245] 184 621 121

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

there are none of their descendants in Jatinga. Summing up, the first party who settled at Jatinga was composed of people of the following five clans: 166 551

1. Suchiang — Lakhanbang, his sister, Laptho, and her daughter, Kloribon, his brother, Pryntah. 614
2. Suchen — Munik and his younger brother, Sain. 621
3. Phanwar — Misibon and her younger sister, Diasibon. 175
4. Rupsi — Sintu, the wife of Pryntah.
5. Suiam — Tahin, the wife of Sain.

Among them, Suchen had no female member. Phanwar had no successor: Misibon had no issue and Diasibon did not marry. Therefore, Suchiang, Rupsi and Suiam are the oldest clans in present Jatinga. Suchiang and Rupsi especially are the dominant and richest groups among the present population.

This was the time when the railway from Gauhati to Silchar was being constructed. Some Khasi labourers were working at Haflong on the construction of the railway. After the foundation of Jatinga, these Khasi workers established marriage relations with the Khasi of Jatinga, and finally, upon completion of the railway, many of them became the inhabitants of Jatinga. The present members of the Dome and Siangshai clans are the descendants of these people, and they form a considerable number of the present inhabitants of Jatinga. Besides them, there were a few other Khasi at Haflong who were engaged in trading business. In the course of time, they also had marital relations with Jatinga people and came to Jatinga. 166 175 458 621 [499] [464]

After five years had elapsed they found that in spite of their hard work the land was not favourable to them. Many of them left Jatinga. This was the hardest period of Jatinga history.

The second migration (1919-1925).

The railway which once had been blocked was reopened in 1919. The people who had left Jatinga came back to settle there. This time the circumstances seemed to them quite favourable. The pan trees which they had planted earlier were growing and they could gather considerable produce. The village grew bigger around 1920 as a result of new immigrants from Jaintia; most of them were people from Bataw, the village of the founder. In this period, many immigrants came from Jaintia not only to Jatinga but also to Sylhet, Borkhala and other places outside the Khasi-Jaintia Hills. It seems that by this time the over-populated Jaintia realised that these areas were favourable for their new home. However, the successive waves of Jaintia immigrants to Jatinga ceased by 1925, its population having reached saturation point. [499] [245]

Orange production brought economic prosperity to the people of Jatinga. Wealthy villagers employed temporary labourers from the Jaintia Hills every year. Some of these labourers came with their families and others came individually. During their stay at Jatinga, some of them married and settled there. Hence, there are also descendants of such labourers among the present inhabitants of Jatinga. [245] [464]

Some Aspects of Descent Groups.

Throughout the history of Jatinga, immigrations have always been undertaken by a family (elementary family, siblings) or by an individual, but never by a group of clan members. Therefore, the present population is grouped in small descent groups according to each migration. Though some of them happened to have the same clan name, their history of migration and their 621 [175] [614] [166]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 like the Zemi-Naga, the Cacharee and the Kuki. But after the period of
563 economic prosperity as I shall describe in the next section, the Jatinga people
621 reached a rather high level of education, while most of the neighbouring tribes
[871] remained illiterate. Their standard of living likewise improved. Fashionable girls of Jatinga who have studied at the Convent school in Shillong, and speak English and Hindi, cannot marry half-naked tribesmen who work in the jungle. They prefer to intermarry with Moslem, Panjabee or Assamese who belong to amore sophisticated community, and through whom they can enjoy urban life. Thus the orientation of the intermarriage of the people of Jatinga has changed, along with the growth of Jatinga.

It should be noted that intermarriages came mostly through the contacts at Haflong, where people used to go once a week for the bazaar, rather than through direct contacts with neighbouring villages.

Economy of Jatinga and its Relation to Neighbouring Tribes.

178 It is very interesting to find two different kinds of economy in the same
171 ecological background: Jatinga Khasi practise pan-leaf and orange cultivation
245 and depend mainly on a trading economy, while the other neighbouring tribal peoples practise jhum cultivation, almost a subsistence economy. This situation has remained unchanged for the last fifty years since the establishment of Jatinga village.

101 The first Jatinga immigrants occupied one ridge of the mountain where the present Jatinga is situated. Formerly, this land belonged to the Zemi-Naga,
245 one of the old inhabitants of the Cachar Hills, who possessed a vast jungle area for jhum cultivation. It seems that there was no objection to the Khasi occupying this small spot: it was apparently too small an area for the jhum cultivator —pan-leaf cultivation of the Khasi requires less than one twentieth of the land of the usual jhum cultivation. The Khasi who started pan-leaf cultivation were able to accumulate some capital, and after several years they started orange gardens. They had had experience of orange cultivation in their homeland, but this was the first time they had operated commercially.

245 The success of this orange cultivation was beyond their dreams. Hearing
434 of good oranges at Jatinga, many Bengalee merchants from Dacca, Sylhet,
439 Silchar and Gauhati began to come to buy them. Moreover, the village had the great advantage of being situated near the railway station. Oranges were sold by carloads. Unimaginable wealth came to the Jatinga people. Especi-
[496] ally the founder's family, including his brother's and sister's, became extraor-
[871] dinarily wealthy; their income used to be Rs. 20,000 a year. The children were sent to the school which was established in the village and some were educated at colleges in Dacca, Sylhet and Shillong. The villagers had
[362] beautiful houses built by Manipuri and Bengalee carpenters. Actually the houses of Jatinga were known as some of the best construction in Assam.

Like the Shella people, they were managers of gardens and employed workers.
245 Wealthy households used to engage several labourers annually, most of them
46 from Jaintia where the Jatinga people had originated. These workers were provided with shelter in the servant quarters of their employer's house, but they had to provide meals for themselves. They were paid daily according to the work done. They were available to other households, when their employer had no work. Some labourers were also engaged locally among the Zemi-Naga, the Cacharee and the Kuki, though not as many as among the Jaintia.
245 These local tribes were fairly well occupied by their jhum cultivation, and not
464 used to being employed as workers. Therefore, most of them were not regular

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

workers and they were few in number.[1] They were particularly employed for such work as the clearing of jungle for new pan gardens in summer. 245 464

In the orange season (December to February) the number of workers increased and they were paid more: Rs. 1/8 were paid[2] for one load (one person carring 80 pounds of oranges, from an orange garden to the railway station—about two miles). Usually a worker made three to five trips a day. Many workers from Jaintia used to come for this particular season. 245 464 465

Semi-permanent workers were engaged for wet rice fields. They were usually Hindu cultivators: since these Khasi and other tribes do not know the technique of wet cultivation, plains people like the Biharee immigrants were engaged. These workers were provided with servants' quarters where they lived with their wives and children. However, very few Jatinga households possessed rice fields. 243 464

The economic prosperity of Jatinga reached its climax during the period from 1934 to 1940. Since 1942, the orange production has been decreasing. In 1945, a serious disease attacked the orange gardens as well as the pan-leaf gardens. Besides, by depriving Jatinga, as it had Shella, of their most important markets, Dacca and Sylhet, the Partition of India and Pakistan in 1947 caused a serious economic depression in the whole region. On the other hand, because of the past prosperity, the population has rapidly increased during the last ten years. The serious economic condition of Jatinga is illustrated in the petition which was submitted by the Jatinga people when the Governor of Assam visited those areas in January 1956. It runs thus: 245 434 731 161 458

"Since the last ten years or so, with the increase of population in the village and with the loss of fertility of the soil, the people were faced with economic depression. At present they are facing acute shortage of land they have also no scope to adopt other forms of cultivation like jhuming and wet rice cultivation, etc. Moreover, there has been successive attack of Bright's disease which destroyed and wiped out all the orange and pan gardens. And as such, majority of the families have to depend for their livelihood on daily wages. . . ."

It is indeed a serious situation for them, because the Khasi do not produce staple foods, such as rice; their economy is completely dependent on the trade of their products by which they purchase their main provisions, clothes, etc. Other peoples round Jatinga, being jhum cultivators, can at least get rice and cotton: the minimum requirements, staple foods and clothing are available even in the worst conditions, so that they can at least maintain themselves though the standard of living is low. As I stated before, a few households in Jatinga possessed rice fields, but the majority had none. Recently they rented some plots of jhum field for rice cultivation from Zemi-Naga of neighbouring villages.[3] However, its yield was but a small percentage of their consumption. A few 182 434 [433] [243]

1. If they had worked in the gardens of Jatinga, they might have got more profit than from their own jhum fields. For one day's labour, they got Ans. 8/. For one month, they could earn Rs. 15 with which they could buy about 4-5 maunds of rice (one maunds paddy cost Rs. 3-4). For one year it became 50 maunds, which was impossible to produce in a jhum field by a single person's labour. [435]

2. These rates, including the figures of note 1, apply to 1956.

3. Jatinga villagers told me that Zemi-Naga were kind enough to lend them their field for a negligible rent, though they had not enough for themselves. Zemi-Naga said that they owed much to Jatinga in the past, so that now they sympathised with the condition of Jatinga, and offered some parts of their jhum field. [427] [628]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

182 very wealthy households still maintain their former economic activities, but
434 the majority have been impoverished, becoming daily labourers for the wealthy ones or for road construction. Thus considerable internal economic differentiation has begun to appear in the community.

Though the recent economic depression brought poverty to Jatinga, the
182 standard of living is still strikingly higher than that of neighbouring tribes. Studying such economic aspects of Jatinga, I wondered at first why these
• 245 neighbouring tribes have remained as they were, except for temporary employ-
648 ment at Jatinga: why, looking at the prosperity of Jatinga, they did not adopt the way of the Jatinga people?

Indeed some of them attempted to imitate the Jatinga economy, but the results were unfortunately not favourable to them. First, both pan-leaf and orange cultivations were entirely new to the tribal peoples, and the technique was quite different from that of dry rice cultivation in the jhum field. Pan cultivation requires very delicate care which is almost impossible to manage for people who have been accustomed to the primitive jhuming cultivation. For instance, when they go into pan gardens, they have to wash themselves and put on special clean clothes in order to prevent the spread of epidemic leaf disease. Tribal people, who seldom wash their clothes, or mostly go naked, could hardly keep pan gardens. In this respect the Khasi are entirely different, having specialized in this economy for a long period, even as they believe, from time immemorial.

On the other hand, the technique of orange cultivation is much easier than that of pan-leaf, but it takes several years to obtain a yield; it requires considerable capital to begin with. For the jhum cultivators, who usually did not have cash income nor funds, it was almost impossible to start it, while the Khasi were able to raise funds from the selling of the pan-leaf. Furthermore, the
[423] management of such gardens, either pan-leaf or orange, differs also from that of the jhum field as it entirely depends on individual enterprise based on private land ownership, which is new for those tribes where the community owns the land. Therefore the possibility of starting orange gardens is restricted to special individuals among them belonging to exceptionally rich and powerful households. A few households in neighbouring villages did, in fact, start orange gardens, adopting the technique of the Jatinga people. This was around 1942 and they were expecting to have the yield around 1950. However, unfortunately, when their oranges began to come into production, orange disease started in Jatinga and spread all over these areas. Their dream therefore never came true.

Besides oranges, some of them also established gardens of bananas, jackfruits, and papaias, which were more successful than the oranges. These plantations started much earlier than oranges in this area, though not in great quantity. The products were sold to the Jatinga people who sold them again to Bengalee merchants. The question arises why were they not sold directly to Bengalee merchants, when the profit would have heen much greater.

This aspect of the market economy touches upon very interesting problems
182 concerning the relations between tribal and Hindu peoples. Such tribal peoples who live on a primitive subsistence level usually do not have direct contact
44 with the peoples of the plains. There is always an intermediary between them.
648 In this case it is the Jatinga people who know both tribal life and Hindu life. They are also in between culturally. If a tribal cultivator sells his produce to a Hindu merchant, he would most certainly be cheated by the cunning merchant, as he is quite ignorant of trade. Tribal men do deal with markets directly, but only on a small scale at Haflong bazaar, and without making a profit: it is just the exchange of their basketful of jhum produce for an iron

Uptill now the main sources of forest revenue in the district are timber, limestone, lac, bay leaf and elephants. 13

2.6 **Agriculture.**—The greater proportion of population of the distict subsist on agriculture. The staple crops raised in the district are wet and dry rice, various kinds of millets, maize, potatoes, pineapples, oranges, arecanut, betel-leaf and bay leaf. To a smaller extent they grow in the gardens round their houses vegetables, pulses and occasionally sugarcane. 24

2.6.1 **The main crops : Rice.**—While wet rice is grown in the valleys with which the hills are intersected, dry rice is grown on the hill sides. Highland rice is seldom grown twice running on the same spot for after one crop the soil is exhausted and a fallow period of four to five years is usually allowed. Jowai subdivision is predominantly a wet rice producing area. In Shillong subdivision main wet rice pockets are the Bhoi area stretching upto the sung valley and the northern portion of the plateau, the Mylliem state, the south-western portion of the district and the southern plain portion of the district adjoining East Pakistan. Dry rice is grown more or less through out the district. While Jowai subdivision can claim self sufficiency in rice, Shillong subdivision is a deficit area and the people in this subdivision particularly those in the southern portion (border area) of the district have to depend on supplies from outside. Though there is no reliable statistices of the area under rice, a rough estimate is given elsewhere in the land utilisation table. 243

Maize and millet.—are two important food crops of the district grown more or less throughout the district.

Potatoes are extensively grown in the higher slopes and in the lower land which are well drained. Generally two crops of potatoes are raised annually in the district. In respect of production and export of potato this district occupies the topmost position in the State of Assam. 244

Orange, betel leaf and arecanut are most extensively grown in the southern base of the hills, *i.e.* all over the border areas. Oranges are also grown in Bornihat areas, in the northern portion of the district. Orange and betelnut plantations extend from the foot of the hills to a height of about 1500 feet and are carried up the ravines which score the southern face of the high plateau. The district is an important producer of Bay-leaf which is abundantly found in the border areas of the district. Other valuable cash crops of the district are black pepper, turmeric, chillies, ginger, pineapple and various other fruits. 245

2.6.2 **Agricultural seasons.**—For wet rice, the lands which are naturally irrigated by virtue of their very location, are ploughed or hoed by about the middle of February and seed sown in May or June. Harvesting takes place in October and November. For dry rice, the land is hoed by about the middle of September, the solds are collected into little heaps and burnt and by February the land is again hoed up and the seed sown in April - May. Harvesting goes 243

243 on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in 244 April-May and ripens in August - September. For potato, generally three crops are raised in the district ; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

245 For oranges and betelnut the orchards are cleared of weeds twice a year. Harvesting of orange takes place from October to January. Betelnut ripens at the beginning of the year and are collected between February and May.

241 2.6.3 **Agricultural implements.**—The usual agricultural implements are a hoe, a sickle, three or four kinds of doas, a harrow, a crowbar which is used for the construction of irrigation channels, 'sierras' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and resembles the one in use in the plains of the State.

2. 6. 4. **General cultural practices.**—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

433 326 [323] 285 [306] 286 [171] [654] [231] 2.7 **Cottage Industries.**—Cottage Industries, it appears, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, pottery, baskets, mats and jewellery. In striking contrast with other districts weaving of cotton clothes is rare among the Khasis. The Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir Hills practice it only for their domestic consumption. At present, the Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

142 147 441 563 2.8 **The People.**—The Khasis and Jaintias are a short sturdy race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free from any inhibition. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.38 percent and 3·27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

241 [433] [461] 2.9 **Occupation.**—The greater portion of the population of the district subsists on cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

CHAPTER III

The Border Area

121 131 **3. 1 Definition of Border Area.**—The term 'border areas' although very frequently used does not refer to any well demarcated area. It was, therefore, decided after a joint discussion between the Director of Statistics with the Deputy Commissioner of the district and Subdivisional Officer, Jowai, that area within 20 miles of the Indo-Pak border line would be considered as the 'border area' for the purpose of the present survey. The list of the villages falling in this area was supplied by the Deputy Commissioner and the Subdivisional Officer.

3. 2 Condition of the Border Area before partition.—The border area under review thus comprised of the southern slopes of the Khasi and Jaintia Hills and a narrow strip of plains adjoining the southern slopes running along the Pakistan border. The area extends laterally over a length of about 120 miles, roughly from Maheskhola on the west to Sonapur on the east thus covering an area of 2,400 sq. miles approximately, comprising of 454 villages inhabited by population of 74 thousands. [161]

245 311 Barring the barren and rocky top plateaus the slopes are utilised or the production of valuable cash crops on intensive scale. These slopes provide suitable soil and climate for the production crops like arecanut, tezpatta, betel-leaf, oranges; pineapples and other fruits. On account of rich yields which such plantations give to the cultivators these slopes were, more densely inhabited and intensively cultivated than would appear possible from the topography of the area. Even the most inaccessible tracts in the slopes has been converted into rich orchards, wherefrom the produce was carried by headloads over steep gradients for several miles. Due to steep gradients little other use, except some jhuming here and there, could be made of this area. [482]

439 Because of the very topography, this land had its natural connections with Sylhet district now forming part of East Pakistan. From time immemorial the area had a flourishing trade with Sylhet district. It was a two-way traffic. The cash crops found eager buyers in the people of Sylhet, from whom in turn the people in the border area obtained supplies of rice, fish, vegetables and other necessities of daily life. Thus in prepartition days they enjoyed a very prosperous and settled economy. The rich buildings in the border area villages which are now lottering away, bear eloquent testimony to the past prosperity of the border economy.

439 458 648 With the partition of the country in 1947, trade with the plains of Sylhet, now forming part of East Pakistan, was restricted. As a result the whole economy of this region was completely shattered and the countryside which once hummed with activity and abundance was over-shadowed with unemployment, poverty and despair. All the cash crops-the mainstay of the border people lost the market in East Pakistan. for want of communication facilities the produce could not be

439 East Pakistan to which the people in the border areas were entitled
648 in the strength of various trade agreements of the Government of
458 India with the authorities in Pakistan, were also scanty. The situation was still more aggravated due to the stringent measures adopted by authorities in Pakistan, on the plea of prevention of smuggling, in December, 1957 when the entire border trade virtually came to a standstill.

245 This chaos in border economy has resulted in widespread unem-
439 ployment among the border people. There being no market for the
458 produce, the owners ceased to take proper care of their orchards and plantations. As a result thousands of labourers who were employed in the
464 orchards were thrown out of employment. Similar was the condition of those who were employed in the transportation of various commoditi s such as merchandise of trade etc. A large section of the people engaged in collection of limestone were also rendered unemployed with the set back received by the trade in limestone with East Pakistan. Due to stoppage of trans-border trade, petty traders engaged in distributive trade, also suffered.

423 Many of the border people possessing paddy lands and orchards in
648 areas that are located in Pakistan had to abandon them. The following
458 table will show the amount of land lying in Pakistan belonging to the farmer in the selected villages of border area :—

TABLE A-2

Name of villages	Area of land lost through partition		
	No. of familes who possessed land in Pakistan	Area (acres)	Average per family (acres)
1. Nongjri	87	357·86	4·11
2. Shella	9	175·40	19·40
3. Bholaganj	15	108·00	7·20
4. Balat	2	13·50	6·75
5. Mawdon . .	nil	..	..
6. Lyngkhat	5	85·00	17·00
7, Darrang	16	568·75	35·55
8, Syndai	3	43·33	14·44
9, Amki	8	40·67	5·08
10. Umshnong	nil	..	..

[167] A few families who did not have any landed interest on this side
[65] of the border were reported to have migrated to Pakistan. Most of the families are even now paying tax to East Pakistan authorities even though they are not getting any returns because they do not want to lose their right on land.

241 311 433 **8·4—Relative importance of crops**—Total gross farm area harvested amounted to 3324.48 acres in Border area, 1700.40 acres in Project area and 561 acres in General area.

From above table it will be seen that in Border area, orange accounted for the highest proportion of harvested area, *i.e.*, 31 per cent, followed in order of importance by betel nut, paddy, betel leaf and millet which respectively accounts for 17 per cent, 19 per cent, 9 per cent and 3 per cent of the total harvested area. Other crops which account for 248.68 acres (7 per cent) includes maize, tezpata, banana, turmeric, dal, blackpepper and other fruit crops.

Considering sale proceeds, it is clear that betelnut happens to be the main earner accounting for 60 per cent of the total sale proceeds followed by orange, paddy and betel leaf which respectively account for 22 per cent, 6 per cent and 5 per cent of the total sale proceeds. Thus orange and betel leaf which in pre-partition days were the main earner-crops in the Border area have been passed to second and forth position respectively—the proportions fetched by them, particularly by betel leaf, being negligible. On other hand as there is a good market for betel nut, Border people have taken to betel nut cultivation in a more extensive scale.

241 245 311 433 It is significant that while in Border area total farm area is 3914 acres, total area harvested comes to only 3325 acres including area under mixed cropping which is in wide practice in Border area particularly for orange, betelnut, and for some other minor crops. Thus proportion of unharvested farm area emerges out to be considerable which can be accounted for the following reasons:—

(1) The farm area includes some new gardens particularly of betelnuts which usually take quite a few years to bear fruits.

[44] (2) Reportedly a large number of orange and betel-leaf gardens were not harvested at all as there was no market for them.

241 433 44 Turning our attention to Project area and General area, it will be found that paddy eclipses all other crops in as much as in the two areas it respectively covers 82 per cent and 61 per cent of the total harvested area in the respective area. In Project area paddy is followed by Betel leaf, orange, potato and betelnut in order of importance while in General area it is followed by potato, millet, orange, betel leaf and betelnut. In both the areas as will be seen from table above, almost all the crops retain their respective position in value. Considering sale proceed, in Project area, paddy occupies the highest position accounting for 77 per cent of the total sale proceeds followed by betel leaf, orange, betelnut and potato accounting respectively for 8 per cent, 5 per cent, 5 per cent and 1 per cent of the total sale proceeds. In General area, in order of importance of sale proceed paddy, potato and betelnut are worth mentioning fetching respectively 45 per cent, 30 per cent and 4 per cent of the total sale proceeds.

8·5—In the following paragraphs we have reproduced the yield rates of different crops, calculated on the basis of area harvested and total produces reported by the cultivators. For assesment of correct yield rates it is necessary to conduct a scientifically designed crops cutting survey which in view of its largeness in magnitude and other complexities associated with the type of experiments, could not be fitted in with the programme of the present survey. It is admitted that the yield estimates worked out by us are proved to be subjected to the usual limitations of this type of data. 128 433

Yield

1. **Paddy.**—It will be seen from table above that average yields of paddy per acre for Border area, General area and Project area are respectively 8.38 maunds, 12.92 maunds and 12.60 maunds and for the district as a whole it comes to 11.65 maunds though there are cases where maximum yield goes to above 18 maunds per acre. Thus it is seen that the average yield is much less than the average yield for the State of Assam (plain district) which is above 18 maunds per acre. Average yield in Border area is evidently much smaller. Apart from low fertility of land, another reason for this low average is that in a number of villages selected from Border area such as Syndai, Amki and Lumshnong, there was widespread havoc to standing crops was caused by wild elephants. 243 433 [136]

2. **Potato.**—The average for the three areas comes to 21·61 maunds per acre which is in contrast to the State average of above 40 maunds per acre. Our estimate has in fact been lowered due to inclusion of a few villages in the foot hills where potatoes don't grow well, otherwise in a number of high altitude villages, yield per acre well exceeded 40 maunds. The average for Border area is rather too low. Apart from unsuitability of Border land of high altitude potatoes another reason for this low average is that during the reference year the crop suffered from widespread incidence of pests and insects. 244 433 [136]

3. **Orange.**—yield of orange in Border area, Project area and General area was found to be 5. 27 luties or 5396 numbers against 16.76 luties or 17162 numbers and 2.80 luties or 2867 numbers respectively Thus the average yield in Border area, even considering the mixed nature of some gardens is much low. The reasons are obvious. 245 433

4. **Betelnut**—Average yield per acre from Border area, Project area and General area was found to be 2.93 luties (18752 numbers), 4.11 luties (26304 numbers) ann 3.03 luties (19392 numbers) respectively bringing the average for all the three areas to 2.95 luties per arce. 249 433

5. **Betel leaf.**—Average yield per acre works out at 17·15 kuris, 50.64 kuris and 24 kuris in Border area, Project area and General area respectively. Thus in Booder area the average is much lower. This is due to the fact that most of the gardens remained unplucked for want of market for leaf.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

There is considerable trade carried on in
245 *tezpát* or bay leaves, the trees being extensively cultivated by the
439 inhabitants of the lower slopes of the hills on the Sylhet border. The finest oranges in India are also grown in groves in the same tract, the value of the trade in which is now (1876) estimated to amount
237 to £3760 per annum. Lac is gathered by the Míkírs in the Jáintiá
439 Hills, but not to any great extent. Bees are both domesticated and found wild, and an extensive trade in bees-wax is carried on,
231 the amount exported being estimated at from three hundred to four hundred *maunds* annually. The whole of the Hills, where there is
233 no forest, and where the land is not under cultivation, consists of
621 rich pasture grounds, which are held in common by the villagers
651 and pay no revenue to Government.

137 The forests of the Khásí and Jáintiá Hills do not yield much profit either to the British Government or to the chiefs. There
[648] are no reserved forests in the District; and according to the Deputy-Conservator, the total area of unreserved forest, *i.e.* of land covered
[659] with timber trees and not at present required for *júm* cultivation, is only 150 square miles. The trees found are chiefly pine, and those classified as 'mixed upper hill forests.' At an elevation of 3000 feet, the Pinus Kasia predominates over all other vegetation and forms almost pure pine forests. It is found also at lower heights, and there attains larger dimensions, but only in the case of isolated trees. The 'mixed upper hill forests' are confined to a series of sacred groves, which clothe the topmost ridge of the watershed between the valleys of the Brahmaputra and Surmá. The characteristic trees are those of a temperate vegetation, chiefly consisting of oaks, chestnuts, magnolia, Schima, Cinnamomum, Prunus, Engelhardtia, etc. There are also numerous other timber trees, including the valuable *sál* (Shorea robusta) and the rubber tree (Ficus elastica); but on the whole the Khásí Hills are remarkable for the
[648] absence of forest. Early in 1874-75 measures were taken to put a stop to the indiscriminate burning of the forests, and the Siems and
[659] village officers were made responsible for the conservancy of the sacred groves. These endeavours have met with some success; but it is a very difficult thing to change the habits of a population, or to induce uncivilised tribes to incur a small temporary inconvenience for the sake of future benefit. The total area directly protected from fire during the year 1875-76 is returned at 3618 acres; the expenditure was Rs. 122; and in ten prosecutions for breaches of forest rules, twenty-three persons were convicted.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

243 the District, nor do any superior kinds of cereals appear to have been substituted for inferior ones.

THE DIFFERENT STAGES OF RICE CULTIVATION, in English and Khásí, are as follow:—The blade as it first shows, *spch-u-kyba;* the blade when well above the ground, *la-thylleng-u-kyba;* the ears when first formed, *lam-mat;* the ears beginning to ripen, *byr-tem;* the ripe ears, *la-hih;* unhusked rice, *u-kyba;* husked rice, *u-khaw;* cooked rice, *ka-ja.*

262 [435] [782] THE VARIOUS SOLID AND LIQUID PREPARATIONS made from rice are the following:—(1) *U-kypu*, cakes of different kinds, sold at six or twelve for a penny, according to size. (2) *U-shirí* or *gáh-khir*, prepared by the hillmen as an offering to their deity at the conclusion of the harvest. (3) *Kadam*, fermented rice water, sold at the rate of from three-farthings to threepence per quart, according to the strength of the liquor. (4) *Ka kiad-phatika* or *ka kiad-hárak*, a kind of spirits distilled from rice, and sold at from threepence to fourpence-halfpenny per quart.

273 435

243 OTHER CEREALS.—Indian corn, or *u-riu-ha-dem*, is grown on homestead lands. The ground is first manured, and the seed is sown about the middle of April. The crop is fit for cutting in September and October. A kind of millet seed called *u-krdi* is commonly sown with paddy on high lands. For want of more suitable land, however, this crop is often cultivated by itself on rocky slopes; and when this course is adopted, the jungle is first cut down in February and burnt. The seed is sown in April, and the crop gathered in December.

244 PULSES AND FIBRES.—Only two kinds of pulses are grown in the Hills, *u-rym-bai-ktung* and *u-rym-bai-jil*, both of which are varieties of beans. They are sown on high lands in March and April, and gathered in December. The only fibre is that made from the pine-apple stalk, which is largely used for making netted bags.

283

245 [439] MISCELLANEOUS CROPS.—(1) Oranges.—There are numerous orange plantations in the neighbourhood of Cherrá Púnjí, and the fruit is exported to all parts of Bengal. In the year 1876-77 the estimated exports were 9,400,000 in number, valued at Rs. 37,600, or £3760, at the rate of Rs. 12 or £1, 4s. per three thousand. These figures show a decrease in number as compared with the estimated export twenty years ago. The trees flower in March or April, and the fruit ripens in October and the following months. In some cases the oranges are allowed to remain on the trees till March, but

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

generally the gathering does not extend beyond January. As a rule, the cultivation is confined to the valleys and slopes on the southern face of the hills. (2) Pine-apples are also largely cultivated on the southern slopes, and grow to great perfection on the limestone formation. The fruit ripens in May or June, and is exported in considerable quantities. In 1876-77 the export of pine-apples was valued at Rs. 8000 or £800. (3) Potatoes are extensively grown on slopes of high land, and also in the low-lying fields where the land is well drained. The tuber was first introduced into the Hills in 1830 by Mr. Scott, who was then the Governor-General's Agent. The season for sowing commences about the middle of February when the rains set in early, and in April when they are late. The ground is dug up and carefully manured with burnt earth, and holes are dug about nine inches deep, and the same distance from each other. These holes are then partially filled in with loose earth, and a potato or two halves of one placed in each. They are then filled up with dry manure and soil. When the plant is fifteen or twenty days old, the ground about the roots is loosened and the plant earthed up, and the land is kept carefully weeded. In about four months after sowing, the crop is gathered. During the cold weather a second crop is raised, the seeds being planted in September and the tubers dug up in December. Potato cultivation has largely increased of late years in the District. In 1876-77 the exports were approximately estimated at 200,500 *maunds*, or 7480 tons, valued at Rs. 501,250 or £50,125, at the rate of Rs. 2. 8 per *maund*, or £7 per ton. (4) Sugar-cane is grown, but not to any great extent; cuttings are planted in March, and the cane ripens by November or December. (5) *Pán* is extensively cultivated, the runner being trained up trees standing in deep and shady valleys. Planting is carried on during the months of April and May, but the leaves are not fit to be gathered till the plant is two years old. (6) The *supári* or betel-nut (Areca catechu), called *u-kwai* by the Khásiás, is grown on the lower southern slopes of the hills, and, together with the *pán* leaf, is consumed in immoderate quantities by the inhabitants, who measure distance by the number of *páns* consumed on a journey. It is also exported to the plains. (7) *U-soh-phlang*, a root crop resembling a small turnip, is sown on high lands in April and gathered in September. It is a poor vegetable, but the natives of the Hills are fond of it, and eat it either raw or cooked. (8) Cotton is grown on high lands and

245 244 [439] [177] [439] 249 244 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

extent of waste land, some is cultivated in a manner resembling the *jum* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *jumid* tenure. Any renting of land is exceptional, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

MANURE is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 2s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 243 244 [435]

IRRIGATION for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

MODEL FARM.—The Shillong Model Farm, established in 1873, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red roughs' and 'pheasant's eye'—were successfully introduced in 1873-74; but these are not looked upon favourably by the Khásiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unfitness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1744 177 244 648 654 177 245 648 654 [134] [136] 231 648 654

Text continued from page 138.]

This price is about the same as it was twenty years ago, but the quantity has increased fourfold. The potato was first introduced into the Hills in 1830 by Mr. David Scott, who was then the Governor-General's Agent. 'No greater boon could have been conferred upon the people.' The local trade is entirely in the hands of the Khásás themselves, and the larger portion of the produce is despatched direct to Calcutta. According to the registration returns of river traffic in Bengal, the export of provisions (including vegetables) from Sylhet in 1876-77 was 123,108 *maunds*, valued at Rs. 369,324, or £36,932, at the rate of Rs. 3 per *maund*.

[177]
[244]

The export of oranges in 1876-77 was 9,400,000 in number, valued at Rs. 37,600, at the rate of Rs. 12 per 1000. These figures apparently show a great decrease since 1858. At that time Mr. Inglis possessed the entire monopoly of the trade, by means of the leases which he held from the Khásí Chiefs of all the valuable groves. The annual produce of his groves was estimated at forty-five millions of oranges, having increased from eleven millions within the

439
434
245
648

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

439 previous twenty years. The oranges, like the lime, were brought
648 down to Mr. Inglis' depot at Chhaták, where they were sold to
245 the dealers at the rate of about Rs. 1. 12 per 1000, or less than
434 half their present estimated price. It is stated in Mr. Allen's Report, that the Calcutta market was then chiefly supplied from the groves of Shella Púnjí and Bor Púnjí; the produce of the other villages was more perishable, and required to be sold in the neighbouring Districts. The fruit is known in Calcutta as 'Sylhet oranges.' The Bengal registration returns for 1876-77 show a total export from Sylhet of 64,505 *maunds* of 'fruit,' valued at Rs. 193,515, or £19,251.

439 The export of raw cotton appears to have greatly increased. In 1876-77 the total quantity exported was 36,000 *maunds*, valued at Rs. 216,000, or £21,600, at the rate of Rs. 6 per *maund*. Twenty years before the export had been only 12,000 *maunds*, valued at Rs. 42,000, at the rate of only Rs. 3. 8 per *maund*. The cotton is of inferior quality, with a short and woolly staple. It is chiefly consumed by the Sylhet weavers. The total registered export from that District in 1876-77 was only 4300 *maunds*, valued at Rs. 64,500,
434 at the high rate of Rs. 15 per *maund*.

439 The chief article of import now, as twenty years ago, is rice; for
[178] the hill-men have never grown sufficient for their own consumption,
[243] and the recent establishment of the Civil Station of Shillong has increased the demand. In 1876-77 the total imports of rice were estimated at 205,800 *maunds*, valued at Rs. 720,300, or £72,030, at the rate of Rs. 3. 8 per *maund*. Twenty years ago the imports were nearly as great, viz. 150,000 *maunds*; but the value was only Rs. 225,000, at the rate of Rs. 1. 8 per *maund*, or less than one-half the present value. The chief source of supply is Sylhet District, which sends its surplus to the tea gardens of Cáchár, as well as to these Hills, and also exported, in the year 1876-77, 214,000 *maunds* of rice and 433,100 *maunds* of paddy into Bengal.

The importation of fish (fresh and dried) has enormously increased. In 1876-77 the total amount was 35,900 *maunds*, valued at Rs. 215,400, or £21,540, at the rate of Rs. 6 per *maund*. Twenty years ago the value was only Rs. 20,000, but the quantity is not given. The preparation of dried fish is a flourishing industry in the adjoining District of Sylhet.

The importation of cotton cloth has increased in an almost equal proportion. The value in 1876-77 was Rs. 158,000, or £15,800, as

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

(*ki thiar*). The paddy-fields are not manured. The Khasis 243
when cultivating high lands, select a clayey soil if they can. In the early part of the winter the sods are turned over with the hoe, and they are exposed to the action of the atmosphere for a period of about two months. When the sods are dry, they are placed in piles, which are generally in rows in the fields, and by means of ignited bunches of dry grass within the piles a slow fire is kept up, the piles of sods being gradually reduced to ashes. This is the "paring and burning process" used in England. The ashes so obtained are then carefully raked over the field. Sometimes other manure is also applied, but not when paddy is cultivated. The soil is now fit to receive the seed, either high-land paddy, millet, Job's tears, or other crops, as the case may be. The homestead lands are plentifully manured, and consequently, with attention, produce good crops. They are cultivated with the hoe.

The cultivation of oranges in the southern portion of the 244
district ranks equally in importance with that of the potato in 245
the northern. The orange, which is known in Calcutta as the Chhatak or Sylhet orange, comes from the warm southern slopes of the hills in this district, where it is cultivated on an extensive scale. Although oranges do best when there is considerable heat, they have been known to do well as high as 3,000 ft.; but the usual limit of elevation for the growth of oranges in this district is probably about 1,000 to 1,500 ft. The orange of the Khasi Hills has always been famous for its excellence, and Sir George Birdwood, in his introduction to the "First Letter Book of the East India Company," page 36, refers to the orange and lemon of Garhwal, Sikkim, and Khasia as having been carried by Arab traders into Syria, "whence the Crusaders helped to gradually propagate them throughout Southern Europe." Therefore, whereas the potato was imported, the orange would appear to be indigenous in these hills. 05

Nurseries.—The seeds are collected and dried by being 247
exposed to the sun. In the spring nurseries are prepared, the ground being thoroughly hoed and the soil pulverised as far as possible. The nursery is walled with stones. The seeds are then sown, a thin top layer of earth being applied. The

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

247 nurseries are regularly watered, and are covered up with layers of leaves to ensure, as far as possible, the retention of the necessary moisture. When the plants are 3 or 4 in. high, they are transplanted to another and larger nursery, the soil of which has been previously well prepared for the reception of the young plants.

245 An orangery is prepared in the following manner:—

The shrubs, weeds and small trees are cut down, leaving only the big trees for the purpose of shade. The plants from the nurseries are planted from 6 ft. to 9 ft. apart. When they have become young trees, many of the branches of the sheltering trees mentioned above are lopped off, so as to admit the necessary amount of sunlight to the young orange trees. As the orange trees increase in size, the sheltering trees are gradually felled. The orchard requires clearing of jungle once in spring and once in autumn. The Khasis do not manure their orange trees, nor do they dig about and expose the roots. The price of orange plants is from 75 to 100 plants per rupee for plants from 1 to 2 ft. in height, and from fifty to seventy-five plants per rupee for plants from 2 to 5 ft. in height. Orange trees bear fruit when from five to eight years old in ordinary soils. In very fertile soils they sometimes bear after four years. A full-grown tree yields annually as many as 1,000 oranges, but a larger number is not unknown. The larger portion of the produce is exported from the district to the plains, and to fruit markets at the foot of the hills such as Thoria, Mawdon, and Phali-Bazar, on the Shella river, whence it finds its way to the Calcutta and Eastern Bengal markets.

244 Potatoes are raised on all classes of land, except *hali*, or wet paddy land. When the land has been properly levelled and hoed, drains are dug about the field. A cultivator (generally a female), with a basket of seed potatoes on her back and with a small hoe in her right hand, digs holes and with the left hand drops two seed-potatoes into each hole. The holes are about 6 in. in diameter, 6 in. deep, and from 6 to 9 in. apart from one another. Another woman, with a load of manure in a basket on her back, throws a little manure over the seed in the hole, and then covers both up with earth.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

considering. Some of the leading characteristics of the Lynngams will now be detailed. The Lynngams are by complexion swarthy, with features of Mongolian type. The men are of middle height and the women remarkably short, both ~~sexes being~~ not nearly so robust as the Khasis, a result due probably to climatic influences, for the Lynngams live in fever-haunted jungles. The men have very little hair about the face, although a scanty moustache is sometimes seen, the hairs in the centre being carefully plucked out, the result being two tufts on either side. Beards are never seen. The women are ill-favoured, and wear very little clothing. The men wear the sleeveless coat of the Khasi and Mikir pattern, called *phong-marong*, which is made of cotton dyed red, blue, and white. This custom may have been borrowed from the Khasis. They do not grow their own cotton, but obtain it from the plains. They make their own dyes, *changlong* (red) and *hur sai-iong* (black). A cotton cloth, barely enough for purposes of decency, is tied between the legs, the ends being allowed to hang down in front and behind. Sometimes an apron is worn in front. At the present day the men wear knitted woollen caps, generally black or red, of the Nongstoin pattern (a sort of fisherman's cap), but the elderly men and head-men wear turbans. The females wear a cotton cloth about eighteen inches broad round the loins, sometimes striped red and blue, but more often only dark blue. A blue or red cloth is thrown loosely across the shoulders by unmarried girls, but married women only wear the waist-cloth, like the Garos. A cloth is tied round the head by married women, sometimes, Garo fashion. The women wear quantities of blue beads as necklaces, like their Garo sisters. They obtain the beads from the Garo markets at the foot of the hills. Brass ear-rings are worn by both sexes; the women, like the Garos, load their ears to such an extent with brass rings as to distend the lobes greatly. Silver armlets are worn by the head-men only, or by those who possess the means to give a great feast to the villagers. This is the custom of the Garo *nokmas*, or head-men. Both sexes wear bracelets. The men also wear necklaces of beads. The rich wear necklaces of cornelian and another stone which is thought by the Lynngams to be valuable. A necklace of such stones is called *u'piong blei* (god's necklace).

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

(9) Cotton is grown on high lands and
248 slopes; it is sown in April, and becomes fit for picking by January.

311 241 648 Area and Out-turn of Crops.—According to the Assam Administration Report for 1875-76, the area of the British portion of the Khásí and Jáintiá Hills District amounts to 2160 square miles, of which only 110 are under cultivation; of the remainder, 1337 square miles are set down as cultivable, and 713 as uncultivable. The total area of the semi-independent Khásí States is given as 3997 square miles, of which 176 are under cultivation, 2561 are cultivable, and 1260 uncultivable. In another portion of the same Report, the area under various crops throughout the entire District is thus approximately estimated:—Rice, 59,880 acres; other food grains, 57,820 acres; cotton, 1076 acres; potatoes, 33,880 acres. The average out-turn of rice per acre is returned at 8 *maunds*, or nearly 6 cwt.; of other food grains, 3 *maunds*, or over 2 cwt.; of cotton, 1 *maund*, or 1½ cwt.; of
[435] potatoes, 55 *maunds*, or nearly 40 cwt. The price of rice in 1875-76 was Rs. 4. 8 per *maund*, or 12s. 8d. a cwt., which gives Rs. 36 or £2. 12s. as the value of the rice crop obtained from one acre.

241 423 433 Condition of the Peasantry.—The Khásás can scarcely be considered an agricultural people, as they do not grow sufficient grain for their own subsistence, and are dependent to a great extent on imports of rice from the neighbouring Districts. Ten acres is generally considered a comfortable holding for a husbandman in the position of an ordinary Bengal peasant, but scarcely any man in the Hills depends entirely upon the produce of his land for
[231] his support. In the Jáintiá Hills a cultivator's position is con-
[554] sidered to be very low if he possesses no cattle, but performs all the operations of agriculture with his own hands. In that portion of the District, five acres is all that can be cultivated with a single
[465] pair of oxen, the average being four acres. A husbandman with a holding of five acres would not be so well off as a retail shopkeeper, nor would it enable him to live as comfortably as he could on a money wage of Rs. 8 or 16s. a month. The peasantry, however, as a class are not in debt. The land is owned chiefly by small proprietors, who occupy and cultivate their hereditary fields. The relations of landlord and tenant do not exist in the Hills, and no rent is payable to any one; consequently the principle of Act x. of 1859 (the Rent Law of Bengal) has no application.

231 435 The Animals used in agriculture are oxen; goats and pigs are

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

mould. The plant[1] is watered by means of small bamboo aqueducts which are constructed along the hill-sides, the water being conducted along them often considerable distances. As in the plains, the leaves of the *pán* creeper are collected throughout the year. 245 [312]

The bay leaf (*'la tyrpád*, or *tezpát*) is classified in the *Agricultural Bulletin* as *Cinnamomum tamala*, and there is a note in the column of remarks that "this tree, as well as one or two others of the same genus, yields two distinct products, *tezpát* (bay leaf) and cinnamon bark." The bay leaf is gathered for export from the extensive gardens in Maharam, Malaisohmat, Mawsynram, and other Khasi States. The plants are raised from seed, although there are no regular nurseries, the young seedlings being transplanted from the jungle, where they have germinated, to regular gardens. Bay leaf gardens are cleared of jungle and weeds periodically; otherwise no care is taken of them. The leaf-gathering season is from November to March. The leaves are allowed to dry for a day or two in the sun, and then packed in large baskets for export. The gathering of bay leaf begins when the trees are about four years old. [439]

The following are the other minor crops which are grown in the Khasi and Jaintia Hills:—

Pineapples, turmeric, ginger, pumpkins and gourds, the egg plant, chillies, sesamum, and a little sugar-cane. The arum* (*ka shirin*) is also extensively grown in the hills, and forms one of the principal articles of food amongst the poorer classes; it is generally raised in rotation with potatoes, or is planted along with Job's tears. The stem of the arum is sometimes used as a vegetable, also for feeding pigs. 249 [262] [231]

In the Jowai Sub-Division, notably at Nartiang, there are fairly good mangoes, which are more free from worms than those grown in the plains of Assam.

The Bhois and Lynngams cultivate lac. They plant *arhar dal*, *u landoo*, in their fields, and rear the lac insect on this plant. Last year the price of lac at Gauhati and Palasbari markets rose as high as Rs. 50 per maund of 82 lbs., it is said, but the price at the outlying markets of Singra and Boko was 231 435

* Colocasia esculenta, Beng. *Kachu*. 137

[1] [i.e., the pán .... Analyst]

8·5—In the following paragraphs we have reproduced the yield rates of different crops, calculated on the basis of area harvested and total produces reported by the cultivators. For assesment of correct yield rates it is necessary to conduct a scientifically designed crops cutting survey which in view of its largeness in magnitude and other complexities associated with the type of experiments, could not be fitted in with the programme of the present survey. It is admitted that the yield estimates worked out by us are proved to be subjected to the usual limitations of this type of data. 128 433

Yield

1. **Paddy.**—It will be seen from table above that average yields of paddy per acre for Border area, General area and Project area are respectively 8.38 maunds, 12.92 maunds and 12.60 maunds and for the district as a whole it comes to 11.65 maunds though there are cases where maximum yield goes to above 18 maunds per acre. Thus it is seen that the average yield is much less than the average yield for the State of Assam (plain district) which is above 18 maunds per acre. Average yield in Border area is evidently much smaller. Apart from low fertility of land, another reason for this low average is that in a number of villages selected from Border area such as Syndai, Amki and Lumshnong, there was widespread havoc to standing crops was caused by wild elephants. 243 433 [136]

2. **Potato.**—The average for the three areas comes to 21·61 maunds per acre which is in contrast to the State average of above 40 maunds per acre. Our estimate has in fact been lowered due to inclusion of a few villages in the foot hills where potatoes don't grow well, otherwise in a number of high altitude villages, yield per acre well exceeded 40 maunds. The average for Border area is rather too low. Apart from unsuitability of Border land of high altitude potatoes another reason for this low average is that during the reference year the crop suffered from widespread incidence of pests and insects. 244 433 [136]

3. **Orange.**—yield of orange in Border area, Project area and General area was found to be 5. 27 luties or 5396 numbers against 16.76 luties or 17162 numbers and 2.80 luties or 2867 numbers respectively Thus the average yield in Border area, even considering the mixed nature of some gardens is much low. The reasons are obvious. 245 433

4. **Betelnut**—Average yield per acre from Border area, Project area and General area was found to be 2.93 luties (18752 numbers), 4.11 luties (26304 numbers) ann 3.03 luties (19392 numbers) respectively bringing the average for all the three areas to 2.95 luties per arce. 249 433

5. **Betel leaf.**—Average yield per acre works out at 17·15 kuris, 50.64 kuris and 24 kuris in Border area, Project area and General area respectively. Thus in Booder area the average is much lower. This is due to the fact that most of the gardens remained unplucked for want of market for leaf.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

The forest administration of the British Government is confined to two plantations in the neighbourhood of Shillong, for which a rent is payable in perpetuity. One of these, on the farther side of the Umkra, was originally acquired in 1871-72 for the sake of experiments in arboriculture. The rent of Rs. 50, or £5, is paid by the Forest Department; the area had been at first estimated at 580 acres, but an actual survey undertaken in 1875-76 reduced this estimate to 262·59 acres. A considerable portion is covered with Pinus Kasia, which is carefully protected. Of the exotic trees tried on this plantation, only the three following can be said to have done well: Juglans regia, Eucalyptus rostrata, and Pinus maritima. All the rest either suffered from frost in the winter, or required far more nursing than can be afforded them in forest plantations. The young trees of the indigenous oak (Quercus serrata) were also attacked by rats, who bit off great numbers just above the ground. The Spanish chestnuts did not thrive, and were removed to the model farm for trial at a higher elevation. The second plantation, on the northern slopes of the range immediately behind the Station, consists of several patches of forest, which were acquired in connection with the scheme for providing Shillong with a permanent water supply. The total rent is Rs. 375, or £37, 10s., paid from Town Improvement Funds; and the aggregate area is estimated at 796 acres. All the fields within this area that had formerly been cultivated by the Khásiás—about 80 acres in all—were sown by the Forest Department with Pinus Kasia, Quercus Griffithii, Q. serrata, and Q. fenestrata, which have succeeded well; and about 8 acres were planted with different species of Eucalyptus. Up to the close of 1875-76 the sum expended on the first of these two plantations was Rs. 742. 9. 9, or £74, 5s. 3d., and on the second, Rs. 730. 9. 6, or £73, 1s. 2d.

137 648 65 311 177

A cinchona plantation was started in 1867 by the Superintendent of the Calcutta Botanical Gardens. It consists of twelve small patches of plants near Nongklao, and one near Jírang, situated at elevations varying from 3500 feet to 2000 feet. The species cultivated are Cinchona succirubra, C. officinalis, and C. micrantha. At first they were under the charge of two Khási gardeners, who each received Rs. 16 a month, or £19, 4s. a year, to weed them and keep fires out. In 1874-75 these plantations were taken charge of by the Forest Department, and specimens of the cinchona bark were submitted for analysis to the Government Quinologist

249 648 65

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

249 648 65

at Dárjiling who reported unfavourably on them. They have since been made over to the Siem of Nongklao, who is responsible for their being kept clear of weeds and protected against fire. Up to the close of 1875-76 the total expenditure had been Rs. 672, or £67, 4s. 6d.

136 [224] [648] [165]

FERÆ NATURÆ.—Tigers, elephants, rhinoceros, buffaloes, *mithuns* or wild cows, bears, leopards, wolves, jackals, foxes, wild hog, and several kinds of deer abound in the Khási and Jáintiá Hills. The expense of keeping down tigers in the shape of Government rewards amounted to £44, 10s. 0d. in 1869-70. The rate of reward now paid is Rs. 25 or £2, 10s. 0d. per head. No rewards have ever been given for the destruction of venomous serpents. The number of deaths from wild beasts and snake-bite reported to the police amounted to 28 in 1866-67, 18 in 1867-68, 16 in 1868-69, and 26 in 1869-70. The small game found in the Hills consists of black partridges, hill partridges, quails, ducks, teal, snipe, and woodcocks. The *mahsir* fish is caught in the rivers. No regular trade is carried on in the skins of wild animals; and, except in the case of wild elephants, the *feræ naturæ* are not made to contribute towards the wealth of the people.

226 439

224 648 651

ELEPHANTS.—Wild elephants are found in the lower ranges of the hills, and in the gorges opening on the valleys of the Surmá and the Brahmputra. Each State in the Khási Hills and each dollo-ship in the Jáintiá Hills constitutes a separate hunting circle or *mahál*. In the Khási States the conditions of elephant hunting are governed by rules framed in 1874-75 by the Chief Commissioner, and approved by the Government of India. These rules provide, (1) that the British Government will make no claim to royalty on account of elephants caught in the Khási Hills; (2) that one half of the proceeds of the sale of each elephant caught shall be paid over to the chief whose State forms the *mahál*, and the other half retained by Government; (3) that if a chief wishes to hunt elephants on his own account, the *mahál* composed of his State shall be reserved from sale, and a special arrangement shall be made with him on the basis that half the proceeds of the hunting shall accrue to Government. A special form of hunting licence in accordance with these rules has been settled by the Chief Commissioner. In the Jáintiá Hills, as being British territory, the ordinary Assam rules are in force, in accordance with which leases of the *maháls* are sold at intervals of two years to the highest bidder at

20: Hunter G-4 (no date) 1897 AR 7 Khasi AR 7

generally the gathering does not extend beyond January. As a rule, the cultivation is confined to the valleys and slopes on the southern face of the hills. (2) Pine-apples are also largely cultivated on the southern slopes, and grow to great perfection on the limestone formation. The fruit ripens in May or June, and is exported in considerable quantities. In 1876-77 the export of pine-apples was valued at Rs. 8000 or £800. (3) Potatoes are extensively grown on slopes of high land, and also in the low-lying fields where the land is well drained. The tuber was first introduced into the Hills in 1830 by Mr. Scott, who was then the Governor-General's Agent. The season for sowing commences about the middle of February when the rains set in early, and in April when they are late. The ground is dug up and carefully manured with burnt earth, and holes are dug about nine inches deep, and the same distance from each other. These holes are then partially filled in with loose earth, and a potato or two halves of one placed in each. They are then filled up with dry manure and soil. When the plant is fifteen or twenty days old, the ground about the roots is loosened and the plant earthed up, and the land is kept carefully weeded. In about four months after sowing, the crop is gathered. During the cold weather a second crop is raised, the seeds being planted in September and the tubers dug up in December. Potato cultivation has largely increased of late years in the District. In 1876-77 the exports were approximately estimated at 200,500 *maunds*, or 7480 tons, valued at Rs. 501,250 or £50,125, at the rate of Rs. 2. 8 per *maund*, or £7 per ton. (4) Sugar-cane is grown, but not to any great extent; cuttings are planted in March, and the cane ripens by November or December. (5) *Pân* is extensively cultivated, the runner being trained up trees standing in deep and shady valleys. Planting is carried on during the months of April and May, but the leaves are not fit to be gathered till the plant is two years old. (6) The *supâri* or betel-nut (Areca catechu), called *u-kwai* by the Khásiás, is grown on the lower southern slopes of the hills, and, together with the *pân* leaf, is consumed in immoderate quantities by the inhabitants, who measure distance by the number of *pâns* consumed on a journey. It is also exported to the plains. (7) *U-sah-phlang*, a root crop resembling a small turnip, is sown on high lands in April and gathered in September. It is a poor vegetable, but the natives of the Hills are fond of it, and eat it either raw or cooked. (8) Cotton is grown on high lands and

245 244 [439] [177] [439] 249 244 000

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas.

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups.

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men.

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

249 173 [115] my informants at Padu), in the year 1933, is said to have begun the cultivation of yam (*shniw*) and millets (*knei*) in the then uncultivated slopes. He and his people used to be, on this account, ridiculed as monkeys (*shrieh*). The Nonglamin clan took later to pan-leaf-, and arecanut-cultivation and became one of the richest landowners of the Wár-country. Others followed and imitated them. This clan (*kur*) is now residing at Nongtalang, about ten miles east of Padu in the Wár-Jaintia slopes.

174 184 601 This possibility of a comparatively recent origin of the now economically independent Wár-groups among the Khasi speaking peoples is of importance to the question of some different terms in kinship terminology which the following lists will show.

184 601 Comments on other features in the relationship terminology, bearing on sociological or historical problems of either among the four Khasi speaking groups under discussion, are being hinted at in the text of the lists itself and further discussed in Part Three of the present paper, following the lists of kinship terms.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

262 also eat field rats and one kind of monkey (*u shrih*). The Syntengs and Lynngams are fond of tadpoles, and the Khasis consider a curry made from a kind of green frog, called *ka japieh*, a *bonne bouche*. They, however, do not eat ordinary frogs (*jakoid*). The Khasis of Mariao, Maharam, Nongstoin and some other Siemships eat the hairy caterpillar, *u'ñiang phlang*.

262 A staple food which must not be forgotten is the inner por-
252 tion of the bark of the sago palm tree, *ka tlái*, which grows wild in the forest and attains a large size. The tree is felled and the outer bark removed, the soft inner part is cut into slices, dried in the sun, pounded in a mortar and then passed through a fine bamboo sieve. A reddish flour is obtained, of sweet taste, which is boiled with rice. This flour is said to make good cakes and puddings.

262 Although the Khasis are such varied feeders, there are some
614 clans amongst them which are prohibited by the ordinance of *sang*, or taboo, from eating certain articles. The following are some instances:—

The Cherra Siem family cannot eat dried fish (*'khá-piah*); the Siem of Mylliem must not eat the gourd (*u pathâw*); a fish called *ka'khá-lani* is taboo to some of the *Siem-lih* class. Some of the War people must not eat *ka ktung* (preserved fish), and the clan *'khar-um-núid* in Khyrim is debarred from the pleasure of partaking of pork. The flesh of the sow is *sang* to the *'dkhar* clan, although that of the male pig may be eaten.

DRINK.

273 The Khasis are in the habit of regularly drinking considerable quantities either of a spirit distilled from rice or millet (*ka'iad pudka*), or of rice-beer, which is of two kinds (1) *ka'iad hiar*, (2) *ka'iad um*. Both of these are made from rice and, in some places, from millet, and the root of a plant called *u khawiang*. *Ka'iad hiar* is made by boiling the rice or millet. It is then taken out and spread over a mat, and, when it cools, fragments of the yeast (*u khawiang*) are sprinkled over it. After this it is placed in a basket, which is put in a wooden bowl. The

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

quilt, made out of the bark of a tree, which is beaten 352
out and then carefully woven, several layers of flattened 513
bark being used before the right thickness is attained. 287
This quilt is called by the Lynngams "*Ka syllar*" (Garo *simpak*).
Food is cooked in earthen pots, but no plates are used, the broad 252
leaves of the *mariang* tree taking their place. The leaves are 415
thrown away after use, a fresh supply being required for each meal.

The Lynngams brew rice beer, they do not distil spirit; the 274
beer is brewed according to the Khasi method. Games they have 526
none, and there are no jovial archery meetings like those of the Khasis. The Lynngam methods of hunting are setting spring 221
guns and digging pitfalls for game. The people say that now the Government and the Siem of Nongstoin have prohibited both of these methods of destroying game, they no longer employ them. But I came across a pitfall for deer not long ago in the neighbourhood of a village in the Lynngam country. The people declared it to be a very old one; but this I very much doubt, and I fear that these objectionable methods of hunting are still used. The Lynngams fish to a 226
small extent with nets, but their idea of fishing, *par excellence*, is poisoning the streams, an account of which has already been given in this monograph. The Lynngams are omnivorous 262
feeders, they may be said to eat everything except dogs, snakes, the *hulok* monkey, and lizards. They like rice, when they can get it; for sometimes the out-turn of their fields does not last them more than a few months. They then have to fall back on Jobstears and millet. They eat arums largely, and for vegetables they cook wild plantains and the young shoots of bamboos and cane plants. The Lynngams are divided up into 614
exogamous clans in the same manner as the Khasis. The clans 773
are overgrown families. The Lynngams have some stories regarding the founders of these clans, of which the following is a specimen:—"A woman was asleep under a *sohbar* tree in the jungle, a flower from which fell on her, and she conceived and bore a female child who was the ancestress of the Nongsohbar clan." Some of the stories of the origins of other clans do not bear repeating. There do not appear to be any 582
hypergamous groups. As with the Khasis, it is a deadly sin to 614

527 clean. Others break off palm leaves and twigs from trees to decorate themselves and the place. A music ban takes care of the neces-
527 sary noise. The three pigs and goats are re-
• 252 ceived with shouts. Without much ceremony the animals are slain and now the actual festival begins: the cooking, the dancing and the eating.

The people divide into various groups. Some divide the slaughtered animals by the light of a great fire. The pieces of meat are put in one pile, the fat in another. About ten men sit around in a circle and begin to cut the meat into small cubes. These are then placed on little three-sided bamboo sticks. All the rest of the meat, such as lungs, heart, kidneys, and brains are put together in a cooking pot. [620] The girls and women sit at a third fire. They hold the fat and lard on long bamboo sticks over the fire to roast it on all sides by constant turning.
527 The rest of the men dance to the peculiar music. Each person dances alone. They hold long bamboo sticks in their right hands, and in their left hands they hold a bunch of branches from a tree or large leaves. Some make huge turbans for themselves out of rice straw. Decorated thus they hop from one foot to another, make deep bows now to the left, now to the right and alternately swing their bamboo sticks or their bunches of leaves. Others turn around in circles, beating time with their palm leaves. When the dancers are tired they take over the job of cutting the meat and cooking and the others decorate themselves for the dance. In reply to my question, what this all means, I received the following answer: "We are happy and for once we want to have a thoroughly good time. We

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

shield of Cherrápunji is used as a protection from rain. 293
Those of Maharam and Mawiang are each of a peculiar pattern. 352
Smaller shields are used as protections from the sun or merely for show, and there are specially small sizes for children. Then there are the different kinds of basket (*ki* 415
khok) which are carried on the back, slung across the forehead 482
by a cane head-strap. These, again, are of different sizes. They are, however, always of the same conical shape, being round and broad-mouthed at the top and gradually tapering to a point at the bottom. A bamboo cover is used to protect the contents of the basket from rain. There is a special kind of basket made of cane or bamboo with a cover, which is used for carrying articles on a journey. These baskets, again, are of different sizes, the largest and best that the writer has seen being manufactured at Rambrai, in the south-western portion of the hills. 412
Paddy is husked in a wooden mortar by means of a heavy 415
wooden pestle. These are to be seen all over the hills. The 256
work of husking paddy is performed by the women. A bamboo sieve is sometimes used for sifting the husked rice, a winnowing fan being applied to separate the husk. The cleaned rice is exposed to the sun in a bamboo tray. Paddy is stored in a separate store-house in large circular bamboo receptacles. These hold sometimes as much as 30 maunds* of grain. Large baskets are also used for keeping paddy in. In 415
every Khasi house is to be found the net bag which is made 825
out of pineapple fibre, or of a *stein*, the Assamese *riha* 436
(Boehmeria nivea). These bags are of two sizes, the larger one for keeping cowries in, the cowrie in former days having been used instead of current coin in these hills, the smaller for the ever necessary betel-nut. *Pán* leaves are kept in a bamboo tube, and tobacco leaves in a smaller one. Lime, for eating with betel-nut, is kept in a metal box, sometimes of silver, which is made in two separate parts held together by a chain. The box is called *ka shanam*, and 415
is used all over the hills. This box is also used for 981
divination purposes, one end of it being held in the hand, and the other, by means of the chain, being allowed to swing

* The maund is 82 lbs. 304

H. Gordon E-4, 5 (no date) 1907 ARY Khasi ARY

mould. The plant[2/1] is watered by means of small bamboo aqueducts which are constructed along the hill-sides, the water being conducted along them often considerable distances. As in the plains, the leaves of the *pân* creeper are collected throughout the year.

The bay leaf (*la tyrpâd*, or *tezpât*) is classified in the *Agricultural Bulletin* as *Cinnamomum tamala*, and there is a note in the column of remarks that "this tree, as well as one or two others of the same genus, yields two distinct products, *tezpât* (bay leaf) and cinnamon bark." The bay leaf is gathered for export from the extensive gardens in Maharam, Malaichmat, Mawsynram, and other Khasi States. The plants are raised from seed, although there are no regular nurseries, the young seedlings being transplanted from the jungle, where they have germinated, to regular gardens. Bay leaf gardens are cleared of jungle and weeds periodically; otherwise no care is taken of them. The leaf-gathering season is from November to March. The leaves are allowed to dry for a day or two in the sun, and then packed in large baskets for export. The gathering of bay leaf begins when the trees are about four years old.

The following are the other minor crops which are grown in the Khasi and Jaintia Hills:—

Pineapples, turmeric, ginger, pumpkins and gourds, the egg plant, chillies, sesamum, and a little sugar-cane. The arum* (*la shirin*) is also extensively grown in the hills, and forms one of the principal articles of food amongst the poorer classes; it is generally raised in rotation with potatoes, or is planted along with Job's tears. The stem of the arum is sometimes used as a vegetable, also for feeding pigs.

In the Jowai Sub-Division, notably at Nartiang, there are fairly good mangoes, which are more free from worms than those grown in the plains of Assam.

The Bhois and Lynngams cultivate lac. They plant *arhar dal*, *u landoo*, in their fields, and rear the lac insect on this plant. Last year the price of lac at Gauhati and Palasbari markets rose as high as Rs. 50 per maund of 82 lbs., it is said, but the price at the outlying markets of Singra and Boko was

* Colocasia esculenta, Beng. Kuchu.

I: Gordon E-4, 5 (no date) 1907 AR? Khasi AR?

cartridge all the fish within a certain area are killed, some escape. When poisons are used, however, some fish are not affected by them, and others are only stupefied for the time being and afterwards recover.

FOOD.

The Khasi and Syntengs ordinarily take two meals a day, one in the early morning and the other in the evening, but labourers and others who have to work hard in the open take a midday meal as well, consisting of cold boiled rice wrapped in a leaf (*ka já-ang*), cakes (*ki kpu*) and a tuberous root (*u sohphlang*) which is eaten raw. They are fond of all kinds of meat, especially pork and beef, although some of the Syntengs, owing to Hindu influence, abstain from eating the latter. Unlike the neighbouring Naga, Garo and Kuki tribes, the Khasis abstain from the flesh of the dog. Both Sivas and Shadwell say the reason why the Khasis do not eat the flesh of the dog is because he is in a certain sense a sacred animal amongst them. There is a Khasi folk-tale relating how the dog came to be regarded as the friend of man. It is, however, quite possible that the Khasis may never have eaten the flesh of the dog from remote times, and it is nothing extraordinary that the Khasis should differ in a detail of diet from the neighbouring Tibeto-Burman tribes which are so dissimilar to them in many respects. The Khasis, except some of the Christian community and some of the people of the Mawkhar, do not use milk, butter, or ghee as articles of food. In this respect they do not differ from the Kachari and Rabha of the plains or the Garos of the hills. The Manipuris now in its millions as a rule, does not use milk [illegible] tribes are exceptions. Before fowls or animals are killed for food, prayers must be said, and rice sprinkled on the body of the animal. The staple food of the Khasis is rice and dried fish. When rice cannot be obtained or is scarce, millet or *Job's tears* are used instead. The latter are boiled, and a sort of porridge is obtained, which is eaten either hot or cold according to fancy. Khasis eat the flesh of nearly all wild animals, they

1:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

262. also eat field rats and one kind of monkey (*u shrik*). The Syntengs and Lyngngams are fond of tadpoles, and the Khasis consider a curry made from a kind of green frog, called *ka jaynik*, a *lemon ki ioka*. They, however, do not eat ordinary frogs (*jakoid*). The Khasis of Marngo, Mahsawan, Nongstoin and some other Siemships eat the hairy caterpillar, *u'kiang phlang*.

262. A staple food which must not be forgotten is the inner portion of the bark of the sago palm tree, *ka tiai*, which grows wild in the forest and attains a large size. The tree is felled and the outer bark removed, the soft inner part is cut into slices, dried in the sun, pounded in a mortar and then passed through a fine bamboo sieve. A reddish flour is obtained, of sweet taste, which is boiled with rice. This flour is said to make good cakes and puddings.

262. Although the Khasis are such varied feeders, there are some clans amongst them which are prohibited by the ordinances of *ming*, or taboo, from eating certain articles. The following are some instances :—

The Chawra Sions family cannot eat dried fish (*kha pinik*); the Siems of Mylliem must not eat the gourd (*u pathaw*); a fish called *ka'kha-lasi* is taboo to some of the *Siem-lik* clans. Some of the War people must not eat *ka kiang* (preserved fish), and the clan *Khar-ma-wind* in Khyrim is debarred from the pleasure of partaking of pork. The flesh of the cow is *ming* to the *Khar* clan, although that of the male pig may be eaten.

DRINK

273 The Khasis are in the habit of regularly drinking considerable quantities either of a spirit distilled from rice or millet (*ka'ind pudhu*), or of rice-beer, which is of two kinds (1) *ka'ind kiaw*, (2) *ka'ind ses*. Both of these are made from rice and, in some places, from millet, and the root of a plant called *u khawiang*. *Ka'ind kiaw* is made by boiling the rice or millet. It is then taken out and spread over a mat, and, when it cools, fragments of the yeast (*u khawiang*) are sprinkled over it. After this it is placed in a basket, which is put in a wooden bowl. The

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

The adoption of a female obviates the family dying out (*iap duh*), which to the Khasi is a very serious matter, inasmuch as there will then be no one qualified to place the bones of its members within the family tomb (*ka ka iap shiang*) and to perform the requisite funeral ceremonies. Amongst the Khasis no particular ceremonies are performed at the time of adoption; but some of the Syntengs observe a religious ceremony which consists largely of a feast to the clan-folk, at which liquor, rice, dried fish, and ginger are partaken of. Before the feast commences, each clansman is provided with a small gourd (*u blangi*) filled with liquor, a little of the latter is then thrown on the ground from the gourd, and the following words are uttered:—

"Oh, God! oh, Lord! oh, ruling King Siokoram, now the *pynrup ling* ceremony is about to be performed, let the ceremony be propitious, and let males and females (of the clan) increase in numbers, so that the clan may become great, and respected, and that intelligent male members may spring up." No such ceremony is, however, observed, it is understood, in the Nartiang and Rulang di-hinkiips.

In the case of a family being *iap duh* (extinct), the family property, according to Khasi custom, passes to the Siem. Therefore it is to the interest of the members of families to adopt a female, when such necessity arises. As there is no religious ceremony which is compulsory to the Khasis on the occasion of an adoption, perhaps we are almost justified in concluding that in former times the adoption custom did not exist, more especially as the Khasis possess a special word, *iap duh*, for describing a family the females of which have all died out; and it is affirmed that the Syntengs, for the Siems, to succeed to the property of such a family. The Syntengs custom of *'rup ling* may have been borrowed from the Hindus, when the Rajas of Jaintia became converts to that religion.

TENURE OF LAND AND LAWS REGARDING LAND.

Land in the Khasi Hills proper, i.e. land in the high plateau, is held somewhat differently from land in the Jaintia Hills and

I: Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

should be severed with one blow. As soon as the head was cut off there was a rush on the part of the sacrificers to see in which direction the head faced. If the head faced towards the north or west, it was considered an evil omen; if it faced towards the south or east, a good omen. The east is a lucky quarter amongst the Assamese also. The people ended up the proceedings by giving a long-drawn-out, deep-toned chant, or *hynkot*. Immediately after the ceremony was concluded hundreds of boats shot out from the numerous creeks, where they had been lying, and fished the river all night, the result being an immense haul, to the delight of the Lyngams, who were seen next morning roasting the fish whole on bamboo stakes, after which they consumed them, the entrails being eaten with great gusto. Such is the worship of the goddess of the Funatit.

Similar pujas take place among the people of Wir-ding (the valley of fire) before they fish in the Khai-mara river and elsewhere in the Khasi Hills. In the Jaintia Hills there is the *syntang*-worship of the Kopili river, which used to be accompanied by human sacrifices, as has been mentioned above, pp. 102-104. The Myntang river, a tributary of the Kopili, must also be annually appeased by the sacrifice of a he-goat. Numerous hills also are worshipped, or rather the spirits which are said to inhabit them. One of the best known hill godlings is the deity who is thought to inhabit the little wood close to the summit of the Shillong Peak. This deity is said to have been discovered by a man named "U Shillong," who gave his name to the Shillong Peak, and indirectly to our beautiful hill station. The Siems of Mylliem and Nongkrem reverence U'lei Shillong, and there are certain clans who perform periodical sacrifices to this god. Probably the origin of the superstitious reverence with which U'lei Shillong is held by the Siems of Nongkrem and Mylliem is that their hallowed [illegible] of which an account will be found in the folk-lore section, took her origin from a rock not far from the Shillong Peak in the Nongkrem direction.

Rabbong Hill, which is within full view of the Shillong Peak in an easterly direction, is also said to be the abode of a minor god who is periodically propitiated by the members of the Mawthoh clan of the Khyrim State with a he-goat and a cock.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

be a successful era in store for the people of the State. The goddess on this occasion may be regarded as a Khasi Demeter, although no myst rise form part of her services as at the Grecian Eleusis. The Nongkrem ceremony and dance (now held at Smit) take place in the late spring, generally in the month of May. A lucky day having been fixed, the Siem sends a ring of cane (*lyrwah*) by way of a summons to the people of every village in the State, at the same time informing them of the date of the puja, and requesting them to attend with their offerings, consisting of goats and different articles of food. In the meantime various pujas have been taking place in the house of *Ka Siem Sad*, the Siem priestess, which it would be tedious to describe in detail. The more interesting points only will be mentioned. A fortnight before the puja and dance at Smit the *sok-lôei*, or high priest, pours out libations of liquor in the *lyrwa-blong*, or place where the sacrificial goats are kept, and in front of the great post (*ôi diang ewing*, or Khasi *sak*), in the house of the Siem priestess. Dancing then takes place in front of the post. Later on the Siem, with the high priest and other attendant priests, walks with extremely slow gait to a small hill where a stone altar has been prepared, and sacrifices a cock in honour of *u'lei Shillong*, or the god of the Shillong Peak. A silver dish with powdered rice, liquor in a gourd (*ka'iad saw*), betel-nut, and some leaves of the Khasi *sak* (*diang ewing*), are also necessary adjuncts of the puja. A goat is then sacrificed, and the sacrifice is followed by a dance of twenty-two men armed with swords and shields and [illegible] they return to the house of the Siem priestess and execute another dance in the great courtyard. The Siem and certain selected persons dance in front of the *wisket lôei*, or holy post of Khasi *sak* inside the house of the Siem priestess, the dancers being entertained with dried fish and ginger. Then follows the great dance of girls and men in front of her house. The girls dance in the centre, taking such tiny steps, that the lifting of their feet from the ground is [illegible] imperceptible, the arms held down to the sides and the eyes demurely downcast. It is on this occasion that they wear the peculiar silver (and sometimes gold) crowns illustrated in the

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

be placed in the family tomb. There are special taboos for certain clans, of which the following are some examples. The clan Nongtathiang cannot eat the lemon, the Khar-umnuid clan must abstain from pork, the Cherra Siem family cannot eat dried fish, and the Siem family of Mylliem taboo the pumpkin. Possibly these taboos may be relics of totemism amongst these communities. The following are some of the other taboos, although some of them are but lightly regarded now-a-days.

(i.) To build a house with stone walls on all four sides.

(ii.) To use nails in building a house.

(iii.) To use more than one kind of timber in building the hearth.

(iv.) To build a house with resinous timber. Only the Siem family can use such timber.

(v.) To cut trees from a sacred forest.

(vi.) To take or give anything with the left hand.

(vii.) To step over any one's body.

(viii.) To kill any animal or bird without first throwing rice over its body.

(ix.) To drink the milk of a cow or goat.

(x.) To talk with any one, except with one of a man's or woman's fellow-workers, when the threshing of paddy is going on.

There are the following special taboos for pregnant women.

(a) To accompany a funeral procession.

(b) To finish any sewing she may have commenced before she became enceinte. There is a similar prohibition regarding the finishing of the plaiting of wicker baskets.

(c) It is easy for the husband of a pregnant woman to thatch the village or the house so much a hand, or to fix a handle to an axe or a dao.

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

quilt, made out of the bark of a tree, which is beaten out and then carefully woven, several layers of flattened bark being used before the right thickness is attained. This quilt is called by the Lyngams "*Ka sylla*" (Garo *simpak*). Food is cooked in earthen pots, but no plates are used, the broad leaves of the *mariang* tree taking their place. The leaves are thrown away after use, a fresh supply being required for each meal.

The Lyngams brew rice beer, they do not distil spirit; the beer is brewed according to the Khasi method. Games they have none, and there are no jovial archery meetings like those of the Khasis. The Lyngam methods of hunting are setting spring guns and digging pitfalls for game. The people say that now the Government and the Siem of Nongstoin have prohibited both of these methods of destroying game, they no longer employ them. But I came across a pitfall for deer not long ago in the neighbourhood of a village in the Lyngam country. The people declared it to be a very old one; but this I very much doubt, and I fear that these objectionable methods of hunting are still used. The Lyngams fish to a small extent with nets, but their idea of fishing, *par excellence*, is poisoning the streams, an account of which has already been given in this monograph. The Lyngams are omnivorous feeders, they may be said to eat everything except dogs, snakes, the *hulock* monkey, and lizards. They like rice, when they can get it; for sometimes the out-turn of their fields does not last them more than a few months. They then have to fall back on *Job's tears* and millet. They eat swans largely, and for vegetables they cook wild plantains and the young shoots of bamboos and cane plants. The Lyngams are divided up into exogamous clans in the same manner as the Khasis. These clans are everywhere families. The Lyngams have some stories regarding the founders of these clans, of which the following is a specimen:—"A woman was asleep under a *sohbar* tree in the jungle, a flower from which fell on her, and she conceived and bore a female child who was the ancestress of the Nongsohbar clan." Some of the stories of the origins of other clans do not bear repeating. There do not appear to be any hypergamous groups. As with the Khasis, it is a deadly sin to

won the money in the archery contest and now we should have a big feast. It is full moon now and much more beautiful during the night than the day. Oh, we are just having a good time." At once he swung his bunches of leaves and hopped away. The women take care of stirring the cooking pots. They are not choosy about the spoon. A bamboo, which a tired dancer might have just thrown away, is quite adequate for this purpose. When everything is ready, the people sit down in groups and eat the meat. Rice brandy is handed around. When the archers and other guests at the festival are more than sated and exhausted from all the dancing, they leave the place towards morning. 527

It should be pointed out that contrary to their usual customs the Khasi eat no rice at the great feast after the archery competition but only meat, with which brandy is drunk. There is a good deal of overindulgence in food and drink on this occasion. (32) [262]

4. Hunting Customs

Although there are all sorts of wild animals in the Khasi Hills and Jaintia Hills that can be hunted -- flying foxes which visit the orange gardens during the night, jackals, which annoy the villages with their howling, antelopes, does, deer and wild pigs which damage the rice fields, wild dogs, wolves, 224

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

291 small kilt), and a cap which is peaked in front and which comes dow
well over the ears, called (*ka tapin ekhor*) ear cap. The dress of G
Khasi females is somewhat different from that of the Synteng, the fo
mer wears a striped cloth tied round the waist, hanging down to th
knees, and another cloth, with a fringed border, knotted on both th
shoulders to cover the bust and a narrow cloth, called *ka jymphen*, t
serve the purpose of under-clothing. A cloth knotted in front is al
worn like a cloak over shoulders. The Synteng woman wears a clot
smoothed round the body fastened above the bust and drooping dow
to the ankles. Another cloth is thrown over the shoulders, and cross
in front. Both Khasi and Synteng women wear a cloth tied over th
head, called *ka tep mukhlieh*. Up-to-date Khasi males wear knicke
292 bockers, stockings, and boots, and females chemises. On festive oc
sions, both Khasis and Syntengs, males and females, wear expensive silk
with earrings of gold or silver. There is a special dancing-dress
301 elaborate pattern. The women at festivals wear a circlet of silver wi
a spear-head ornament behind, rising 4 or 5 inches from the back
the head. Large coral beads are much valued, and necklaces of alte
nate beads of coral and gold, and sometimes of coral alone, are worn b
the chiefs and their principal followers. Such necklaces are worn b
• 262 women also on *pels* occasions. The staple diet of both Khasis a
Syntengs is rice and dried fish. They are, however, fond of all kin
of meat, especially pork. Some of the Syntengs abstain from be
[77] owing no doubt to Hindu influences. Neither Khasis nor Syntengs e
dog, which is partaken of with zest by the Nagas and the Garo tribes,
this is owing to the dog being considered by the Khasis to be the frie
of man. Neither Khasis nor Syntengs use milk, the latter bei
thought by them to be an excrement. Neither Khasis nor Synten
411 tattoo. The weapons of both Khasis and Syntengs are bows and arrow
swords and shields. The national game of the Khasis is archery, regar
ing which a detailed description will be found in paragraph 10.

The people live in regular villages on fixed sites which have
64 changed for generations,—some body appears to be somewhere in the
sites, where, as a rule, the family tombs are standing. The houses ar
342 built in the shape of a shell, the houses being divided into three compart
ments,—the *Shyngkep*, or porch, where cobs and ends, and sometime
fowls, are kept; *nongpei*, or centre room, which is used for cooking an
sitting in; and *rumpei*, or inner room, where the people sleep. Th
houses are low, with grass roofs reaching nearly to the ground, th
beams are of hewn timber, the walls are of either planks roughly hew
or of reeds or split bamboos plastered with clay. The Khasis' house
generally have boarded floors raised some feet from the ground leve

16McCormack E-4,5 (1956-1958) 1964
[PIOGA] AR7 Khasi AR7

manured chemical fertilizers. Both level land and 241
hillsides are cultivated by the same hand techniques. 3 × 6-foot patches are fashioned with walkways between; weds are overturned within the patches and allowed to dry, the weds are burned slowly and the ashes spread over the soil, and finally the soil is turned either broadcast or rank with the aid of the typical Khasi hoe. The coldest part of the upland enjoy a two-crop year, and Khasis often double
crops well. Paddy has long been found in the 243
lowlands, in parts of Jaintia and Shillong, the only 184
place where the plow is found. Nowadays paddy is 178
manured more area in the uplands, together with a side terracing and irrigation technology. Many
upland Khasis have home gardens in which they 244
raise wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and
241
many others. Important crops in Shillong country
are rice, tea, cassava, cotton, bananas and 184
pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. Fishing and hunting. Fish-
226
ing done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting is formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always
224
primarily a sport. [Cf. Stagemeier 1958.] Gathering.
222
Khasi-men gathered about 100 species of wild plantmen of them for food, but some for medicine. Thirl villagers still gather food plants, but there is
[278]
no or dependence on gathering. Medicinal plants
231
seem to be very important. Domestic animals. Fowl, pigs, and cattle are bred both for meat and
[234]
milk. Milk was formerly not utilized, but is now popular that specialists keep herds of milch
[235]
cowings are used as village scavengers, but some also raise prepared food. Cattle and goats range freely the fields during the winter, but are herded
[235]
by communally hired herdsmen during the agricultu season. Most households keep chickens, gathering their eggs, and a few keep ducks. A few
262
households also own. Dogs are portable, except for hunt dogs. Cats are popular. Food and stimulants.
The rice food of Khasis is boiled rice, together with the dri fish which is imported from Indian. Boiled

276
common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also
smoked as cigarettes and in hookah and other pipes.
Every village has one or more household taverns,
274
where distilled rice whisky is smoked and sold by the
276
glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls
instituted in the 1960s have been fairly successful.
276
All stimulants were once taken by men, women, and
177

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

428 to the sisters of his wife, or to her nearest relatives if there are no sisters. The rank and titles of a deceased male descend to his brother; when no brother exists, then to the male children of his mother's sisters (maternal aunts); should the maternal aunts have no male children living at the time, then to the eldest male child of his sisters. When no relatives are to be found, the property of the deceased goes to the ruler of the country; or if a man dies leaving no relative other than wife and children, *i.e.* no relatives on the mother's side, the property in this case also goes to the ruler, who, as the wife and children cannot preserve the ashes of the deceased, takes charge of them, and for so doing takes all the property also. With regard to the inhabitants of the Lower Hills at Sheilá, the custom as to succession is as follows:—Property belonging to a subject of Sheilá is divided into two classes—(1) Property inherited from ancestors, which descends to the nearest of kin or to the relative of a deceased person who can perform his obsequies. (2) Property acquired during the lifetime of the holder, which is inherited by the children, whose duty it is to provide for the maintenance of their mother until she re-marries or dies."

434 465 MATERIAL CONDITION OF THE PEOPLE.—The Khásis and the Syntengs are as a people prosperous. Common labourers, if adult males, can earn wages as high as one shilling per diem, and adult 342 females as high as eighpence. The dwellings of the well-to-do classes are generally constructed of masonry, with thatched roof and 152 plank floor, and divided into two or three rooms. The furniture consists of a bedstead (*phoyphi*), a mat or two (*mawi*), some cooking 342 utensils, and a few boxes. The ordinary peasants and poorer 184 classes construct their huts of cane, mud, or plank walls, with a thatch or cane roof. These are fitted with wooden platforms or boxes, planks placed on the ground to serve as beds. The food 262 of the well-to-do classes consists of rice, fish when obtainable, fowl 434 or meat, curry, vegetables, oil, bag's lard, fermented and spirituous liquor. It may be estimated that the living expenses of an average-sized household of this class would be about Rs. 25 or £2, 10s. a month, valuing the articles of consumption at *bázár* prices. An ordinary husbandman or labourer lives on rice, dry fish, occasionally a 276 little meat, oil, or bag's lard. *Pán* leaf, betel-nut, and lime are essential to the comfort of all the hill people, who are inveterate chewers of *pán*. They commence at an early age, and are rarely seen without a *pán* leaf in their mouths; the females are quite

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

361 In the interior of the Hills the largest villages are mere clusters of
463 huts. The great majority of the inhabitants are employed in agriculture, but there are no data upon which a proportion of agriculturists to non-agriculturists could be based.

167 There is no immigration into the District. Both the Khásás and
198 the Syntengs have been successful in preserving to the present day their primitive isolation, free from the interference of Hinduism. They still maintain their aboriginal forms of belief and religious worship, and repudiate alike the authority of Bráhmans and
[771] [262] the entire system of caste. To some extent, however, they have given way to Hindu prejudices in the matter of purity of food. The
[563] few Hindus to be found in the Hills are temporary residents, engaged in civil and military employ, who always contemplate returning
[441] to their own homes. The traders are for the most part natives of the Hills; for the Márwári merchants, who penetrate into every other corner of Assam, have been able to obtain no footing in the face of Khásí competition. There is likewise no emigration from the District. The hillmen are a well-to-do and contented race, and either produce themselves or obtain by trade sufficient to satisfy
[166] their scanty wants. A certain number of both Khásás and Syntengs proceed southwards every year to work on the tea gardens of Cáchár and Sylhet, but such absence from home is only temporary.

243 AGRICULTURE: RICE.—Thirteen different varieties of rice are cultivated in the District, of which the following is a list, giving the Khásí name as well as the description of the grain:—(1) *U-kyba-khyrieew* (*u*, the masculine article, meaning 'the,' and *kyba*, meaning masculine, meaning 'paddy'), brown rice with long grain; (2) *u-kyba-khyrieew-kai-tik*, a white rice with long grain; (3) *u-kyba-kaiwit*, round-grained rice; (4) *u-kyba-kaai*, bearded, bushed; (5) *u-kyba-dew-ka-iong*, black bushed rice (literally *u* = 'the,' *kyba* = 'paddy,' *dew* = 'earth,' *ka* = 'that,' *iong* = 'black'); (6) *u-kyba-ka-tik*, white rice; (7) *u-kyba-sein*, scented rice (literally *u* = 'the,' *kyba* = 'paddy,' *sein* = 'royal'); (8) *u-kyba-ka-kwak*, large-grained rice; (9) *u-kyba-ka-diang*, small-grained rice; (10) *u-kyba-sa-kin*, early rice; (11) *u-kyba-ra-kem*, late rice; (12) *u-kyba-kang-ka*, rice grown along with beans; (13) *u-kyba-ka-tik*, small rice.

Rice is cultivated in marshy fields situated near running water as well as in high lands. The first seven of the above thirteen species of rice are sown in marshy lands during the months of April and May,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

243 the District, nor do any superior kinds of cereals appear to have been substituted for inferior ones.

THE DIFFERENT STAGES OF RICE CULTIVATION, in English and Khási, are as follow:—The blade as it first shows, *ipuh-u-kyba;* the blade when well above the ground, *la-thyllang-u-kyba;* the ears when first formed, *law-mat;* the ears beginning to ripen, *kyr-tew;* the ripe ears, *la-kik;* unhusked rice, *u-kyba;* husked rice, *u-khaw;* cooked rice, *ka-ja.*

262 [435] [782] THE VARIOUS SOLID AND LIQUID PREPARATIONS made from rice are the following:—(1) *U-kypu*, cakes of different kinds, sold at six or twelve for a penny, according to size. (2) *U-khind* or *gih-khir*, prepared by the hillmen as an offering to their deity at the conclusion of the harvest. (3) *Kindaw*, fermented rice water, sold at the rate of from three-farthings to threepence per quart, according to the strength of the liquor. (4) *Ka kind phatiks* or *ka kind-khrah*, a kind of spirits distilled from rice, and sold at from threepence to fourpence-halfpenny per quart.

273 435

243 OTHER CEREALS.—Indian corn, or *u-rie-ka-dew*, is grown on homestead lands. The ground is first manured, and the seed is sown about the middle of April. The crop is fit for cutting in September and October. A kind of millet seed called *u-krái* is commonly sown with paddy on high lands. For want of more suitable land, however, this crop is often cultivated by itself on rocky slopes; and when this course is adopted, the jungle is first cut down in February and burnt. The seed is sown in April, and the crop gathered in December.

244 PULSES AND FIBRES.—Only two kinds of pulses are grown in the Hills, *u-rym-kai-dong* and *u-rym-kai-jil*, both of which are varieties of beans. They are sown on high lands in March and April, and gathered in December. The only fibre is that made from the pine-apple stalk, which is largely used for making netted bags.

235

245 [439] MISCELLANEOUS CROPS.—(1) Oranges.—There are numerous orange plantations in the neighbourhood of Cherra Pínji, and the fruit is exported to all parts of Bengal. In the year 1876-77 the estimated exports were 9,400,000 in number, valued at Rs. 37,600, or £3760, at the rate of Rs. 12 or £1, 4s. per three thousand. These figures show a decrease in number as compared with the estimated export twenty years ago. The trees flower in March or April, and the fruit ripens in October and the following months. In some cases the oranges are allowed to remain on the trees till March, but

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

231 (£174, 8s.) was expended on the purchase of stock, including
648 cattle, sheep, and pigs from England. Even native cattle at the
654 elevation of Shillong fall off very much in the months of January and February from want of forage, and the Khásiás at this season generally drive them to lower slopes. But one of the chief objects in keeping cattle at the farm was to obtain manure; and *moti haldi* (Phaseolus radiatus) was grown for them, cut green, and stocked
[731] for food. On this they did very well. In 1875-76, however, cattle disease broke out on the farm in a very virulent shape. Out of 39 cattle attacked, only 7, or 18 per cent., recovered, and the animals imported from England all died. There was also a heavy mortality in that year among the sheep and pigs. The following are the financial results for the two years:—1874-75—Expenditure, Rs. 13,297. 0. 5; receipts, Rs. 309. 2. 6: deficit, Rs. 12,987. 13. 11. 1875-76—Expenditure, Rs. 11,445. 8. 6; receipts, Rs. 1036. 15. 0: deficit, Rs. 10,408. 9. 6. Total deficit, Rs. 23,396. 7. 5, or £2339.
648 13s. In view of these figures the Chief Commissioner has deter-
654 mined to restrict farming operations to small experiments in irrigated *rabi* crops, and, as a measure of economy, to dispense with the services of the superintendent. The future expenditure on the farm will be insignificant. The establishment now (1877) consists of a *sardár* on Rs. 30 and a *chaukidár* on Rs. 10 a month (total, £72 a year), under the direct control of the Deputy-Conservator of Forests; the total number of live-stock is 64 head.

731 NATURAL CALAMITIES, such as blights, floods, or droughts, are not common in the District, although the crops in the Jáintiá Hills sometimes suffer from insects. So far as the Deputy-Commissioner is able to ascertain, no destruction of crops affecting the general harvest has occurred within the experience of the present generation.
[435] During the Orissa famine of 1866-67 the maximum price of common rice reached £1 per hundredweight, but no such distress was felt as to require Government relief operations. The price just mentioned was certainly equal to the rates prevalent in the famine-stricken localities; but prices always rule high in the Hills, and afford no just criterion of the state of affairs among the general body of the inhabitants. Distress was only felt by a small portion of the population, chiefly the Bengáli immigrants residing in the District, who are generally a well-to-do class. The Hill people, as a rule, do
262 not eat potatoes, which they grow only for export; but in case of
244 actual famine, they might fall back upon this crop for their own food
439 supply.

extracted by squeezing the comb with the hand. Wax is 231
obtained by placing the comb in boiling water and allowing it to cool, when the wax floats to the surface. The Khasis do not systematically tend their bees, as they do not understand how to prevent swarming, and as the Khasi bee is a prolific swarmer, hives become weak very soon and a new hive has to be started from a captured natural swarm. The villages in which bees are regularly kept to any large extent in the Khasi and [938]
Jaintia Hills are Thied-dieng, Mawphoo, Nongwar, Mawlong, Pynter, Tyrna, and Kongthong, but most of the Wár villagers rear bees and sell the honey at the neighbouring markets. The collection of the honey of the wild bee, or *u lywai*, is a hazardous occupation, the services of some six or seven persons being required, as the combs of this bee are generally built in the crevices of precipitous rocks, and sometimes weigh more than half a maund each. When such hives are discovered the bees are driven out by the smoke of a smouldering fire lit at the foot of the rock below the hive. Two or three men get to the top of the precipice, leaving two or three of their companions at the base. One of the men on the top of the rock is then lowered down in a sling tied to a strong rope, which is made fast by his companions above to a tree or boulder. The man in the sling is supplied with material to light a torch which gives out a thick smoke, with the aid of which the bees are expelled. The man then cuts out the comb, which he places in a leather basket or bag, which, when filled, he lowers down to the persons in waiting at the foot of the rock. The wild honey may be distinguished from that of the domestic bee by being of a reddish colour. Honey from the last-mentioned bee is gathered twice or thrice in the year, once in the autumn and once or twice in the spring; that gathered in early spring is not so matured as that collected in autumn. The flora of the [939]
Khasi Hills being so numerous, there is no necessity for providing bees with artificial food. The bees are generally able to obtain their sustenance from clover, anemonies, "golden rod," bush honeysuckle, and numerous shrubs such as andromeda, daphne, &c., which abound about Shillong. There seem to be facilities 231
for apiculture on a large scale in these hills, and certainly the 263
honey which is brought round by the Khasis for sale in

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

231 Shillong is excellent, the flavour being quite as good as that
• 243 of English honey. Under "Miscellaneous Customs connected
with Death" will be found a reference to the statement that the
[764] dead bodies of Siems used to be embalmed in honey. The
existence of the custom is generally denied by Khasis, but
its former prevalence is probable, as several trustworthy
authors have quoted it.

HOUSES.

342 The houses of the people are cleaner than might be supposed
515 after taking into consideration the dirtiness of the clothes and
persons of those who inhabit them. They are as a rule sub-
stantial thatched cottages with plank or stone walls, and raised
on a plinth some 2 to 3 ft. from the ground. The only
354 window is a small opening on one side of the house, which
admits but a dim light into the smoke-begrimed interior. The
beams are so low that it is impossible for a person of ordinary
stature to stand erect within. The fire is always burning on an
earthen or stone hearth in the centre. There is no chimney,
the smoke finding its exit as best it can. The firewood is
placed to dry on a swinging frame above the hearth. In the
343 porch are stacked fuel and odds and ends. The pigs and calves
342 are generally kept in little houses just outside the main
building. The Khasi house is oval-shaped, and is divided
into three rooms, a porch, a centre room, and a retiring-
room.

354 In olden days the Khasis considered nails *ong*, or taboo, and
784 only used a certain kind of timber for the frames which sur-
rounds the hearth; but they are not so particular now-a-days.
In Mawkhar, Cherrapunji, and other large villages, the walls of
342 houses are generally of stone. In Cherrapunji the houses are
frequently large, but the largest house I have seen in the hills
is that of the Doloi of Sohtinga in the Jaintia Hills, which
measures 74 ft. in length. The house of the Siem Priestess at
Smit in the Khasi Hills is another large one, being 61 ft. long
by 30 ft. broad. In front of the Khasi house is a little open-
fronted in on two sides, but open towards the village street. The

and placed in the hollowed-out trunk of a tree, *ka-shyopid*, there being a small hole with a plug at the bottom of this receptacle. Spirit is then poured into the *shyopid* until the whole body is immersed, the liquor being allowed to stand for three days. After the body has been thus steeped, the liquor is allowed to run out, and the body is washed with warm water, after which it is allowed to dry for a day. Then a quantity of lime-juice is poured in, the latter being obtained from the fresh fruit of the lime (*u sah jew*). The body is thus exposed to a process of pickling, which continues until the whole is thoroughly dry and becomes like that of a mummy. It is then placed in a coffin, which is kept in the house of the Siem family until it is time to perform the funeral obsequies. These ceremonies entail a very large amount of expense, and it sometimes happens that they cannot be completed for some years after the death of a Siem. The body of a deceased Siem according to the Cherra custom should be burnt by his successor; otherwise the latter is not Siem according to the Khasi religion. The last Siem of Cherra, U Hajon Manik, did not perform the funeral obsequies of his predecessor, U Ram Singh, and it is stated that many of his subjects did not regard him as Siem, according to the Khasi religion, in consequence. There are at the present time the corpses of two Siems of Cherra which have been preserved in the manner described above, awaiting cremation. The first Siem, U Ram Singh, died so far back as 1875, and the second, U Hajon Manik, died in 1901.

Sir Joseph Hooker and other authorities have stated that the bodies of deceased Siems of Cherra used to be embalmed in honey, and an amusing story is told regarding the necessity of exercising caution in purchasing honey from Cherra (honey being plentiful in this neighbourhood), except in the south, for fear of honey which has been used for embalming purposes being passed off on the unwary purchaser. But the members of the Siem family and the old residents deny that honey is used for this purpose nowadays, possibly in the interests of the trade. It is, however, not unlikely that honey was so utilized in days gone by, as it is a well-known agent for embalming. The bodies of priests in Burmah are said to be embalmed in honey, *vide* Yule's "Embassy to Ava."

cartridge all the fish within a certain area are killed, none escape. When poisons are used, however, some fish are not affected by them, and others are only stupefied for the time being and afterwards recover. 226

FOOD.

The Khasi and Syntengs ordinarily take two meals a day, one in the early morning and the other in the evening, but labourers and others who have to work hard in the open take a midday meal as well, consisting of cold boiled rice wrapped in a leaf (*ka já-sang*), cakes (*ki kpu*) and a tuberous root (*u sohphlang*) which is eaten raw. They are fond of all kinds of meat, especially pork and beef, although some of the Syntengs, owing to Hindu influence, abstain from eating the latter. Unlike the neighbouring Naga, Garo and Kuki tribes, the Khasis abstain from the flesh of the dog. Both Bivar and Shadwell say the reason why the Khasis do not eat the flesh of the dog is because he is in a certain sense a sacred animal amongst them. There is a Khasi folk-tale relating how the dog came to be regarded as the friend of man. It is, however, quite possible that the Khasis may never have eaten the flesh of the dog from remote times, and it is nothing extraordinary that the Khasis should differ in a detail of diet from the neighbouring Thibeto-Burman tribes which are so dissimilar to them in many respects. The Khasis, except some of the Christian community and some of the people of the Mawkhar, do not use milk, butter, or ghee as articles of food. In this respect they do not differ from the Kacharis and Rabhas of the plains or the Garos of the hills. The Mongolian race in its millions as a rule does not use milk for food, although the Tibetans and some of the Turcoman tribes are exceptions. Before fowls or animals are killed for food, prayers must be said, and rice sprinkled on the body of the animal. The staple food of the Khasis is rice and dried fish. When rice cannot be obtained or is scarce, millet or Job's tears are used instead. The latter are boiled, and a sort of porridge is obtained, which is eaten either hot or cold according to fancy. Khasis eat the flesh of nearly all wild animals, they

264 262 262 825 262 [782]

19: McCormack E-4,5 (1956-1958) 1966
[P. 108A] AR7 Khasi AR7

more and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, soils are overturned within the patches and allowed to dry, the soils are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sown with the aid of the typical Khasi hoe. The coldest part of the upland region a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Sibsi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplants, and many others. Important crops in Sibsi country are paddy rice, tea, sarsaparilla, cotton, bananas, and pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stagmiller 1968.] **Gathering.** Khasis once gathered about 190 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but sometimes receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsman during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are partials, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Sibsi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

which are not found usually in the people of India. Hills not above normal labour, and even the Khasi clerk in the Government office is quite ready to take his turn at the hoe in his private garden. The men make excellent stonemasons and carpenters, and are ready to learn heavy carpentry and mechanical work. They are inveterate chewers of betel and the pan leaf (when they can get the latter), both men, women, and children; distances in the interior being often measured by the number of betel-nuts that are usually chewed on a journey. They are not addicted usually to the use of opium or other intoxicating drugs. They are, however, hard drinkers, and consume large quantities of spirit distilled from rice or millet. Rice beer is also manufactured; this is used not only as a beverage, but also for ceremonial purposes. Spirit drinking is confined more to the inhabitants of the high plateaux and to the people of the War country, the Bhoia and Lyngngam being content to partake of rice beer. The Mikiew who inhabit what is known as the "Bhoi" country, lying to the north of the district, consume a good deal of opium, but it must be remembered that they reside in a malarious terai country, and that the use of opium, or some other prophylactic, is probably beneficial as a prevention of fever. The Khasis, like other people of Indo-Chinese origin, are much addicted to gambling. The people, and especially those who inhabit the War country, are fond of litigation. Col. Rivet remarks, "As regards truthfulness the people do not excel, for they rarely speak the truth unless to suit their own interests." Col. Rivet might have confined this observation to the people who live in the larger centres of population, or who have been much in contact with the denizens of the plains. The inhabitants of the far interior are, as a rule, simple and straightforward people, and are quite as truthful and honest as peasants one meets in other countries. My impression is that the Khasis are not less truthful certainly than other Indian communities. McCosh, writing in 1837, speaks well of the Khasis. The following is his opinion of them:—"They are a powerful, athletic race of men, rather below the middle size, with a manliness of gait and demeanour. They are fond of their mountains, and look down with contempt upon the degenerate race of the

1:Garden E-4, 5 (no date) 1907 AR7 Khasi AR7

262. also eat field rats and one kind of monkey (*u shi*). The Syntengs and Lyngngams are fond of tadpoles, and the Khasis consider a curry made from a kind of green frog, called *ka jaynik*, a luxury *ki ulu*. They, however, do not eat ordinary frogs (*jaboid*). The Khasis of Marias, Maharam, Nongstoin and some other Siemships eat the hairy caterpillar, *u kiang phlang*.

262. 262. A staple food which must not be forgotten is the inner portion of the bark of the sago palm tree, *ka tiki*, which grows wild in the forest and attains a large size. The tree is felled and the outer bark removed, the soft inner part is cut into slices, dried in the sun, pounded in a mortar and then passed through a fine bamboo sieve. A reddish flour is obtained, of sweet taste, which is boiled with rice. This flour is said to make good cakes and puddings.

263. 264. Although the Khasis are such varied feasters, there are some clans amongst them which are prohibited by the ordinance of *niang*, or taboo, from eating certain articles. The following are some instances:—

The Chawra Siem family cannot eat dried fish (*khi-pud*); the Siem of Mylliem must not eat the gourd (*u pathie*); a fish called *ka'khi-lawi* is taboo to some of the *Siem-lik* clans. Some of the War people must not eat *ka khang* (preserved fish), and the clan *Khar-ma-lad* in Khyrim is debarred from the pleasure of partaking of pork. The flesh of the sow is *niang* to the *Khar* clan, although that of the male pig may be eaten.

DRINK.

273. The Khasis are in the habit of regularly drinking considerable quantities either of a spirit distilled from rice or millet (*ka'iad pudhi*), or of rice-beer, which is of two kinds (1) *ka'iad kiew*, (2) *ka'iad ses*. Both of these are made from rice and, in some places, from millet, and the root of a plant called *u khawiang*. *Ka'iad kiew* is made by boiling the rice or millet. It is then taken out and spread over a mat, and, when it cools, fragments of the yeast (*u khawiang*) are sprinkled over it. After this is in placed in a basket, which is put in a wooden bowl. The

Ir Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

basket is covered tightly with a cloth so as to be air-tight, and it is allowed to remain in this condition for a couple of days, during which time the liquor has oozed out into the bowl. To make *ka'iad* use the material, the rice or millet from which the *ka'iad kiar* was brewed, is made use of. It is placed in a large earthen pot and allowed to remain there for about five days to ferment, after which the liquor is strained off. *Ka'iad kiar* is said to be stronger than *ka'iad* use. The former is used frequently by distillers of country spirit for mixing with the wort so as to set up fermentation. The people of the high plateaux generally prefer rice spirit, and the Wáin of the southern slopes of the Khasi and Jaintia Hills customarily partake of it also. The Khasis of the western hills, e.g. of the Nongstoin Siemship, and the Lyngngam, Bhoin, Lalungs, and Hadems almost invariably drink rice-beer, but the Syntengs, like the Khasi splendors, drink rice-spirit. Rice-beer (*ka'iad use*) is a necessary article for practically all Khasi and Syntengs religious ceremonies of importance, it being the custom for the officiating priest to pour out libations of liquor from a hollow gourd (*u Blang*) to the gods on these occasions. As there is no Excise in the district, except within a five-mile radius of Shillong, liquor of both the above descriptions can be possessed and sold without restriction.

According to some Khasi traditions, the Khasis in ancient times used not to drink spirits, but confined themselves to rice-beer. It is only in the last couple of generations that the habit of drinking spirits has crept in, according to them. From Khasi accounts, the use of spirits is on the increase, but there is no means of testing these statements. There can be no doubt, however, that at the present time a very large amount of spirits is manufactured and consumed in the district. The spirits is distilled both for home consumption and for purposes of sale; in some villages, e.g. Mawlai and Marbisu, near Shillong, where there are fifty-nine and forty-nine stills respectively, there being a still almost in every house. Mawlai village supplies a great deal of the spirit which is drunk in Shillong, and from Marbisu spirit is carried for sale to various parts of the hills. Other large distilling centres are Cherrapunji, with forty-seven stills; Jowai, with thirty-one stills; Laitkynsew, with fifty-four stills;

274 Sangwar, thirty-one stills; and Rangthang, thirty-seven
975 stills.

From what has been stated above some idea may be gathered
279 how very large the number of stills in the Khasi and Jaintia Hills is. I am not in a position to state with any degree of accuracy what is the amount of spirit manufactured or consumed in the year, but it is very considerable. The out-turn of a Khasi still has been reckoned at from four to eight bottles per day. From this estimate, and the fact that there are 1,350 stills in the district, it may be roughly calculated what is the consumption annually. Practically the whole of the spirit is consumed within the district. The liquor which is manufactured is far stronger than the spirit distilled in the ordinary out-stills in the plains.
273 It has been stated by an expert analyst that the Khasi spirit
975 contains 60 to 80 per cent. of proof spirit, and that it possesses "an exceptionally nice flavour and taste." The usual price at which it is sold is 4 to 6 annas a quart bottle, a second quality being sometimes sold for 3 annas. It will be seen that the
[41] liquor is exceedingly cheap. A Khasi in the villages of the interior can get drunk for 2 annas,* or a quarter of an ordinary coolie's daily wage. Drunkenness prevails on every market day at Cherrapunji, Jowai, and other large hats, and on occasions when there are gatherings of the people for various purposes. This cheap but strong spirit is demoralizing the people, and some restriction of its use would be welcomed by
273 many. In the Khasi Welsh Methodist Church abstention from
999 liquor is made a condition of Church membership, but the vast number of stills and the facilities with which liquor can be obtained are a constant source of temptation to the Christian community, and cause many defections.

GAMES.

276 The Khasis have many games, but their principal game is archery, this may be said to be the national game, and is a very popular form of recreation amongst them, the sport being indulged in from about the beginning of January to the end of

* About threepence.

Ic Gordon K-4, 5 (no date) 1907 AR7 Khasi AR7

having heated a lump of iron red hot in a furnace, induced the snake, at the usual signal, to open his mouth, and then threw in the red-hot lump, and so killed him. He proceeded to cut up the body, and sent pieces in every direction, with orders that the people were to eat them. Whenever the order was obeyed, the country became free of the ñiáw, but one small piece remained which no one would eat, and from this sprung a multitude of ñiáws, which infest the residents of Cherra and its neighbourhood. When a ñiáw takes up its abode in a family there is no means of getting rid of it, though it occasionally leaves of its own accord, and often follows family property that is given away or sold. The ñiáw attaches itself to property, and brings prosperity and wealth to the owners, but on the conditions that it is supplied with blood. Its craving comes on at uncertain intervals, and manifests itself by sickness, by misadventure, or by increasing poverty befalling the family that owns the property. It can only be appeased by the murder of a human being." The murderer cuts off the tips of the hair of the victim with silver scissors, also the finger nails, and extracts from the nostril a little blood caught in a bamboo tube, and offers these to the ñiáw. The murderer, who is called a nongbakhah, literally, "the hunter," before he sets out on his unholy mission, drinks a special kind of liquor called, in 'ual hang-ski-ewm (literally, liquor which has been kept for a year). This liquor, it is thought, gives the murderer courage, and the power of selecting suitable victims for the ñiáw. The nongbakhah then sets out armed with a short club, with which to slay the victim, hence his name nongbakhah, i.e. one who hunts; for it is forbidden to kill a victim on these occasions with any weapon made of iron, inasmuch as iron was the metal which proved fatal to the ñiáw. He also takes the pair of silver scissors above mentioned, a silver lancet to pierce the inside of the nostrils of the deceased, and a small bamboo or cylinder to receive the blood drawn therefrom. The nongbakhah also provides himself with rice called "u khaw dynthip," i.e. rice mixed with turmeric after certain incantations have taken place. The murderer throws a little of this rice over his intended victim, the effect of which is to stupefy the

[27]

this man and a number of followers, clothed in clean garments and wearing either white or red pagris (a black pagri not being considered a fitting head-dress on this occasion), to the house of the bride, where a feast has been prepared, and fermented rice-beer (*ka-khiel-kiar*) in gourds (*khong*) placed ready. The bride, her female attendants, and her mother and aunts have collected in the meantime, dressed in their best, wearing their jewellery, and with their heads uncovered, for it is not thought proper for the females to cover their heads on the marriage day. On the side of the bride, also, a *kniang* (go-between) has been appointed, and it is his duty to manage all the business of the marriage on behalf of her family. Some young men of the bride's party go to meet the bridegroom's contingent by way of doing them honour. When they have reached the bride's house, the *kniang* of the bridegroom enters first, followed by the bridegroom, and after him the bridegroom's party. The *kniang* then hands over the bridegroom to the maternal uncle (*kwi*) of the bride, or to the bride's father. Either of the latter then provides the bridegroom with a seat near the bride. The bride and bridegroom exchange bags of betel-nut, and where the custom of investiture of the ring is in vogue, these tokens are interchanged. The *kniangs* of the bridegroom and bride recite the marriage contract in lengthy formulae, which may be found on pages 6, 7, 8 of the late U Jaitan Roy's interesting notes on the Khasi religion. The two *kniangs* then take up, each of them, a gourd containing fermented liquor from the gourd provided by the contracting party, and give them to an old man who is versed in sacrificial lore, who solemnly mixes the contents together. Three dried fish are produced, and are placed on the floor of the house. The priest then appointed then solemnly adjures the gods in the following words :—

Hei, oh god from above; oh god from below; oh, *ka synthar*; oh god who best created man; as thou hast ordained this marriage, the ring has been given this day; thou will know; thou will hear; from the clear firmament above that . . . . have been married this day. Thou will bless them; thou will grant them prosperity; thou will show them the way; thou will show them the road, that they may be well, that they may obtain dwellings and houses,

R Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

LANDOH CEREMONY.

This ceremony is identical with that of *Pyniar synjat*, except that the bride and bridegroom do not interchange rings, and that there is no sacrifice of the pig. The parties merely buy some pig's flesh and perform a puja with a small portion of the flesh of the legs of the animal. Amongst the poor, fish sometimes takes the place of pork at the *Iedih-biad* ceremony. The latter consists of a drinking bout mingled with sentimental sentences by a *nongbiniu* (sacrificer), the invocations and prayers being the same as at the *Pyniar synjat*. The *Landoh* and *Iedih-biad* ceremonies take the place of the more elaborate *Pyniar synjat* in most places now-a-days.

LYNGAM MARRIAGES.

The ritual observed at these marriages is described as under:—First of all a proposal is made in the following manner. A *lyngap*, or go-between, is sent, with the brother of the girl for whom a husband is required, to the house of the father of the young man (not to the house of the mother as in the case with the Khasis). If the proposal is accepted, the father of the young man kills a pig, and gives a feast to the people of the village of his father-in-law elect; also to the go-between and the *lyngap* (brother of the bride). The father of the bride then gives a similar feast. A sum of Rs. 1 each is given as a present to the go-between by the fathers of the bride and bridegroom, and the father of the bride pays from Rs. 5 to Rs. 15 to the father of the bridegroom. Further feasting occurs at the house of the father of the bride. The go-between then sacrifices a pig and two fowls at the house of the bridegroom, and afterwards performs the same sacrifice at the house of the bride. At the house of the bride, after the fowls and the pig have been sacrificed, the go-between, after drinking liquor himself, pours out some on the floor of the house and then gives some to the bride and bridegroom to drink. The killing of the fowls, the sacrifice of the pig, and the libation of liquor are essentials at a Lyngam marriage. The sacrifice of the fowls is also an essential feature

I:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

764 house, a ceremony called "*Rih-tyngew*" is performed, which consists of driving out the devils from the house, so that they may not interfere with the peace of the spirits of the departed whilst they rest in the house, and on their journey to the tomb. All the men after they have performed this ceremony are given [675] a drink of rice-beer known as *'ied sanglah*. Another cock is sacrificed, and a small bamboo ladder of three rungs is prepared for the use of the spirits when climbing into the tomb. Rice is then thrown outside the door. The next morning they perform further sacrifices, which need not be detailed here, and let loose [763] a bull whose horns have been cased in silver. They dig two shallow tanks called *wadai*, into which is poured water supposed [764] to possess the virtue of purifying the bones of any deceased Khasiaus who have died violent or unnatural deaths, or at places far away from their homes, where it was not possible to perform their funeral ceremonies according to custom. Three vertical stones are also erected, called *mawwadai*. A bamboo with a white flag, and a plantain tree are set up; to the bamboo are attached three bamboo rings (*lyngwah*), which are supposed to act as summonses to the spirits of the departed who have not received the benefit of a proper funeral ceremony. It may be explained that this ring of bamboo or cane in the form of summons used by the Khasi chiefs to their subjects when they wish to call them before them. Then a cock, *u'lim wadai*, is sacrificed as a vicarious victim to bear the sins of the departed. When the procession reaches the *mawbjat* or *mawlyati* (the upright stones which have been erected), a goat called *u'lang mawlyati* is sacrificed. Then a bamboo is fixed to the centre one of the three upright stones, to which is attached the lower jaw-bone of one of the cattle sacrificed in the puja-house; this is called a *mawi mawlyati*. A special ceremony called *ka-lyngka-pongsei* is then performed for those of the clan who have died childless. We now come to the actual ceremony of placing the bones in the tomb of the clan. Having arrived at the tomb, the bones are washed three times in a dish (this is a Cherra custom). In Mawshai, the bones are exposed to the heat of a fire kindled on a small *jingthong*, or burning-platform. The stone door of the sinnemiem is then opened, and the bones of the female are placed in an earthen pot inside the tomb

764 Meanwhile others are completely occupied with the burning of the body. Soon the intestines pour out into the fire, whereupon they begin to sizzle. A horrible smell comes from the crackling intestines. The steam that is developing in the skull from the fire causes a violent explosion in the skull which sounds like a gunshot. After the pile of wood has burned down and the yellowish green smoke has gone, you still see in the bluish fire the outlines of the black, steaming and cooking corpse. Now the men, who are already quite drunk from rice brandy, poke around in the fire with bamboo sticks and pour liquor and oil on it, which causes the flames to blaze up again. I saw in Lamin at a cremation that the heart was left as the last thing, which was then burned by itself with great sadness on the [271] part of the crematore. The objectionable scene of cremation could not occur without an [272] excess taking of alcohol. As a conclusion a goat is sacrificed (u 'lang dhulia) on the spot and the relatives take their departure as they place betel nuts on the burned up funeral pyre with these words: khublei khie leit ban kwai ha ling u blei (god guard thee, go and eat betel nuts in the house of god!

In some places it is customary before the cremation for a man to get drunk with liquor. He then represents the devil and performs all sorts of tricks.

764 When the corpse is burned, one then col-
772 lects the remains of the bones which did not quite get burned up. (31) These are washed

31. Cf. Table III, Picture 1: Collecting the Remains and the Bones

765 ai ban ka ai sa ia me

our words and our sacrifices and out judgments and then will be: to care for thee and to nourish thee and to carry over thy bones and to care for thee in sickness and to make thee healthy. So we wish to drink the liquor and the water, is it no so! (32)

[279]

32. The water is a fermented rice water, that is variously called rice beer. The last sentence has the sense of an affirmation and of an oath.

Hoi ongew ryngkat me phi ka blei ka loubei ka nonglum nongkynshew shi khrum ka nar mo!

So hear then, o goddess, thou Jaubei, thou who has gathered us here, one and all (33) the whole sib

33. Shi khrum - actually the hollow place, the place under the house.

and stone and iron, is it not so!

764
782 As there are various customs for sacrifices, so are the ceremonies for cremation various. It is reported (34) that on the day of

34. Gurdon, The Khasi, p. 133.

cremation pigs are slaughtered by the relatives of the deceased. Those, who cannot afford to

526 meaning are placed next to each other usually
533 a nominative before the objective case (accusative--dative). These words form the frame for the words contained in the second (even lines) sayings.

The poem can be reproduced in the following way to make sense (only the even lines):

2. Let us stamp mightily so that the earth groans.
   So that it is known for certain that we have conquered.
4. Set up the bows, you brave youths!

6. Set up the bows so that the mighty victory shows.
8. Whoever dares to battle us, we will fix his comb.
10. May your mockery be sharp, the opponent must weep.
12. He must weep, his eyes weep, his nose runs.
14. Do not be sorry, comrades, it was so determined!

[522] (512) Singing in this way with mocking songs
526 to the defeated opponent, shouting and rejoicing, the crowd moves across the place of the
• 273 festival. Liquor is brought an' drunk jealously, only too zealously, so that the crowd lighted by the torches, aroused by the battle, and excited by the shouting competition, takes a wild impression. The raw, wild joy breaks forth in a deafening racket. Finally tired of the rushing around they return slowly but still shouting to their village, and scatter to their huts, still disputing violently about the happenings.

526 The end of an archery contest varies

of Gordon G-3 (no date) 1904 AR7 Khasi AR7

—the *Slyngkop*, or porch, being flush with the ground. The *ompoi*, or centre room, is approached by a flight of steps. There are no windows, except one, which is bored on one side to admit light and air,—this is called the *ponphai*. Both Khasis and Syntengs, like other Indo-Chinese races, are much addicted to gambling, and drinking to excess is a national vice. Christianity has, through the agency of the Welsh Calvinistic Mission, gained a very striking extension, and may be said indeed to be leavening the whole nation. Schools are numerous, and are pretty well attended by girls as well as boys. The Christians, and those who have come under the influence of Christianity, have adopted a high standard of comfort, and their houses resemble English cottages more nearly than the huts with which one is familiar in India.

Agriculture.—The Khasis do not use the ploughs; they cultivate their fields with a peculiar-shaped hoe, or *mukkhow*. They cultivate rice in the valleys, the rice being sown broadcast and the fields irrigated often after considerable labour. They also cultivate hill rice on the uplands, which they sow broadcast. The potato, which was introduced into the Khasi Hills by Mr. David Scott about the year 1830,[1] is extensively cultivated and forms one of the principal articles of export. *Job's-tears* (*Coix lachryma*), several kinds of millet, Indian-corn, the *Sohphlang* (*Flemingia vestita*), are also largely cultivated. The valleys on the southern slopes of the hills have extensive orange groves, the oranges, especially those grown in the neighbourhood of Shella, being famous for their quality. The betel, vine, and areca nut are also largely grown on the southern side of the hills and in the low valleys, these plantations being irrigated by elaborate systems of aqueducts. The leaf of the bay-tree (*Tejpyud*) is collected, and is exported to the Sylhet plains. The Syntengs differ from the Khasis, in that they make use of the plough. Both Khasis and Syntengs are industrious cultivators, and they possess a certain rough and ready knowledge of the use of manure. A more detailed description of agriculture in these hills will be given in the monograph.

[1] Khasi and Jaintia Hills Administration Report for 1875-76 by Colonel Evans.

2. *Matriarchal customs and law of inheritance of property.*—The mother is the head of the house, and is both owner and the custodian of the family property as long as she lives. Males can own no property amongst either Khasis or Syntengs except self-acquired property. On the death of the mother, in the case of the Khasis, the family property passes to the youngest daughter. According to some authorities, however, the property would in practice be divided amongst all the surviving daughters. Failing daughters, the property passes to the youngest sister, and failing a sister, to the youngest female cousin. The same

16: McCormack E-4,5 (1956-1958) 1964
[P. 108A] AR7 Khasi AR7

more and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, weds are overturned within the patches and allowed to dry, the weds are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland causes a terracing year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Shillong, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have become gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Shillong country are paddy rice, tea, cassava, cotton, bananas, and pineapples, in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stagmüller 1928.] **Gathering.** Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thirty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few farmers are also seen. Dogs are periodic, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taken to outwit ills. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but contacts initiated in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

17: Banerjee E-5 (1955) 1962 AR? Khasi AR?
Small

796 objects are closed while that of the west (Lyngwan Mawlong) was meant exclusively
796 for sacrificial goats. There is a very big circular courtyard in front of the building where the members of the royal family so also other boys and spectators
[193] hold a ritual dance. The function is always held during the monsoon period of
[643] May or June and the actual dates are fixed in consultation with the Chief priest
[202] (*Sohbiar*) in such a way that the first day—*Pomtiah*[*] always coincides with the market day of Shillong Chow Bazar. The dates of the festival is then communicated to the in-charge of different units of his territory, through a wooden stick '*Kyrwah*' having a few knots of cane-strips, as a form of summons for attending the festival for five days on foot along with subjects under their jurisdiction.

Important Functionary

796 The responsibility of performing this ritual rests on the High-priestess
793 (*Ka Siem Sad*) who is succeeded by her elder daughter. Different ritual ob-
562 jects are procured by her, well in advance and it is obligatory on her part to
[964] join the ceremonial dancing, in which her daughter may also officiate on her
[533] behalf. U Shillong is worshipped by the chief priest while the other ancestors are invoked by lesser priests. The musicians (*Dhakai*) besides their sacred duties, take part in the worship of the ancestors and they are presented with silk turban, jacket, cloth, by the ruling family for the services rendered during the festival. The *Siem* has no special role except to supervise and evoke U Shillong for the welfare of the community. He is required to perform certain sacrifices, failing which his heir-apparent (*Siem Lyngdoh*) does the same. He along with his sister (High priestess) abstain from taking rice during the period of celebration presumably to observe the sanctity of this festival as also to ensure the successful conclusion of the function.

Ritual Methods

796 The festival derives its name from the sacrifice of a large number of goats
792 some of which were supplied from the State fund and from different units of
931 the territory. Formerly at least fifty goats were required and each unit had a specific allotment but owing to the economic difficulty that the Khasi are experiencing, the number of goats sacrificed hardly exceeds twenty-five. The goats collected from the different units are presented to the Chief at the midnight
[271] of the third day. Rice-beer, dried fish, fermented-rice, betel leaves together
[274] with rice are also important ritual objects in this celebration.

Description of the Festival

796 The commencement of the festival was marked by the distribution of dried
792 fish (*iaiei dokha*) to the persons participating in the sacrifice, in the evening of
Pomtiah (*i.e.* 21st June, 1957). This was followed by the dropping of rice-beer by the Chief priest over the five pieces of central hall known as *Ka sakhi shai*

[305] *Up until recently of eight days in Khasi. Calculation the season are according to the phases [illegible] were held in June (July).

20: Hunter C-4 (no date) 1997 AR? Khasi AR?

243 the District, nor do any superior kinds of cereals appear to have been substituted for inferior ones.

THE DIFFERENT STAGES OF RICE CULTIVATION, in English and Khási, are as follow:—The blade as it first shows, *ghá-a-dyle*; the blade when well above the ground, *ka-dyllong-a-dyle*; the ears when first formed, *ion-mat*; the corn beginning to ripen, *ly-ram*; the ripe corn, *ka-ñá*; unhusked rice, *a-dyle*; husked rice, *a-khum*; cooked rice, *ka-ja*.

263 THE VARIOUS SOLID AND LIQUID PREPARATIONS made from rice are the following:—(a) *D'ápin*, cakes of different kinds, sold at six or twelve for a penny, according to size. (b) *D'ahrid or gilt-khi*, prepared by the hillmen as an offering to their deity at the conclusion of the harvest. (c) *Kinlow*, fermented rice water, sold at the rate of four three-farthings to threepence per quart, according to the strength of the liquor. (d) *Ka-kind-phrídlin or ka-kind-ñá-wat*, a kind of spirits distilled from rice, and sold at from threepence to fourpence-halfpenny per quart.

• 279 435

243 OTHER CEREALS.—Indian corn, or *u-ma-ka-ñiu*, is grown on homestead lands. The ground is first manured, and the seed is often sown the middle of April. The crop is fit for cutting in September and October. A kind of millet seed called *u-drú* is commonly sown with paddy on high lands. For want of more suitable land, however, this crop is often cultivated by itself on rocky slopes; and when this course is adopted, the jungle is first cut down in February and burnt. The seed is sown in April, and the crop gathered in December.

244 PULSES AND PEAS.—Only two kinds of pulses are grown in the Hills, *u-ñiu-ka-dieng* and *u-ryn-ka-ñiu*, both of which are varieties of beans. They are sown on high lands in March and April, and 233 gathered in December. The only flax is that made from the pineapple stalk, which is largely used for making natural bags.

246 MISCELLANEOUS CROPS.—(a) *Oranges.*—There are numerous orange plantations in the neighbourhood of Churra Pinji, and the 278 fruit is exported to all parts of Bengal. In the year 1878-79 the estimated exports were 9,400,000 in number, valued at Rs. 93,600, or £9,360, at the rate of Rs. 10 or £1, per thousand. These figures show a decrease in number as compared with the estimated export twenty years ago. The trees flower in March or April, and the fruit ripens in October and the following months. In some cases the oranges are allowed to remain on the trees till March, but

20: Hunter G-4 (no date) 1897 AR? Khasi AR?

439 at the rate of two or three annas for a farthing; and sugar-cane, the cultivation of which is also very limited, at from a little over a farthing
[293] to three farthings per cane. A fermented liquor called *kadaw*, made
• 273 from rice, is sold at from three-farthings to threepence a quart,
435 according to strength; and a distilled spirit called *phaiblin*, or *kalisal-kiwah*, at from threepence to fourpence-halfpenny a quart. This latter description of liquor is sometimes made very strong. Its records exist by which the present prices of the above articles can
[791] be compared with the rates ruling ten years ago. The maximum price of rice during the famine of 1896-97 was 5 *ser* 6 *chhatáks* for the rupee, or about £1 a hundredweight.

804 Measures, Weights, etc.—The Hill people have no proper
805 measurement of time or distance. If there be any standard for measuring distance, it is by the number of *pân* a man chews in the course of a journey, generally about one every half hour. In some parts of the District, land is measured by a stick called *ka dieng-ang*, varying in length from six to seven cubits. Liquids are measured in pounds of different measures, varying from half a *chhatáks* to a *ser*, and also in bamboo tubes. Rice, potatoes, beans, etc. are measured in baskets, varying in size in different markets from two to eighty pounds.

806 In the Khási Hills the inhabitants reckon eight days in the week, named as follows:—(1) Lyndeh; (2) Nongkrem; (3) Umlong; (4) Kongkep; (5) Shillong; (6) Pomrih; (7) Umrih; (8) Yindeh. In the Jaintia Hills the eight days are named thus:—(1) Kylim; (2) Pyrsong; (3) Mâwlong; (4) Mâwsiang; (5) Mâwshai; (6) Pyrkat; (7) Thymtiein; (8) Kotsi. The Khási months of the year, calculated by moons, are as follow:—(1) U Kylla Ipnâw; (2) U Synrong; (3) U Lyhar; (4) U Laiong; (5) U Jaintiang; (6) U Jillew; (7) U Naiwing; (8) U Naitor; (9) U Nailar; (10) U Sypaw; (11) U Naiwang; (12) U Nakynah.

444 Labourers Labourers Classes.—There is, and always has been,
423 a large class of labourers in the District who neither own nor possess any land. Women and children are employed in manual out-door labour of all kinds.

423 Tenures or Land Tenures can hardly be said to exist. There
[427] is nothing whatever resembling the relations between landlord and tenant throughout the Khási Hills. The lands as a rule are either unoccupied property or belong to village communities, and are cultivated under owners but with unwritten agreements. Of the wide

342 down /233/ toward the front in a broad curve, projects here quite a bit beyond the front of the house and covers the stone terrace before the entrance, which is supported by posts, where the occupants customarily sit during the daytime. Firewood is also piled up here at the sides. In the rear the roof ridge is very little--or not at all--curved; the general impression which the house makes through its roof form has been compared with a pig which stands with bowed head before the fodder trough. Generally speaking, the Khasi houses are not very large. I did not see any houses longer than from 6 to 9 meters and with a width of from 3 to 5 meters. However, according to Gordon (p. 30) there are sometimes houses with a length of more than 20 meters. The interior is completely dark. Sometimes a small window at the side--an innovation--or a second side entrance allows some light to filter in. From the roofed terrace one enters first an anteroom which contains at both sides provisions, potatoes, and also wood. A board wall which is closed on top by a wooden grate, where light and air can pass through, separates this anteroom from the main room; upon entering one has to walk up a few steps or climb over a high threshold. 354 In the middle, toward the rear, is the fireplace. If the owner has a distilling license from the 273 British authorities (76) the distilling vessels

76. The restriction through license to counteract a little the consumption of alcohol, exists only in the area of Shillong. Otherwise the brandy production by the Khasi is not regulated.

for the preparation of rice or millet brandy are always kept here. The people have a strong preference for alcohol and especially on bazaar days it is no rarity to see tipsy people. I observed this particularly at the bazaar in Nong-

273 krem. Before I could enter a hut the occupants had to remove a man who was dead drunk. Over
352 the fireplace hangs a rack on which wood is piled up for drying; also food provisions, rice, etc. are kept dry here during the rainy-season. Behind it a rack made of sturdy beams runs straight through the center and sometimes extends along the sides. On it all kinds of household items are kept. In the better houses the best dishes of shiny, polished brass and china are displayed here. This rack also serves as a partition behind which, on the sides and at the rear wall of the house, are the sleeping accommodations.
[352] Considering the very unprepossessing physical appearance of the people, it is surprising how orderly and clean the houses are kept inside.
342 In the principal towns the well-to-do have already adopted the brick building and European comfort. With the Lynngam and the Bhoi, however, we still find the pile dwelling (77). The houses

77. Gordon, ibid., p. 32. There it is mentioned (above) that in some villages of the subdivision of the War pile dwellings are built because the main part of the house rests on firm ground on the mountain side and then extends on piles over the slope. (Cf. the Garo.) The same people still use the bachelor house.

have a length from 10 to 12 meters with a veranda which among the Lynngam is in front, among the Bhoi in the rear of the house. These people
[241] still practise migratory agriculture and therefore move their flimsily constructed houses every two or three years when they change to new fields. It follows that the Khasi house, as described above, represents an advanced construction method. That in earlier days bamboo construction was

headquarters of the Administration. The manufacture of country spirit gives employment to a considerable number of persons, most of whom are females. At a recent census of the country stills in the district, undertaken by the district officials, the number of stills has been found to be 1,520. There must be at least one person employed at each still, so that the number of distillers is probably not less than 2,000, possibly more. The spirit is distilled both for home consumption and for purposes of sale, in some villages almost entirely for sale. In the Jaintia Hills stock-breeding and dealing in cattle provides occupation for 1,295 people, according to the last census. The cattle are reared in the Jaintia Hills and are driven down to the plains when they reach the age of maturity, where they find a ready market amongst the Sylhetis. Cattle are also driven into Shillong for sale from the Jaintia Hills. Another place for rearing cattle is the Siemship of Nongkhlaw, where there is good pasturage in the neighbourhood of Mairang. These cattle are either sold in Shillong or find their way to the Kamrup district by the old Nongkhlaw road. Cattle-breeding is an industry which is capable of expansion in these hills. There are a few carpenters to be found in Shillong and its neighbourhood. The Khasis are said by Col. Waddell to be unacquainted with the art of weaving; but the fact that a considerable weaving industry exists amongst the Khyrwang villages of the Syntengs, and at Mynso and Suhtnga, has been overlooked by him. The Khyrwangs weave a special pattern of cotton and silk cloth, striped red and white. In Mynso and Suhtnga similar cloths are woven, also the sleeveless coat. In former days this industry is said to have been considerable, but it has been displaced to a large extent of late years by Manchester piece goods. The number of weavers returned at the last census in the district was 533. The Khasis and Mikirs of the low country, or Bhois as they are called, weave cotton cloths which they dye with the leaves of a plant called u sola. This is perhaps the wild indigo, or *ram*, of the Shan settlers in the Assam Valley. The weavers are almost always females. An important means of subsistence is road and building work; a considerable number of coolies, both male and female, are employed under Government, practically throughout the year, in

of them, more especially when the latter are situated in places where jungle is dense, and there is fear of attacks from wild animals. In the Lyngngam village is to be seen a high bamboo platform some 20 to 30 ft. from the ground, built in the midst of the village, where the elders sit and gossip in the evening.

All the villages, Khasi, Wite, Lyngngam and Bhoi, swarm with pigs, which run about the villages unchecked. The pigs feed on all kinds of filth, and in addition are fed upon the wort and spent wash of the brewings of country spirit, or *ciou bour*, the latter being carefully collected and poured into wooden troughs. The pigs are of the usual black description seen in India. They thrive greatly in the Khasi villages, and frequently attain extreme obesity.

In the Khasi villages of the high plateaux are often nowadays potato gardens, the latter being carefully protected from the inroads of pigs, calves, and goats by dry dikes surmounted by hedges.

I noticed an interesting custom at a Bhoi village in Nongpoh of barricading the path leading to the village from the forest with bamboo palisading and bamboo *chevaux de frise* to keep out the demon of cholera. In the middle of the barricade there was a wooden door over which was nailed the skull of a monkey which had been sacrificed to this demon, which is, as amongst the Syntengs, called *kkiem*.

FURNITURE AND HOUSEHOLD UTENSILS.

As in the case of houses, so with reference to furniture, the influence of civilization shows many changes. The Khasi of the present day who lives in Mawkhar * has a comfortable house regularly divided up into rooms in the European style with even some European articles of furniture, but owing probably to the influence of the women, he still possesses several of the articles of furniture which are to be met with in the houses of those who still observe the old style of living. Let us take the furniture of the kitchen to begin with. Above the hearth is slung by ropes of cane a swinging wooden framework

* Mawkhar is a suburb of Shillong, the headquarters station.

It will be seen that in the three years following the earthquake of 1897 the exports fell very low indeed. Since 1901 the trade has been steadily recovering, and the exports of 1904 reached half a lakh of maunds.

It will be observed that there has been some improvement, but the *exports* are still not half what they were in 1901-02. There are two kinds of sweet potatoes grown in the district, the Garo potato (*u phaso Kasu*), which appears to have been introduced from the Garo Hills, and *u phaso sendlia*, the latter being distinguished from the Garo potato by its having a red skin, the Garo potato possessing a white skin. These kinds of potato are planted on all classes of land except *lalli*, they do best on *jhumed* and homestead lands. The yam proper (*u phaso shyrwah*) is also largely grown. The small plant with an edible root called by the Khasis *u eilphang* (*Dioscorea sativa Roxb.*), is also largely grown. The roots of the plant after being peeled are eaten raw by the Khasis. *As* far as we know, this esculent is not cultivated in the adjoining hill districts. *Jobi's* tears (*ossie lachymo-Jobi*)* are extensively grown, and are planted frequently with the *eilphang* mentioned above. This cereal forms a substitute for rice amongst the poorer cultivators. Maize or Indian corn (*u ribor hadem*) is grown frequently, thriving best on homestead land, and requires heavy manuring; it is grown in rotation with potatoes. Next in importance to rice comes the millet (*u hwai*), as a staple of food amongst the Khasis. There are three varieties of millets generally to be seen in the Khasi Hills:—*u 'rai-ash* (*setaria Italica*), *u 'rai-shoo* (Panicum sanguinale), and *u 'rai-trub* (Eleusine coracana). *U 'rai-shoo* is cultivated in rotation with the potato, *u 'rai-ash* and *u 'rai-trub* are generally cultivated on *jhumed* land, where they thrive well. Millet is sometimes used instead of rice in the manufacture of spirit by the Khasis; *u rymbai-ja* (*phaseolus calcaratus*), and *u rymbai khang* (*glycine soja*) are beans which are cultivated occasionally. Khasis highly prize the fruit of the plantain, which they give to infants mashed up. The following are the best known varieties:—*Ka hait khán, ka hait rieu, ka hait kulbeit, ka hait bamon, ka hait shyiang.*

* Khasi u ash-rieu.

basket is covered tightly with a cloth so as to be air-tight, and it is allowed to remain in this condition for a couple of days, during which time the liquor has oozed out into the bowl. To make *ka'iad* use the material, the rice or millet from which the *ka'iad kiaw* was brewed, is made use of. It is placed in a large earthen pot and allowed to remain there for about five days to ferment, after which the liquor is strained off. *Ka'iad kiaw* is said to be stronger than *ka'iad ua*. The former is used frequently by distillers of country spirit for mixing with the wort so as to set up fermentation. The people of the high plateaux generally prefer rice spirit, and the Wars of the southern slopes of the Khasi and Jaintia Hills customarily partake of it also. The Khasis of the western hills, e.g. of the Nongstoin Subdivisions, and the Lyngngam, Bhoia, Lalungs, and Hadems almost invariably drink rice-beer, but the Syntengs, like the Khasi splenders, drink rice-spirit. Rice-beer (*ka'iad ua*) is a necessary article for practically all Khasi and Syntengs religious ceremonies of importance, it being the custom for the officiating priest to pour out libations of liquor from a bottle gourd (*u Blangi*) to the gods on these occasions. As there is no Excise in the district, except within a five-mile radius of Shillong, liquor of both the above descriptions can be possessed and sold without restriction.

According to some Khasi traditions, the Khasis in ancient times used not to drink spirits, but confined themselves to rice-beer. It is only in the last couple of generations that the habit of drinking spirits has crept in, according to them. From Khasi accounts, the use of spirits is on the increase, but there is no means of testing these statements. There can be no doubt, however, that at the present time a very large amount of spirit is manufactured and consumed in the district. The spirit is distilled both for home consumption and for purposes of sale; in some villages, e.g. Mawlai and Marbiss, near Shillong, where there are fifty-nine and forty-nine stills respectively, there being a still almost in every house. Mawlai village supplies a great deal of the spirit which is drunk in Shillong, and from Marbiss spirit is carried for sale to various parts of the hills. Other large distilling centres are Cherrapunji, with forty-seven stills; Jowai, with thirty-one stills; Laitkynsew, with fifty-four stills;

1:Gordon E-4, 9 (no date) 1907 ART Khasi ART

274 Nongwar, thirty-one stills; and Bangthang, thirty-seven
933 stills.

From what has been stated above some idea may be gathered
274 how very large the number of stills in the Khasi and Jaintia Hills is. I am not in a position to state with any degree of accuracy what is the amount of spirit manufactured or consumed in the year, but it is very considerable. The out-turn of a Khasi still has been reckoned at from four to eight bottles per day. From this estimate, and the fact that there are 1,530 stills in the district, it may be roughly calculated what is the consumption annually. Practically the whole of the spirit is consumed within the district. The liquor which is manufactured is far stronger than the spirit distilled in the ordinary out-stills in the plains.
273 It has been stated by an expert analyst that the Khasi spirit
935 contains 60 to 80 per cent. of proof spirit, and that it possesses "an exceptionally nice flavour and taste." The usual price at which it is sold is 4 to 6 annas a quart bottle, a second quality being sometimes sold for 3 annas. It will be seen that the
[46,5] liquor is exceedingly cheap. A Khasi in the villages of the interior can get drunk for 2 annas,* or a quarter of an ordinary coolie's daily wage. Drunkenness prevails on every market day at Cherrapunji, Jowai, and other large hats, and on occasions when there are gatherings of the people for various purposes. This cheap but strong spirit is demoralizing the people, and some restriction of its use would be welcomed by
273 many. In the Khasi Welsh Methodist Church abstention from
937 liquor is made a condition of Church membership, but the vast number of stills and the facilities with which liquor can be obtained are a constant source of temptation to the Christian community, and cause many defections.

GAMES.

936 The Khasis have many games, but their principal game is archery, this may be said to be the national game, and is a very popular form of recreation amongst them, the sport being indulged in from about the beginning of January to the end of

* About threepence.

Jr Gordon E-4, 5 (no date) 1907 AR? Khasi AR?

quilt, made out of the bark of a tree, which is beaten out and then carefully woven, several layers of flattened bark being used before the right thickness is attained. This quilt is called by the Lyngngam "Ka-ejilar" (Khasi ka-ejiyal). Food is cooked in earthen pots, but no plates are used, the broad leaves of the surrounding trees taking their place. The leaves are thrown away after use, a fresh supply being required for each meal.

The Lyngngam have one loss, they do not distil spirits; liquor is brewed according to the Khasi method. Games they have none, and there are no social ordinary meetings like those of the Khasis. The Lyngngam methods of hunting are setting spring guns and digging pitfalls for game. The people say that now the Government and the Sirdar of Nongstoin have prohibited both of these methods of destroying game, they no longer employ them. But I came across a pitfall for deer not long ago in the neighbourhood of a village in the Lyngngam country. The people declared it to be a very old one; but this I very much doubt, and I fear that these objectionable methods of hunting are still used. The Lyngngam fish to a small extent with nets, but their idea of fishing *par excellence*, is poisoning the streams, an account of which has already been given in this monograph. The Lyngngam are omnivorous feeders, they may be said to eat everything except dogs, snakes, the hoolock monkey, and lizards. They like rice, when they can get it; for sometimes the out-turn of their fields does not last them more than a few months. They then have to fall back on Jobstears and millet. They eat arum largely, and for vegetables they cook wild plantains and the young shoots of bamboos and cane plants. The Lyngngam are divided up into exogamous clans in the same manner as the Khasis. The clans are exogamous families. The Lyngngam have some stories regarding the founders of these clans, of which the following is a specimen:—"A woman was asleep under a rubber tree in the jungle, a flower from which fell on her, and she conceived and bore a female child who was the ancestress of the Nongrubbar clan." Some of the stories of the origins of other clans do not bear repeating. There do not appear to be any hypergamous groups. As with the Khasis, it is a deadly sin to

20: Number C-6 (no date) 1997 AR? Khasi AR?

[illegible]. In addition, there are a few small buildings at Jowai, in the Jaintia Hills, which have been settled, after encroachment, under the Assam Settlement Rules for a term of ten years. In 1898-99 the total land revenue amounted to Rs. [illegible], or £[illegible], Rs., derived from 14 [illegible]. Other small items of revenue are derived from fisheries, forests, mahals, and excise. In 1898-99 the rate of the fishery mahals was Rs. [illegible], or £[illegible], [illegible]; forests produced Rs. [illegible], or £[illegible], Rs., of which Rs. [illegible] represents fees on the importation of timber from the Khasi States to the District of Sylhet. In the same year mahals yielded Rs. [illegible], or £[illegible], [illegible]; but this total includes the sale of postage and telegraph stamps, as well as the sum realized for revenue stamps. Excise produced Rs. [illegible], or £[illegible], [illegible]. The mahals are sold at the Treasury; there are no licensed vendors. The excise laws are applied only within the limits of the Stations of Shillong and Cherra Punji, and throughout the Jaintia Hills. There are no licensed distillers in the District, and the free manufacture of country spirit is permitted both in the dependent State and in British territory; what is manufactured is mainly for home consumption. In 1898-99 there were in all 18 licenses in force—4 for imported spirituous and fermented liquors, 1 each for middle and shops, 2 for ganjá, and 10 for opium. The Khásis and Syntengs are not addicted to the use of intoxicating drugs, which is confined to the people from the plains residing on British territory.

Courts, etc.—In the year 1833 there were two Magisterial and Civil Courts in the District. By 1850 the number had risen to four, which continues to the present time. The maximum distance of any village from the nearest court is 63 miles, the average distance is 23 miles. In 1833 one European official was permanently stationed in the District; in 1850, two; in 1860 and 1889, again one. In the last-mentioned year the subdivision of Jowai was opened in the Jaintia Hills; and there have since been two officers in the District, a Deputy-Commissioner at Shillong, and an Assistant at Jowai. The total number of magistrates is three. These figures, of course, are exclusive of the staff of the Local Government, which has been established at Shillong since 1874.

Police Statistics.—For police purposes, the Khási and Jaintia Hills are divided into the three following *thánás* or police circles, each two outposts:—(1) Shillong, with an outpost at Nongpoh; (2) Jowai; (3) Cherra Punji, with an outpost at Thárie-ghát, at the foot of the southern hills.

[illegible] and chemical fertilizers. Both level land and terraces are cultivated by the same hand techniques. 241
1 = Silver patches are bordered with walkways between, seeds are overturned within the patches and allowed to dry, the seeds are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or seed with the aid of the typical Khasi hoe. The coldest part of the upland raises a two-crop year, and Khasis often double crop as well. Paddy, the long been found in the lowlands, in parts of Jaintia and Khasi, the only places where the plow is found. Nowadays paddy is 243 189 178
sown and more sown in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have home gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Khasi country are paddy rice, tea, cassava, cotton, bananas, and pineapples, in War, they are betel nut, jute leaf, oranges, and sugar cane. Fishing and hunting. Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stoughton 1935.] Gathering. Khasis once gathered about 100 species of wild plants, most of them for food, but some for medicine. Thirty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. Domestic animals. Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but nowadays receive prepared food. Cattle and goats [illegible] herds in the hills during the winter, but are herded by a communally hired herdsman during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are periodic, except for hunting dogs. Cats are popular. Food and stimulants. The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Blue country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

which are not found usually in the people of India. Both not slave manual labour, and even the Khasi clerk in the Government offices is quite ready to take his turn at the hoe in his potato garden. The men make excellent stonemasons and carpenters, and are ready to learn fancy carpentry and mechanical work. They are inveterate chewers of *supari* and the pan leaf (when they can get the latter), both men, women, and children; distances in the interior being often measured by the number of betel-nuts that are usually chewed on a journey. They are not addicted usually to the use of opium or other intoxicating drugs. They are, however, hard drinkers, and consume large quantities of spirit distilled from rice or millet. Rice beer is also manufactured; this is used not only as a beverage, but also for ceremonial purposes. Spirit drinking is confined more to the inhabitants of the high plateaux and to the people of the War country, the Bhoie and Lyngngam being content to partake of rice beer. The Mikiro who inhabit what is known as the "Bhoi" country, lying to the north of the district, consume a good deal of opium, but it must be remembered that they reside in a malarious *terai* country, and that the use of opium, or some other prophylactic, is probably beneficial as a preventive of fever. The Khasis, like other people of Indo-Chinese origin, are much addicted to gambling. The people, and especially those who inhabit the War country, are fond of litigation. Col. Rivar remarks, "As regards truthfulness the people do not excel, for they rarely speak the truth unless to suit their own interests." Col. Rivar might have confined this observation to the people who live in the larger centres of population, or who have been much in contact with the denizens of the plains. The inhabitants of the far interior are, as a rule, simple and straightforward people, and are quite as truthful and honest as peasants one meets in other countries. My impression is that the Khasis are not less truthful certainly than other Indian communities. McCosh, writing in 1837, speaks well of the Khasis. The following is his opinion of them:—"They are a powerful, athletic race of men, rather below the middle size, with a manliness of gait and demeanour. They are fond of their mountains, and look down with contempt upon the degenerate race of the

[the Khasi --- Angl/1]

SECTION IV.

RELIGION.

GENERAL CHARACTER OF POPULAR BELIEFS.

THE Khasis have a vague belief in a God the Creator, U *Blei Kingthaw*, although this deity, owing, no doubt, to the influence of the metriarchate, is frequently given the attribute of the feminine gender, *ei*, *Ka lei Syngkar*. The Khasis cannot, however, be said to worship the Supreme God, although it is true that they sometimes invoke him when suffering and in times of trouble. The religion of the Khasis may be described as animism or spirit-worship, or rather, the propitiation of spirits both good and evil on certain occasions, principally in times of trouble. The propitiation of these spirits is carried out either by priests (*lyngdoh*), or by old men well versed in the arts of necromancy, and as the *lyngdoh* or wise man deals with good as well as evil spirits, and, as often as not, with the good spirits of ancestors, the propitiation of these spirits may be said to partake of the nature of Shamanism. A very prominent feature of the Khasi beliefs is the propitiation of ancestors; but this will be described separately. There is a vague belief amongst the Khasi of a future state. It is believed that the spirits of the dead, whose funeral ceremonies have been duly performed, go to the heaven or garden of God, where there are groves of betel-nut trees; hence the expression for the departed, *uba ban kwai ha iing u blei* (he who is eating betel-nut in God's house), the idea of supreme happiness to the Khasi being to eat betel-nut uninterruptedly. The spirits of those whose funeral ceremonies have not been duly performed are believed to take the forms of animals, birds, or

P. 105

of the Khasi.

Just as the Khasi are unable to explain how man fell into sin, so they also cannot explain why the rooster appears as mediator between god and man. The Khasi tradition relates of the rooster: u khun ka blei uba kit ryndang ba shah ryndang na ka bynta jong ngs u briu, i.e. he who, as son of the goddess, gives his life for man, thus expiating sin through sacrifice and reconciling god.

The Khasi believe in another world and their attention is directed towards the comfort of the spirits of the dead. One of the main tasks is to give them nourishment (ai ban), which must be done, since the welfare of the living depends on the welfare of the dead. For example, if one can no longer get the corpse of the deceased because it is in a foreign country or has been consumed by wild animals, one takes his clothes at the very least and carries out the burial ceremonies with these. For only such spirits, whose burial ceremonies were performed according to usage and custom, can participate in chewing betel nuts in the garden (in the house) of god, whereas the others must wander around on earth [209] or must continue living in insects, birds, and other animals. They do not believe in hell (in the Christian sense). The greatest felicity [27K] for a Khasi is "to chew betel nuts perpetually." Therefore they conceive of heaven as the dwelling (garden or house) of god, in which only betel nuts are chewed: uba bam kwai ha iing u blei (he who chews betel nuts in the house of god).

[716] This cult of spirits, which relates to deceased relatives, is mixed with the ancestor cult. Thus the first great-grandmother of each sib (jaid) becomes a goddess (ka jaubei) and the first great-grandfather of the sib a god (u thaulang).

773 gold and silver, of gilded beads alternating
772 with real beads of coral. The women and girls also take some light refreshments along. They take care of the necessary pauses for quais (betel nuts) and smoking, for the Khasi are never in a hurry. Several coolies, who accompany the procession, carry the necessary utensils for the sacrifices on their backs in waterproof woven baskets (ka shang) with forehead straps (u star) woven of bamboo, while other coolies lead the living animals to be sacrificed: a goat and a rooster.

When everything is ready, a little band, consisting usually of only a flute player (ka 'tangmuri) and one or two drummers (ksing), begins to play and the procession moves up the mountain dancing. It proceeds slowly. From time
774] to time everybody rests and the coconut pipe (ka jingdih duma) is passed from mouth to mouth. After a bite of betel nut (quai) has been taken, the procession moves on again dancing until the top of the mountain is reached. The Khasi must be known and admired because of the quietness and cheerfulness with which they do everything. There is no hurrying and haste, no rushing back and forth and no forgetting of anything. They give themselves time for everything and therefore succeed in what they attempt.

Hopping, mincing, and skipping they reach the top. If there are Khasi oaks there, the ones who have arrived break off leaves from them and strew them on the ground. Otherwise the Khasi oak leaves are brought along from home so that they can be strewn on the ground on the top of the mountain. This makes the ground holy and consecrated to the spirits. The men now put aside the swords and the dancing brush. They begin to prepare the first ceremonial sacrifice

942 laden themselves with more than 60 to 65 pounds.

944 Many Khasi have to start during the afternoon because of the great distance to the market. They spend the night with acquaintances. In the dark [?] they march by torch light. The torches consist of several igre, i.e., very thin bamboo tube, saturated with petroleum and lighted. Or a large bamboo tube is filled with cloth that has been saturated in petroleum. The burning torches are swung in circles while the Khasi march so that only a glow is provided, but this prevents the torches from going out. The glow is quite sufficient for giving enough light for the road (foot path).

•[296] Betel nuts are chewed (4) all the way and

4. The length of the road is also measured in "betel nuts."

water pipes are smoked during the rests.

943 b) The Market Place. It is not possible
361 to talk about a definite place where the Khasi usually hold the market. This varies considerably according to the region. First of all the place chosen for the market lies outside the village. By preference they hold their markets on high ground or some such safe place. A place that has once been chosen remains the
[718] market place for that particular village. The market place is often found very close to the memorial stones, just as if the spirits of the ancestors honored there should offer aid and protection to the visitors to the market. On the southern slopes of the Khasi Mountains the market is often held on the bank of a river, for the reason that the Khasi come to these markets in boats. The market place in Mawkhlein is quite isolated. Also the one in

JOURNAL

OF THE

ASIATIC SOCIETY OF BENGAL.

Vol. LXXIII. Part III.—ANTHROPOLOGY AND COGNATE SUBJECTS.

No. 4.—1904.

101 *Note on the Khasis, Syntengs, and allied Tribes, inhabiting the Khasi and Jaintia Hills District in Assam.*—By MAJOR P. R. T. GURDON, *Superintendent of Ethnography in Assam.* (With plates III—IV).

[Read 3rd August, 1904.]

142 1. *Physical characteristics.*—The men are seldom tall; they are generally well made, and possess great strength of limb,—of leg in particular. Their features show a resemblance to those of the Japanese; their complexions are fair, noses flat, lips thick, and eyes very frequently obliquely set. The women are good-looking, of a Burman type, and are cheerful and pleasant-mannered. Children are sometimes exceedingly pretty. Khasis are inveterate chewers of *pân*,—both men, women, and children; the distances from place to place being measured by the number of betel-nuts that can be chewed on the journey. The hair of the males is shaved above the forehead pretty high up, and the remainder is gathered into a knot at the back of the head. Very few Khasis have much hair about the face. Both Khasis and Syntengs wear the sleeveless coat (*jymphong*) loin-cloth, *jain sieng* (a kind of

[276] [405] [302]

291

[illegible] and chemical fertilizers. Both local land and 241
[illegible] are cultivated by the same hand techniques.
[illegible] Khasi patches are fashioned with walkways between, [illegible] are overlayered within the patches and allowed to dry. The [illegible] are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or [illegible] with the soil of the typical Khasi hoe. The outlying part of the upland [illegible] a swinging [illegible] and Khasis often [illegible] 243
[illegible] as well. Paddy has long been found in the 180
lowlands, in parts of Jaintia and Khasi, the only 178
places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Upland Khasis have home gardens in which they 244
raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplants, and many others. Important crops in Khasi commons are paddy rice, tea, sugarcane, cotton, bananas and 181
pineapples, in Nor. they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by processing streams, but this is a subsistence activity only in the southern lowlands. Shooting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [illegible] **Gathering.** Khasis once gathered about 100 species of wild plants, most of them for food, but some for medicine. Twelve villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants [278]
continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is 231
now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats range [2.34]
freely in the hills during the winter, but are herded [2.35]
by a communally hired herdsman during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few [2.36]
horses are also seen. Dogs are partials, except for hunting dogs. Cats are popular. **Food and stimulants.** 262
The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the
means of most. Meals are taken twice a day, in the 264
morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods 262
are taboo to certain sibs. Stimulants are extremely 189
common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also 276
smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, 275
where distilled rice whisky is cooked and sold by the 275
glass and by the bottle. Imported opium had spread widely in the midcentury Khasi country, but controls 276
instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and 177

children, but Christian influence has modified or drove underground the consumption by women and children. Industrial arts. The only industrial arts traditionally practiced in all households were a rude weaver; carpentry and a simple utilitarian basketry. Other arts were few, and were practiced in village specialties: the washing and smelting of iron ore and the forging of bows, darts, knives, swords, and cooking pots (upland Khasi); the spinning of cotton thread (Nongpoh village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintia, Khasi, Lyngngam, War); the spinning and weaving of Eri silk (Khyrwang and Sohpetang villages, Khasi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Lawai village, Jaintia). Handweaving and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved, by innovation of major importance in the sawing and tailoring, on sewing machines, of ready-made garments for both sexes. [J.F. Dunrah 1968; C. W. 1932.] Trade. Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market attendance for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small rural markets of least some local farm produce, plus other essentials like betel nut, and the betel and tea stalls, which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, constabar, the wood of the sal tree, Eri silk thread, limestone, coal, iron, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, oil, turmeric, and chillies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stoppelaar 1924a.] Division of labor. Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

17: Banerjee E-5 (1955) 1962 AR7 Khasi AR7
Smit

796 objects are stored while that of the west (kyncam blang) was meant exclusively
796 for sacrificial goats. There is a very big circular courtyard in front of the building where the members of the royal family as also other boys and spinsters
[793] hold a ritual dance. The function is always held during the moonlit period of
[443] May or June and the actual dates are fixed in consultation with the Chief priest (*Sokhlei*) in such a way that the first day—*Pamtiah** always coincides with the
[202] market day of Shillong Chota Bazar. The dates of the festival is then communicated to the in-charge of different units of his territory, through a wooden stick '*Kyrwah*' having a few knots of cane-strips, as a form of summons for attending the festival for five days at Smit along with subjects under their jurisdiction.

IMPORTANT PARTICIPANT

796 The responsibility of performing this ritual rests on the High-priestess
795 (*Ka Siem Sad*) who is succeeded by her eldest daughter. Different ritual objects are procured by her, well in advance and it is obligatory on her part to
562 join the ceremonial dancing, in which her daughter may also officiate on her
[764] behalf. U Shillong is worshipped by the chief priest while the other ancestors
[533] are invoked by lesser priests. The musicians (*Dhalia*) besides their normal duties, take part in the worship of the ancestors and they are presented with silk turban, jacket, cloth, by the ruling family for the services rendered during the festival. The *Siem* has no especial role except to supervise and evoke U Shillong for the welfare of the community. He is required to perform certain sacrifices, failing which his heir-apparent (*Siem kynnah*) does the same. He along with his sister (High priestess) abstain from taking rice during the period of celebration presumably to observe the sanctity of this festival as also to ensure the successful conclusion of the function.

RITUAL MATERIALS

796 The festival derives its name from the sacrifice of a large number of goats
782 some of which were supplied from the State fund and from different units of the territory. Formerly at least fifty goats were required and each unit had
831 a specific allotment but owing to the economic difficulty that the Khasi are experiencing, the number of goats sacrificed hardly exceeds twenty-five. The goats collected from the different units, are presented to the Chief at the midnight
[273] of the third day. Rice-beer, dried fish, fermented-rice, betel leaves together
[276] with nuts are also important ritual objects in this celebration.

DESCRIPTION OF THE FESTIVAL

796 The commencement of the festival was marked by the distribution of dried
782 fish (*tuit dokha*) to the persons assembled on the occasion, in the evening of *Pamtiah* (*i.e.* 21st June, 1957). This was followed by the dropping of rice-beer by the Chief priest over the few pieces of central hall known as *Ka mih-ka shor*

[905] *A week consists of eight days in Khasi. Calendar the names are according to the places where markets are held in Khasi Hills.

	Name	Market
1.	Pamtiah	Shillong Chota Bazar.
2.	Umiar	Cherrapunji.
3.	Tim-dab	Shillong Bara Bazar.
4.	Lynglu	Sumpnut.
5.	Tongkrem	Songhrem.
6.	Mawlong	Laban (Shillong).
7.	Synghar	Cherrapunji Chota Bazar.
8.	Shillong	Laitkyrh Sub.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

428 to the sisters of his wife, or to her nearest relatives if there are no sisters. The rank and titles of a deceased male descend to his brother; when no brother exists, then to the male children of his mother's sisters (maternal aunts); should the maternal aunts have no male children living at the time, then to the eldest male child of his sisters. When no relatives are to be found, the property of the deceased goes to the ruler of the country; or if a man dies leaving no relative other than wife and children, *i.e.* no relatives on the mother's side, the property in this case also goes to the ruler, who, as the wife and children cannot preserve the ashes of the deceased, takes charge of them, and for so doing takes all the property also. With regard to the inhabitants of the Lower Hills at Shellá, the custom as to succession is as follows:—Property belonging to a subject of Shellá is divided into two classes—(1) Property inherited from ancestors, which descends to the nearest of kin or to the relative of a deceased person who can perform his obsequies. (2) Property acquired during the lifetime of the holder, which is inherited by the children, whose duty it is to provide for the maintenance of their mother until she re-marries or dies.'

434 465 MATERIAL CONDITION OF THE PEOPLE.—The Khásás and the Syntengs are as a people prosperous. Common labourers, if adult males, can earn wages as high as one shilling per diem, and adult females as high as eighteenpence. The dwellings of the well-to-do 342 classes are generally constructed of masonry, with thatched roof and plank floor, and divided into two or three rooms. The furniture 352 consists of a bedstead (*charpái*), a mat or two (*mawf*), some cooking utensils, and a few boxes. The ordinary peasants and poorer 342 classes construct their huts of stone, mud, or plank walls, with a 184 thatch or cane roof. These are fitted with wooden platforms or loose planks placed on the ground to serve as beds. The food 262 of the well-to-do classes consists of rice, fish when obtainable, fowl 434 or meat, curry, vegetables, oil, hog's lard, fermented and spirituous liquor. It may be estimated that the living expenses of an average-sized household of this class would be about Rs. 25 or £2, 10s. a month, valuing the articles of consumption at *bázár* prices. An ordinary husbandman or labourer lives on rice, dry fish, occasionally a 276 little meat, oil, or hog's lard. *Pán* leaf, betel-nut, and lime are essential to the comfort of all the hill people, who are inveterate chewers of *pán*. They commence at an early age, and are rarely seen without a *pán* leaf in their mouths; the females are quite

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

disfigured from the practice. Adults will chew as many as four or five betel-nuts a day, with the usual accompaniment of *pân* leaves. The estimated cost of maintaining an average family of the labouring class is about Rs. 8 or 16s. a month. 276 [434]

TOWNS: SHILLONG.—There are no towns in the usual acceptance of the word; but the chief places in the Hills, looked upon by the inhabitants as cities, are Shillong, Jowâi, Cherrâ Pûnji, and Shellâ. According to the Census of 1872, Shillong had only 1363 inhabitants, Cherrâ Pûnji 443, and Jowâi 4502. Jowâi, however, is a collection of rural hamlets, and the population of Shillong has entirely altered since the date of the Census. The latter place first became the Civil Station in 1864, in substitution for Cherrâ Pûnji; and when Assam was erected into an independent Province in 1874, it was selected as the permanent seat of the Local Government. The Chief-Commissioner resides there, and also the heads of all departments in the Administration. The area of the Station is 7 miles in length by 1½ to 1¾ miles in breadth. A considerable native population is already settled, and is increasing from day to day. One of the largest weekly markets is held in the *bâzâr*; and with a view to facilitate access to the Station, which is the sanitarium for the Province of Assam, a cart road has recently been completed to Gauhâti on the Brahmaputra, which will tend to make the place more and more important. An excellent water supply is introduced into Shillong through an aqueduct which has its source in the neighbouring hill streams, and sanitary measures are carefully enforced. Large sums of money have annually been expended on the erection of the public buildings necessary for the offices of the administration. A printing-press has been established, from which issue all the official documents and reports of the Province. The climate is excellent, the temperature being more equable than that of any other hill station in India, and therefore admirably suited to the constitution of Europeans. There is a church at Shillong, and a chaplain on the Bengal establishment officiates both there and at Gauhâti. The cantonments were occupied in 1875 by the 43d Regiment of Assam Light Infantry, with three outposts. The strength was 9 European officers, 16 native commissioned officers, 80 non-commissioned officers, 772 fighting men, and 58 paid camp followers and non-combatants; grand total, 935. The total cost, including contingencies, was Rs. 189,190, or £18,919.

632 632 648 [443] [743] [491] [365] [364] [344] [213] [132] [346] [712]

estates. In addition, there are a few small holdings at Jowái, in the Jáintia Hills, which have been settled, after measurement, under the Assam Settlement Rules for a term of ten years. In 1876-77 the total land revenue amounted to Rs. 223, or £22, 6s., derived from 24 estates. Other small items of revenue are derived from fisheries, forests, stamps, and excise. In 1876-77 the rent of the fishery *mahál* was Rs. 3321, or £332, 2s.; forests produced Rs. 773, or £77, 6s., of which Rs. 652 represents fees on the exportation of timber from the Khási States to the District of Kámrúp. In the same year stamps yielded Rs. 16,121, or £1612, 2s.; but this total includes the sale of postage and telegraph stamps, as well as the sum credited for service stamps. Excise produced Rs. 1216, or £121, 12s. The stamps are sold at the Treasury; there are no licensed vendors. The excise laws are applied only within the limits of the Stations of Shillong and Cherrá Púnjí, and throughout the Jáintiá Hills. There are no licensed distilleries in the District, and the free manufacture of country spirit is permitted both in the dependent States and in British territory; what is manufactured is mainly for home consumption. In 1876-77 there were in all 18 licenses in force—4 for imported spirituous and fermented liquors, 1 each for *mahút* and *chandu*, 2 for *gánjá*, and 10 for opium. The Khásiás and Syntengs are not addicted to the use of intoxicating drugs, which is confined to the people from the plains residing on British territory.

648
651
648
655
[274]
276

Courts, etc.—In the year 1835 there were two Magisterial and Civil Courts in the District. By 1850 the number had risen to four, which continues to the present time. The maximum distance of any village from the nearest court is 65 miles, the average distance is 25 miles. In 1835 one European official was permanently stationed in the District; in 1850, two; in 1862 and 1869, again one. In the last-mentioned year the subdivision of Jowái was opened in the Jáintiá Hills; and there have since been two officers in the District, a Deputy-Commissioner at Shillong, and an Assistant at Jowái. The total number of magistrates is three. These figures, of course, are exclusive of the staff of the Local Government, which has been established at Shillong since 1874.

692

Police Statistics.—For police purposes, the Khási and Jáintiá Hills are divided into the three following *thánás* or police circles, with two outposts:—(1) Shillong, with an outpost at Nongpoh; (2) Jowái; (3) Cherrá Púnjí, with an outpost at Thária-ghát, at the foot of the southern hills.

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

on a historical past, different from that of the Khasi proper, the former having been ruled by the powerful, but somewhat Hinduised dynasty of the Jaintia Rajas until the Jaintia Wars of the British; the latter by small independent chiefs. Yet Jaintia social organization appears on the whole to preserve the matrilineal social structure clearer and to be less influenced by plains-acculturation, than that of the Khasi, though a few features of Brahmanical religious observances and also some traces of racial admixture are found in the immediate vicinity of Jowei, the former summer residence of the Jaintia Rajas. Stronger no doubt, than this influence, was that exercised by the British and non-Assamese Indians in the provincial capital Shillong since 1866. Methods of agriculture and other aspects of material civilization differ but little in the Jaintia- and Khasi plateau-areas. 101 175 611 184 177 144 177 241 184

The same cannot be said of both: the Wár-Khasi and Wár-Jaintias. Linguistically their affiliations are with the Khasi or Jaintias respectively, in the plateau-areas. Economically, however, both Wár-groups form a separate pan-leaf cultivating unit in the little accessible steep southern slopes of the Khasi- and Jaintia Hill massif. Both Wár-groups live in the environment of luscious tropical flora and fauna, sharply differentiated from the cool, barren plateau with its perennial winds and the heroic, if solitary beauty of its highland heaths, which forms the background of both the Khasi- and Jaintia plateau-groups. 101 [197] [131] [13]

The age of the Wár-Khasi and -Jaintias, as one independent economic, — and two half-independent dialectical linguistic entities, is an intricate problem. The two Wár-groups subsist on pan-leaf cultivation as a money crop, grown in the thick tree-gardens as creepers; not on food-cultivation, as do the plateau-groups, because there is insufficient space on the steep slopes, for vegetable gardens or -fields. The pan-leaf cultivators therefore depend on food, purchased from outside. The slopes seem to have been uninhabited until not long ago. Yet pan-leaf chewing is such an integral part of Khasi life, that until quite recently, and occasionally even now, a distance between two places is not measured by the number of hours used for walking, but by the number of betelnut- and pan-leaf packages, consumed on the way. Also the common benediction among Khasi expresses the wish that so and so may eat pan in the Garden of God. Yet pan-cultivation and the settlements of the Wár-people as pan-leaf cultivators in the southern slopes seem comparatively young. Pan-cultivation on the plateau is impracticable. It is therefore possible that pan was for a long time only a much valued import article from the plains, bartered against Khasi ore and iron tools, though it is now an export article from the Wár-country, brought to the markets of the plains, by both Wár-Khasi and Wár-Jaintia women and men. 174 249 433 184 [438] [484] [276] [576]

According to a tradition, across which I came among the Nonglamin clan of the Nongmuker village, the ancestors of the present Wár people were on the plateau at a time when no pan-cultivation was going on in the slopes and none of the present big estates of pan-tree gardens was yet held by their present (Wár-) owners. A not distant ancestor of a Nonglamin clan-member who about two or three generations ago told the story to U Siang (one of 249 173 [115]

nure and chemical fertilizers. Both level land and hillsides are cultivated by the same hand techniques: 3 × 6-foot patches are fashioned with walkways between, sods are overturned within the patches and allowed to dry, the sods are burned slowly and the ashes spread over the soil, and finally the seed is sown, either broadcast or sunk with the aid of the typical Khasi hoe. The coldest part of the upland enjoys a two-crop year, and Khasis often double crop as well. Paddy has long been found in the lowlands, in parts of Jaintia and Bhoi, the only places where the plow is found. Nowadays paddy is more and more seen in the uplands, together with a simple terracing and irrigation technology. Many upland Khasis have house gardens in which they raise a wide variety of vegetables, including pumpkins, cabbage, radishes, sweet potatoes, eggplant, and many others. Important crops in Bhoi country are paddy rice, lac, caoutchouc, cotton, bananas, and pineapples; in War, they are betel nut, pan leaf, oranges, and sugar cane. **Fishing and hunting.** Fishing is done by poisoning streams, but this is a subsistence activity only in the southern foothills. Hunting was formerly by bow and arrow or by traps, including spring guns and pitfalls, but was always primarily a sport. [Cf. Stegmiller 1925.] **Gathering.** Khasis once gathered about 150 species of wild plants, most of them for food, but some for medicine. Thrifty villagers still gather food plants, but there is no real dependence on gathering. Medicinal plants continue to be very important. **Domestic animals.** Fowl, goats, pigs, and cattle are bred both for meat and sacrifice. Milk was formerly not utilized, but is now so popular that specialists keep herds of milch cows. Pigs are used as village scavengers, but some also receive prepared food. Cattle and goats forage freely in the fields during the winter, but are herded by a communally hired herdsboy during the agricultural season. Most households keep chickens, primarily for their eggs, and a few keep ducks. A few horses are also seen. Dogs are pariahs, except for hunting dogs. Cats are popular. **Food and stimulants.** The staple food of Khasis is boiled rice, together with the dried fish which is imported from Sylhet. Boiled beef, pork, and chicken are relished, but beyond the means of most. Meals are taken twice a day, in the morning and evening, although farmers also take a midday meal in the field, and others may take tea and cold sweet potatoes or rice bread. Certain foods are taboo to certain sibs. Stimulants are extremely common, especially betel nut, which is often accompanied by a bit of tobacco. Tobacco is also smoked as cigarettes and in hookah and other pipes. Every village has one or more household taverns, where distilled rice whisky is cooked and sold by the glass and by the bottle. Imported opium had spread widely in the malarious Bhoi country, but controls instituted in the 1940s have been fairly successful. All stimulants were once taken by men, women, and

312

surface soil of the hills upon which the houses are built.' Cholera is attributed to importation from the plains. 364

SANITATION.—It has already been stated that the ordinary Khási villages are absolutely destitute of any conservancy arrangements. The sanitary condition, however, of the Station of Shillong is described as 'good.' The natural drainage is excellent. Drinking water is obtained chiefly from hill streams, and on the banks of these streams conservancy regulations are enforced. The water is conducted into the town by means of an artificial water-course. Public latrines have been erected at suitable places inside the town. The staff of sweepers and *beldárs* keeps the roads and drains clean, and the surface generally free from pollution. The sanitary condition of the cantonment is reported to be very good. [164]

CHARITABLE DISPENSARY.—There is one dispensary in the Khási and Jáintiá Hills—at the Station of Shillong. It was first opened in 1872, and considerable additions have since been made to the building. During 1874 a total sum of Rs. 775. 8, or £77, 11s., was expended on new constructions and repairs, towards which the European residents subscribed Rs. 329. There is now accommodation for 10 male and 3 female patients. In that year the total number of in-door patients treated was 44, of whom 9 died, giving a death-rate of 20·45 per cent. The number of out-door patients was 529, or an average daily attendance of 7·8. Of the grand total of patients of both classes, only 31 were females. The largest number of cases are classified under the headings of fevers and constipation and colic. The total income during the year was Rs. 1598. 13. 9, or £159, 17s. 8d., of which Government contributed Rs. 300 for salaries, and an additional Rs. 300 as a special allowance. The European subscriptions amounted to Rs. 869, as compared with Rs. 33 subscribed by natives. The total expenditure was Rs. 1187. 15. 6, or £118, 16s., leaving a balance in hand of Rs. 410. 14. 3. The chief items were Rs. 480 for salaries of medical subordinates, Rs. 160 for servants' wages, and Rs. 222 for dieting of sick. There were 53 minor operations performed during the year. 743 [164]

The people of the District have no system of medicine of their own, and no native practitioners. Their sole remedies consist in divination and incantation. The only indigenous native drugs are chireta and wormwood. As stated in a previous paragraph, a small cinchona plantation was established by Government at Nongklao in 1867. 755 278 648 654

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

at Rs. 480,000, or £48,000, and the revenue derived by Government from the quarries was Rs. 67,266, or £6726. In addition, the Khási Chiefs receive a revenue from this source of more than £2000. 648 651 317

IRON.—The smelting of iron was once the chief industry in the Khási Hills, and a considerable quantity of the metal used to be exported into Sylhet, both in the crude and the manufactured state. Recently, however, this industry has almost died out, in the face of the competition of the superior article imported from England and sold in the plains at a cheaper rate. The indigenous methods of extracting, washing, and smelting the ore have been minutely described by Professor Oldham. The following description is taken from Mr. Allen's Report, dated 1858, at which date the annual export of smelted iron was estimated at 45,000 *maunds*, valued at Rs. 67,500, or £6750, at the rate of Rs. 1. 8 per *maund*: —'The ore is said to be most abundant and of the best quality in the State of Khrim, especially at the villages of Nongkrím and Noyandri. A few iron articles, such as *dáos* or hill knives, *koddlis* or mattocks, spear and arrow-heads, are manufactured by the Khási smiths in the Hills; but the greater bulk of the smelted iron is sent to the plains for sale in circular lumps weighing about 4 or 5 *sers*. These lumps, called *birá*, sell at Chhaták for from Rs. 1. 4 to Rs. 1. 6 per *maund*. The best iron, however, which is beaten into bars called *peti*, sells for from Rs. 1. 10 to Rs. 1. 12 per *maund*. Khási iron is preferred to English, in consequence of its greater malleability. It is much used by the native boat-builders of Sylhet and the neighbouring Districts to make fastenings for the timbers of their boats. When brought into the market, it is more than half dross, and it is this circumstance which renders the iron trade unprofitable. The cost of carriage from the Hills to the plains is about 6 *dannás* per *maund*; and the traders, who are all Khásiás themselves, affirm that they get an average profit of only 2 *dannás* per *maund*.' The tables of trade for 1876-77 return no smelted iron as exported from the Hills, but Rs. 7000 of iron implements exported, against nails and ironmongery imported to the value of Rs. 18,000. 178 325 439 [326] [435] [501]

THE MANUFACTURES of the District, besides iron, consist of coarse cotton and *randia* cloth, plain silver work, rude implements of husbandry, netted bags made of the fibre of the pine-apple, common pottery, and mats and baskets. With the exception of the 28 433

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

COTTON CLOTHS.

283 In the Jaintia Hills at Mynso cotton is spun into thread, and
288 weaving is carried on there, but on a limited scale. The Mynso people weave the small strips of cloth worn by the men to serve the purpose of the Assamese *lengti* or Hindi *languti*. In Suhtnga the people import cotton thread from Mynso and weave the (*ingki*) or sleeveless coat, peculiar to the district; these coats are dyed red and blue. The dark blue or black dye
824 is obtained from the leaf of a plant called *u sybu*, which
386 Mr. Rita has classified as *strobilanthus hoeditolius*, which
288 grows in the gardens round the homesteads. The leaves are dried, then reduced to powder, mixed with hot water, and the skeins of thread are steeped in the liquid. The colour is permanent. The red dye is obtained from the mixture of the dry bark of two shrubs, *ka lapyndong* (*symplocos racemosa*, Roxb.), and *ka 'larnong* (*morinda-tinctoria*, Roxb.), the latter being the same as the Assamese (আচুকাঠ) *áchukáth*. The bark is dried, then pounded, and the two sorts are mixed together and made into a paste with hot water. The skeins are steeped in this mixture for twenty-four hours, then taken out and divided, and again steeped for another twenty-four hours. The Lalungs and Bhois and Lynngams all weave cotton cloths, which are generally dyed blue, sometimes striped blue and red. The Wárs weave cotton cloths which are dyed red and yellow, the cloths being woven in checks. Mr. Darrah remarks that the cotton grown in the Jaintia Hills is said to be the best cotton produced in the province. Its thread can be more closely woven than that of other kinds. This statement, however, is not borne out by Mr. Allen writing in 1858, who says that the cotton is of inferior quality, the staple being short and woolly. The cotton cloths woven by the Bhois are called *spua*.

POTTERY.

[162] The Census Report of 1901 gave the number of persons who
323 are supported by the manufacture of pottery at 54 only. Pottery is manufactured at one place only in the Jaintia Hills,

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

211 which a figure, evidently of a Hindu god, has been carved, without
171 doubt after the erection of the stone. Here we have a striking parallel case to the painted and carved menhir near Tregastel in Brittany, upon which has been carved the representation of a crucifix. There are also some carved stones near Nartiang (said to represent two women) called *mawthawdur briew*.

211 The Khasis say that these great stones were brought sometimes from considerable distances. After being hewn,
483 the stones were laid on a large, wooden trolley and dragged
283 across country by means of ropes of cane, of which plenty can be had from the War country on the southern side of the district, and then placed in position by means of ropes and levers. It seems little short of marvellous that these stones, which sometimes weighed many tons, were placed in position by such primitive means, especially when we consider the great trouble there was to re-erect one of the fallen stones at Stonehenge lately. Nowadays only comparatively small stones are erected, which are generally hewn and erected on the spot, so that there is no necessity for any conveyance.

000 In conclusion, it may be remarked that the subject of the Khasi monoliths is in reality a large one, on which a great deal could be written, but owing to considerations of space it has been found necessary to compress the account within its present limits.

FESTIVITIES, DOMESTIC AND TRIBAL.

535 Dancing forms the principal part of all the Khasi festivities,
776 and is an important adjunct of some of their religious
796 ceremonies. One of the greatest festivals in the Khasi Hills is
789 the Nongkrem dance; it may be said to be as important an event to the Khasis as the *Beh dieng-khlam* festivities are to
782 the Syntengs.

The Nongkrem dance is really part of what is known as the *pom-blang*, or goat-killing ceremony, performed by the Siem of Khyrim (or Nongkrem) with the aid of his *soh-blei* (high priest) and the various *lyngdohs* (or priests) to Ka Blei Synshar (the ruling goddess), that the crops may prosper and that there may

411
•283

For making the string (u ksai) the Khasi split a bamboo and split a strip of it off which they smoke thoroughly. The string is uniform for bows with a circular notch; for bows with tapered points, it becomes thicker towards the ends, on which braces are cut from the bamboo knots made from one piece with the string. The kinds of bamboo used for the strings are called u spit, u skhen and u siej-lieh by the Khasi. Bast string, twisted many times, is also used for the string. The bamboo strings are smoked (see above).[1] The strings obtained thus are extremely strong and can stand great tension. With a bow of 150 centimeters the height of the arc, i.e., the span of a strung bow amounts to 10 to 12 centimeters. Often, however, the string is almost the length of the bow and no arc results. When shooting the arc is increased by tightening the string to 60 centimeters. Thus the bow is a powerful, mighty [60] sling, which sends off the arrow without any mechanism other than pulling back the string and moving back the bent bamboo. (7)

411
284

7. Bow As, 108, b, has a bamboo string with 5 knots, the shiny side facing inward. The string is 4 millimeters wide in the middle and 7 millimeters wide at the ends. At each end there is a brace cut out of a piece with the string. The string is fastened to the indented tips by means of a threefold bamboo lace (u thri). The string and the bamboo lace are fastened by a strip of bamboo 3 millimeters wide. Illustration I, fig. 1a, height of the arc 9 centimeters,

1 [See category 116, p. 4--Analyst]

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Norgtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Lamai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmiller 1924a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

4.10 **Cottage Industries.**—It has already been mentioned that Village and Cottage Industries are not very popular in the district. 433

The following table shows the industries reported from the sample villages:—

TABLE B-9

Industry (1)	No. of villages reporting existence of the industries. (2)	No. of villages reporting production for sale. (3)	
Cane and bamboo works ...	9	7	322
Blacksmithy	5	5	326
Tailoring	2	2	294
Handloom	...	...	286
Weaving and Spinning ...	3	1	284
Rearing of cocoons, etc. ...	1	1	283
Rearing of lac	1	1	231
Others	2	1	

Blacksmithy and making of baskets, cane products, etc, out of cane and bamboo, are a traditional occupation Weaving and spinning of cotton, rearing of endi cocoon and weaving of endi, etc., are in vague only in the Bhoi area and the areas adjoining Kamrup and North Cachar and Mikir Hills districts. Lac rearing is found in the northern portion of the district, *i.e.*, Nongpoh area. 184

Except cane and bamboo works and blacksmithy other industries are practised in a very limited scale. There is thus a lot of scope for introducing cottage industries in the district.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

243 the District, nor do any superior kinds of cereals appear to have been substituted for inferior ones.

THE DIFFERENT STAGES OF RICE CULTIVATION, in English and Khásí, are as follow:—The blade as it first shows, *spch-u-kyba;* the blade when well above the ground, *la-thylleng-u-kyba;* the ears when first formed, *lam-mat;* the ears beginning to ripen, *byr-kem;* the ripe ears, *la-hih;* unhusked rice, *u-kyba;* husked rice, *u-khaw;* cooked rice, *ka-ja.*

262 THE VARIOUS SOLID AND LIQUID PREPARATIONS made from rice
[435] are the following:—(1) *U-kypu*, cakes of different kinds, sold at six
[782] or twelve for a penny, according to size. (2) *U-shirí* or *gáh-kh[illegible]r*, prepared by the hillmen as an offering to their deity at the conclusion
273 of the harvest. (3) *Kadam*, fermented rice water, sold at the rate
435 of from three-farthings to threepence per quart, according to the strength of the liquor. (4) *Ka kiad-phatika* or *ka kiad-hárak*, a kind of spirits distilled from rice, and sold at from threepence to fourpence-halfpenny per quart.

243 OTHER CEREALS.—Indian corn, or *u-riu-ha-dem*, is grown on homestead lands. The ground is first manured, and the seed is sown about the middle of April. The crop is fit for cutting in September and October. A kind of millet seed called *u-krdi* is commonly sown with paddy on high lands. For want of more suitable land, however, this crop is often cultivated by itself on rocky slopes; and when this course is adopted, the jungle is first cut down in February and burnt. The seed is sown in April, and the crop gathered in December.

244 PULSES AND FIBRES.—Only two kinds of pulses are grown in the Hills, *u-rym-bai-ktung* and *u-rym-bai-já*, both of which are varieties
• 283 of beans. They are sown on high lands in March and April, and gathered in December. The only fibre is that made from the pine-apple stalk, which is largely used for making netted bags.

245 MISCELLANEOUS CROPS.—(1) Oranges.—There are numerous
[439] orange plantations in the neighbourhood of Cherrá Púnjí, and the fruit is exported to all parts of Bengal. In the year 1876-77 the estimated exports were 9,400,000 in number, valued at Rs. 37,600, or £3760, at the rate of Rs. 12 or £1, 4s. per three thousand. These figures show a decrease in number as compared with the estimated export twenty years ago. The trees flower in March or April, and the fruit ripens in October and the following months. In some cases the oranges are allowed to remain on the trees till March, but

4. Illustration I, figs. 2,3,4c.

outer side of the bamboo becomes the inside of the bow. The bow becomes smaller towards the ends. The ends are rounded off. Underneath one end, about 3 centimeters from the end, a notch is made, into which the string is put directly without any other means of fastening. The string remains fastened by pulling the loop taut. At the other end of the bow a peg is cut, around which the string is hung just before the bow is used. Often both ends of the bow end in a point. (5)

5. Illustration I, fig. 1, 2b.

The bow must not be kept strung but must be unstrung when left unused for a while. Stringing the bow is always done in this way. The archer takes the bow in his left hand while standing, resting on the ground the end to which the string always remains attached, and then pressing down the other end with his right hand as far as is necessary to hang the loop of the string around 411 284.

411 the peg. In many cases with bows with the
•284 points indented the string is attached by
means of a special loop of bast or split
bamboo (u thri), but it is also fastened
directly by hanging around the peg. [608]
[Illustration I. Khasi Bows. 1a, 1b, 1c, 2a,
2b, 2c, 3a, 3b, 3c, 3d, 3e, 4a, 4b, 4c].
[609] The bow is carved flat in the middle
and a strip of reed palm is wound around it so
that there is a band 12 to 15 centimeters wide
around it. The purpose of this is to provide
a surer grip, as the left hand, which carries
the bow when shooting, gets a better grip on
the ribbed foundation. In other places also,
primarily at the ends of the bow, such reed
strips are fastened and merely serve the purpose
of ornamentation.

411 When the bow is completed, it is thorough-
322 ly smoked. The smoking takes place in the hut.
In the center of the hut a fire burns constant-
ly in a hearth of earth or of stone, the smoke
of which, since there is no vent or chimney,
seeks a way out the best it can. Above the
fire a swing is set up from the ceiling on
which the wood lies for drying. The bow and
also the string are left lying on this swing
until the desired result occurs. Smoked bows
are more resistant to dampness, longer last-
ing, and considerably tougher. The smoking
has no effect on the flexibility of the bow. (6)

Bows As, 108, a, b, c, have 3
knots; bow As, 28, has 4 knots;
bow J has 3 knots; bow S has 5
knots; bows As, 108, a, b, c,
have a length of 119.5 centi-
meters; bow As, 28 has a length
of 144 centimeters; bow J has a

4:Stegmiller- 54-4,5(no date)1925 AR7&Hazl A17

411
254

length of 141 centimeters; bow S has a length of 156 centimeters; bows As, a, b, c, have a breadth of 22 millimeters in the middle, and 17 millimeters at the ends; bow As, 28, has a breadth of 27 millimeters in the middle and 18 millimeters at the ends; bow J has a breadth of 25 millimeters in the middle, and 12 to 16 millimeters at the ends; bow S has a breadth of 32 millimeters in the middle, and 12 to 18 millimeters at the ends; bow S gets smaller and smaller at an even rate towards the end to which the string is attached just before the bow is shot, while it gets too high at the other end. Height of the bow in the middle is 15 millimeters, at one end 12 millimeters, at the other 17 millimeters; bow J gets smaller and smaller at an even rate towards the end where the string is attached just before the bow is shot, while at the other end it becomes too round. Height in the middle 15 millimeters, at one end 12 millimeters (in the breadth), at the other end 12 millimeters (about on the average). None of the bows has either a wrapped handgrip nor any other ornamentation.

411
283

For making the string (u ksai) the Khasi split a bamboo and split a strip of it off which they smoke thoroughly. The string is uniform for bows with a circular notch; for bows with tapered points, it becomes thicker towards the ends, on which braces are cut from the bamboo knots made from one piece with the string. The kinds of bamboo used for the strings are called u spit, u skhen and u siej-lieh by the Khasi. Bast string, twisted many times, is also used for the string. The bamboo strings are smoked (see above).[1] The strings obtained thus are extremely strong and can stand great tension. With a bow of 150 centimeters the height of the arc, i.e., the span of a strung bow amounts to 10 to 12 centimeters. Often, however, the string is almost the length of the bow and no arc results. When shooting the arc is increased by tightening the string to 60 centimeters. Thus the bow is a powerful, mighty [610] sling, which sends off the arrow without any mechanism other than pulling back the string and moving back the bent bamboo. (7)

411
284

7. Bow As, 108, b, has a bamboo string with 5 knots, the shiny side facing inward. The string is 4 millimeters wide in the middle and 7 millimeters wide at the ends. At each end there is a brace cut out of a piece with the string. The string is fastened to the indented tips by means of a threefold bamboo lace (u thri). The string and the bamboo lace are fastened by a strip of bamboo 3 millimeters wide. Illustration I, fig. 1a, height of the arc 9 centimeters,

1 [See category 116, p. 4--Analyst]

weight of the bow 190 grams. Bows 108, a, b, c, can scarcely have been used for sport, more probably they are children's bows, unless they were made deliberately for selling to Europeans. Bows As, 28, has a bamboo string with five knots, 3 millimeters wide in the middle and 8 millimeters wide at the ends and at both ends there are braces made out of a piece with the string. The outer shiny side of the bamboo string that is turned inward is scraped off with the exception of the ends of the string. There it is split and bent back as a covering for the brace. The string is fastened on both sides of the indented tips by means of a double bast lace. Both are held together with wire. Illustration I, fig. 2a, height of the arc 8 centimeters, weight of the bow 330 grams. Bow J has a bamboo string with two knots, 3 millimeters wide throughout without a brace. It is fastened at the pegs by hanging directly. Weight of the bow 330 grams. Illustration I, fig. 4a, 4b. Bow S has a threefold string of bast. This bast string is hung around the notch and the peg (indented tip) like a loop. The knots that tie the loop are 30 centimeters and 19 centimeters respectively from the ends. Weight of the bow is 449 grams. Illustration I, figs. 3a, 3b, 3c, 3d. Both of the bows mentioned last have no

411
284

411
284

arc height since the strings are as long as the bows.

411
526

The Khasi make the followings kinds of arrows:

1. Feathered arrows ('nam-pur).
2. Unfeathered arrows ('nam).

Feathered or unfeathered ones are: a) hunting arrows, b) arrows for sport. Always feathered are c) children's arrows.

Ad a) Hunting arrows (u 'nam-pliang) are about 70 centimeters long, and have tips like a spear with barbs. (8) The weight of the hunting

8. Illustration II, figs. 2a, 2b.

arrows is about 25 grams. These arrows are still poisoned nowadays.

Ad b) Arrows for sport (u 'nam-sop) are about 60 centimeters long and have round, conical iron tips. (9) Weight of the arrow for

9. Illustration II, fig. 1.

sport is about 8 grams.

Ad c) Children's arrows (u 'nam-phiah) are about 50 centimeters long, and have round points or none at all. The feathering is different from that of the other arrows (cf. the latter).

411

Shafts of the Arrows

All the arrows are made of a very thin bamboo (u 'nam-long or igrâ) and smoked. When possible bamboo free of knots is used. The arrow is about 6 to 7 millimeters thick. The length of the arrow varies greatly. For the arrow and the bow must complement each other inwardly just as they belong together externally.

4.10 **Cottage Industries.**—It has already been mentioned that Village and Cottage Industries are not very popular in the district. 433

The following table shows the industries reported from the sample villages:—

TABLE B-9

Industry (1)	No. of villages reporting existence of the industries. (2)	No. of villages reporting production for sale. (3)	
Cane and bamboo works ...	9	7	322
Blacksmithy	5	5	326
Tailoring	2	2	294
Handloom	...	...	286
Weaving and Spinning ...	3	1	284
Rearing of cocoons, etc. ...	1	1	283
Rearing of lac	1	1	231
Others	2	1	

Blacksmithy and making of baskets, cane products, etc, out of cane and bamboo, are a traditional occupation Weaving and spinning of cotton, rearing of endi cocoon and weaving of endi, etc., are in vague only in the Bhoi area and the areas adjoining Kamrup and North Cachar and Mikir Hills districts. Lac rearing is found in the northern portion of the district, *i.e.*, Nongpoh area. 184

Except cane and bamboo works and blacksmithy other industries are practised in a very limited scale. There is thus a lot of scope for introducing cottage industries in the district.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

352 blackened with the smoke of years, upon which are spread the
417 faggots of resinous fir-wood used for kindling the fire. Above this again is a wooden framework fixed on to the beams of the house, upon which all sorts of odds and ends are kept. Around
352 the fire are to be seen small wooden stools, upon which the members of the household sit. Up-to-date Khasis have cane chairs, but the women of the family, true to the conservative
415 instincts of the sex, prefer the humble stool to sit upon. Well-to-do Khasis nowadays have, in addition to the ordinary cooking vessels made of iron and earthenware, a number of brass utensils. The writer has seen in a Khasi house in Mawkhar brass drinking vessels of the pattern used in Orissa, of the description used in Manipur, and of the kind which is in vogue in Sylhet. The ordinary cultivator, however, uses a waterpot made from a gourd hollowed out for keeping water and liquor in, and drinks from a bamboo cylinder. Plates, or more properly speaking dishes, are of several kinds in the houses of the rich, the two larger ones being styled *ka pliang kynthei* (female) and *ka pliang shynrang* (male). Needless to say, the first mentioned is a larger utensil than the latter. The ordinary waterpots, *u khiew phiang kynthei* and *u khiew phiang shynrang*, are made of brass, the former being a size larger and having a wider mouth than the latter. The pot for cooking vegetables is made of iron. Another utensil is made of earthenware; this is the ordinary cooking pot used in the houses of the poor. Brass spoons of different sizes are used for stirring the contents of the different cooking utensils, also a wooden spoon.

352 In the sleeping-rooms of the well-to-do there are wooden
513 beds with mattresses and sheets and pillows, clothes being
285 hung upon clothes-racks, which in one house visited were of the same pattern as the English "towel horse." The ordinary cultivator and his wife sleep on mats made of plaited bamboo, which are spread on the bare boards of the house. There are various kinds of mats to be met with in the Khasi houses made of plaited cane, of a kind of reed, and of plaited bamboo.
293 The best kind of mat is prepared from cane. In all Khasi
352 houses are to be seen *ki knup*, or rain shields, of different sizes and sometimes of somewhat different shapes. The large

must also be sought out and hired at the markets. 443

3. The Customs of the Market

a) The Preparation for Market. The sellers of both sexes, normally carry their wares to the market themselves. They form smaller or larger groups and travel together. The wares are carried on their backs. The burden is packed according to its bulk or content. Larger objects, such as bamboo poles, beams, sugar cane, grass, and mats are carried without any covering by means of a forehead band plaited of reed grass (u star). Smaller items, such as salt or potatoes, are packed in sacks; others such as betel nuts, pepper leaves, fruit, vegetables, etc. are carried in baskets made of bamboo. The baskets are either pointed baskets which are round at the top or square baskets, which narrow to a point at the bottom but still are four feet long in size. The latter baskets are usually made with a cover, which, like the basket itself, is plaited and almost waterproof, so that flour or salt can be transported in them even during the rainy season. A round or oval object shaped like a shield, which in case of need is used as an umbrella (ka trap) and which is plaited out of bamboo, is inserted between the back and the burden (jingkit). On the one hand this object has the purpose of ameliorating the pressure of the burden and on the other hand it is pulled out in rainy weather to serve as an umbrella when it is held up against the rain by hand. [434] 443 482 438 285 443 [293]

With regard to the weight which the Khasi carry to market, the men carry about 100 and more pounds while the women seldom 482

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmiller 1924a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in April-May and ripens in August - September. For potato, generally three crops are raised in the district ; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

For oranges and betelnut the orchards are cleared of weeds twice a year. Harvesting of orange takes place from October to January. Betelnut ripens at the beginning of the year and are collected between February and May.

2.6.3 **Agricultural implements.**—The usual agricultural implements are a hoe, a sickle, three or four kinds of doas, a harrow, a crowbar which is used for the construction of irrigation channels, 'sierras' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and resembles the one in use in the plains of the State.

2. 6. 4. **General cultural practices.**—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

2.7 **Cottage Industries.**—Cottage Industries, it appears, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, pottery, baskets, mats and jewellery. In striking contrast with other districts weaving of cotton clothes is rare among the Khasis. The Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir Hills practice it only for their domestic consumption. At present, the Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

2.8 **The People.**—The Khasis and Jaintias are a short sturdy race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free from any inhibition. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.38 percent and 3·27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

2.9 **Occupation.**—The greater portion of the population of the district subsists on cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Syntengs in the interior and by the Bhois and Lynngams. The 291
men in the Khasi Hills wear a cap with ear-flaps. The elderly men, or other men when smartness is desired, wear a white turban, which is fairly large and is well tied on the head. Males in the Siemship of Nongstoin and in the North-Western corner of the district wear knitted worsted caps which are often of a red colour. These are sold at Nongstoin market at about [435]
8 or 9 annas each. They are brought to Nongstoin by traders [286]
from the Synteng country, and from Shillong, where they are knitted generally by Synteng women. A small cloth is worn round the waist and between the legs, one end of which hangs down in front like a small apron. The Syntengs wear a somewhat differently shaped cap, having no ear-flaps and with a high-peaked crown. Both Khasi and Synteng caps are generally of black cloth, having, as often as not, a thick coating of grease. The old-fashioned Khasi female's dress, which is that worn by people of the cultivator class of the present day, is the following:—Next to the skin is worn a garment called *ka jympien*, which is a piece of cloth wound round the body and fastened at the loins with a kind of cloth belt, and which hangs down from the waist to the knee or a little above it. Over this is worn a long piece of cloth, sometimes of muga silk, called *ka jainsem*. This is not worn like the Assamese *mekhela* or Bengali *sari*, for it hangs loosely from the shoulders down to a little above the ankles, and is not caught in at the waist; in fact, Khasi women have no waist. It is kept in position by knotting it over both the shoulders. Over the *jainsem* another garment called *ka jain kup* is worn. This is thrown over the shoulders like a cloak, the two ends being knotted in front, it hangs loosely down the back and sides to the ankles. It is frequently of some gay colour, the fashion in Mawkhar and Cherrapunji being some pretty shade of French gray or maroon. Over the head and shoulders is worn a wrapper called *ka tap-moh-khlieh*. This, again, is frequently of some bright colour, but is often white. There is a fold in the *jainsem* which serves as a pocket for keeping odds and ends. Khasi women in cold weather wear gaiters which are often long stockings without feet, or, in the case of the poor, pieces of cloth wound round the legs like putties, or cloth gaiters. I have seen 000

I. Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

headquarters of the Administration. The manufacture of country spirit gives employment to a considerable number of persons, most of whom are females. At a recent census of the country stills in the district, undertaken by the district officials, the number of stills has been found to be 1,530. There must be at least one person employed at each still, so that the number of distillers is probably not less than 2,000, possibly more. The spirit is distilled both for home consumption and for purposes of sale, in some villages almost entirely for sale. In the Jaintia Hills stock-breeding and dealing in cattle provides occupation for 1,295 people, according to the last census. The cattle are reared in the Jaintia Hills and are driven down to the plains when they reach the age of maturity, where they find a ready market amongst the Sylhetis. Cattle are also driven into Shillong for sale from the Jaintia Hills. Another place for rearing cattle is the Siemship of Nongkhlaw, where there is good pasturage in the neighbourhood of Mairang. These cattle are either sold in Shillong or find their way to the Kamrup district by the old Nongkhlaw road. Cattle-breeding is an industry which is capable of expansion in these hills. There are a few carpenters to be found in Shillong and its neighbourhood. The Khasis are said by Col. Waddell to be unacquainted with the art of weaving; but the fact that a considerable weaving industry exists amongst the Khyrwang villages of the Syntengs, and at Mynso and Suhtnga, has been overlooked by him. The Khyrwangs weave a special pattern of cotton and silk cloth, striped red and white. In Mynso and Suhtnga similar cloths are woven, also the sleeveless coat. In former days this industry is said to have been considerable, but it has been displaced to a large extent of late years by Manchester piece goods. The number of weavers returned at the last census in the district was 533. The Khasis and Mikirs of the low country, or Bhois as they are called, weave cotton cloths which they dye with the leaves of a plant called *u noli*. This is perhaps the wild indigo, or *ram*, of the Shan settlers in the Assam Valley. The weavers are almost always females. An important means of subsistence is road and building work; a considerable number of coolies, both male and female, are employed under Government, practically throughout the year, in

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

433 2.7 **Cottage Industries.**—Cottage Industries, it appears, have not
326 found very great favour among the people of the district. A few
[323] families here and there manufacture iron implements, earthenware,
285 pottery, baskets, mats and jewellery. In striking contrast with other
[306] districts weaving of cotton clothes is rare among the Khasis. The
286 Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir
[171] Hills practice it only for their domestic consumption. At present, the
[654] Government is trying to popularise weaving in the district and this has been welcomed by the Khasis. Among other cottage industries
[231] production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

142 2.8 **The People.**—The Khasis and Jaintias are a short sturdy
147 race distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour, they are free
441 from any inhibition. Side by side with the Khasis live the Mikirs, Garos-
563 and Nepalis who form respectively 7.32 percent, 3.38 percent and 3·27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

241 2.9 **Occupation.**—The greater portion of the population of the
[433] district subsists on cultivation. More than 75 percent of the rural
[46] households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

Name of village (1)	Name of society (2)	Sponsored by (3)
7. Sutnga ...	(1) Credit Society.	Local people
	(2) Co-operative Trading Society.	
8. Darrang ...	Marketing Society.	Do
9. Shella ..	Trading Co-operative Society.	Do.

4.10 **Cottage Industries.**—It has already been mentioned that Village and Cottage Industries are not very popular in the district.

The following table shows the industries reported from the sample villages:—

TABLE B-9

Industry (1)	No. of villages reporting existence of the industries. (2)	No. of villages reporting production for sale. (3)
Cane and bamboo works ...	9	7
Blacksmithy	5	5
Tailoring	2	2
Handloom	...	...
Weaving and Spinning ...	3	1
Rearing of cocoons, etc. ...	1	1
Rearing of lac	1	1
Others	2	1

Blacksmithy and making of baskets, cane products, etc, out of cane and bamboo, are a traditional occupation Weaving and spinning of cotton, rearing of endi cocoon and weaving of endi, etc., are in vague only in the Bhoi area and the areas adjoining Kamrup and North Cachar and Mikir Hills districts. Lac rearing is found in the northern portion of the district, *i.e.*, Nongpoh area.

Except cane and bamboo works and blacksmithy other industries are practised in a very limited scale. There is thus a lot of scope for introducing cottage industries in the district.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

241 custom of their own from cultivating the *landoo*, in which
231 case they plant certain other trees favourable to the growth of
784 the lac insect. The villages are situated near their patches of cultivation in the forest. The villages are constantly shifting,
361 owing to the necessity of burning fresh tracts of forest every
241 two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the
342 houses are raised some 3 or 4 ft. from the ground on platforms, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading chillies and
342 other articles to dry. Some Lynngam houses have only one
354 room in which men, women, and children are all huddled
231 together, the hearth being in the centre, and, underneath the platform, the pigs. Well-to-do people, however, possess a
342 retiring room, where husband and wife sleep. A house I measured at Nongsohlar village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a Garo custom. In some Lynngam villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the village festivities go on. These are similar to the *dekachang* or
[171] bachelors' club-houses of the Mikirs, Garos, and Lalungs, and to the *morang* of the Nagas. This is a custom of the Thibeto-Burman tribes in Assam, and is not a Khasi institution. There
[517] are also high platforms, some 12 ft. or 15 ft. in height, in Lynngam villages, where the elders sit of an evening in the hot
[256] weather and take the air. Lynngam houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lynngams keep pigs, they do not seem to be so
352 much *en évidence* as in the Khasi village. There is little
513 or no furniture in a Lynngam house. The Lynngam sleeps on
287 a mat on the floor, and in cold weather covers himself with a

1[of the Lynngams ... (illegible)]

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

quilt, made out of the bark of a tree, which is beaten 352
out and then carefully woven, several layers of flattened 513
bark being used before the right thickness is attained. 287
This quilt is called by the Lynngams "*Ka syllar*" (Garo *simpak*).
Food is cooked in earthen pots, but no plates are used, the broad 252
leaves of the *mariang* tree taking their place. The leaves are 415
thrown away after use, a fresh supply being required for each meal.

The Lynngams brew rice beer, they do not distil spirit; the 274
beer is brewed according to the Khasi method. Games they have 526
none, and there are no jovial archery meetings like those of the Khasis. The Lynngam methods of hunting are setting spring 221
guns and digging pitfalls for game. The people say that now the Government and the Siem of Nongstoin have prohibited both of these methods of destroying game, they no longer employ them. But I came across a pitfall for deer not long ago in the neighbourhood of a village in the Lynngam country. The people declared it to be a very old one: but this I very much doubt, and I fear that these objectionable methods of hunting are still used. The Lynngams fish to a 226
small extent with nets, but their idea of fishing, *par excellence*, is poisoning the streams, an account of which has already been given in this monograph. The Lynngams are omnivorous 262
feeders, they may be said to eat everything except dogs, snakes, the *hulok* monkey, and lizards. They like rice, when they can get it; for sometimes the out-turn of their fields does not last them more than a few months. They then have to fall back on Jolstears and millet. They eat arums largely, and for vegetables they cook wild plantains and the young shoots of bamboos and cane plants. The Lynngams are divided up into 614
exogamous clans in the same manner as the Khasis. The clans 773
are overgrown families. The Lynngams have some stories regarding the founders of these clans, of which the following is a specimen:—"A woman was asleep under a *sohbar* tree in the jungle, a flower from which fell on her, and she conceived and bore a female child who was the ancestress of the Nongsohbar clan." Some of the stories of the origins of other clans do not bear repeating. There do not appear to be any 582.
hypergamous groups. As with the Khasis, it is a deadly sin to 614

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

the ground, and well oiled. A silver ornament, or a few rupees 524
placed at the top, reward the successful climber." A leg of mutton, or a piece of pork fixed at the top of this pole would render the pastime identical with the "greasy-pole" climbing of English villages. The following are some other Khasi games:—

Wrestling: two persons grasping each other's hands with the 526 527
fingers interlocked, and then trying to push one another down; tug-of-war with a piece of stick, the two combatants placing their feet one against the other; butting at one another like bulls, and trying to upset each other (*in tar mnai*): long jump; high jump; blind-man's buff; flying kites; pitching cowries, into a hole in the ground; a game like marbles, only played with round pebbles, and others.

MANUFACTURES.

The manufactures of the Khasis are few in number, and do 32
not seem to show any tendency to increase. On the contrary, 285
two of the most important industries, the smelting of iron ore 442
and the forging of iron implements therefrom, and the cotton-spinning industries at Mynso and Sohtnga, show signs of dying out. Ploughshares and hoes and bill-hooks can now be obtained more cheaply from the plains than from the forges in the hills, and Manchester piece goods are largely taking the place of cloths of local manufacture. The iron industry in 327
former days was an important one, and there is abundant 36
evidence that the workings were on a considerable scale, e.g. at Nongkrem and Laitlyngkot, in the shape of large granite boulders which have fallen to the ground from the sides of the hills owing to the softer rock which filled the interstices between the boulders having been worked out by the iron-workers, their process being to dig out the softer ferruginous rock, and then extract the iron ore from it by means of washing. The softer rock having been removed, the heavier portions fell by their own weight, and rolled down to the bottom of the slopes, the result being the great number of boulders to be seen near the sites of these workings.

l: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

been denuded completely of timber, charcoal being necessary 327
for smelting, has affected the production almost as much as the presence of cheap iron in the market.

MANUFACTURE OF ERI SILK CLOTHS AND COTTON CLOTHS IN THE JAINTIA HILLS.

The number of weavers in the district at the last Census 288
was 533. This number in the Census Report is ascribed to [162]
the cotton industry, no mention being made of weavers of silk. The spinning of Eri silk thread, and weaving it into cloths is, however, a fairly considerable industry amongst the Khyrwang and Nongtung villages of the Jaintia Hills. The Nongtungs and Khyrwangs rear their own Eri worms, and spin the silk from the cocoons. The late Mr. Stack, in his admirable note on silk in Assam, says, "Throughout the whole range of the southern hills, from the Mikir country, Eri thread is in great request for weaving those striped cloths, in which the mountaineers delight," but this observation should have been confined to the Jaintia Hills portion of this district, the Khasis not weaving themselves either in silk or cotton. The Khasis obtain their silk cloths from the Assam Valley, and from the Nongtung or Khyrwang villages in Jaintia. The latter villages have given the name to the striped cloth, *ka jiin Khyrwang*, which is almost invariably worn by the Syntengs. Mr. Stack has given in detail a description of the silk industry in Assam; and it is not therefore necessary to go over the same ground here. The Khyrwang cloth is red and white, mauve and white, or chocolate and white, the cloth being worn by both men and women. The Khyrwang cloths vary in price from Rs. 5 to [435]
Rs. 25, according to size and texture. Those cloths are the handiwork of women alone, and a woman working every day [462]
regularly will take six months to manufacture a cloth valued at Rs. 25; but, as a rule, in the leisurely manner in which they work, it takes a year to complete it.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

COTTON CLOTHS.

283 In the Jaintia Hills at Mynso cotton is spun into thread, and
288 weaving is carried on there, but on a limited scale. The Mynso people weave the small strips of cloth worn by the men to serve the purpose of the Assamese *lengti* or Hindi *languti*. In Suhtnga the people import cotton thread from Mynso and weave the (*ingki*) or sleeveless coat, peculiar to the district; these coats are dyed red and blue. The dark blue or black dye
824 is obtained from the leaf of a plant called *u sybu*, which
386 Mr. Rita has classified as *strobilanthus hoeditolius*, which
288 grows in the gardens round the homesteads. The leaves are dried, then reduced to powder, mixed with hot water, and the skeins of thread are steeped in the liquid. The colour is permanent. The red dye is obtained from the mixture of the dry bark of two shrubs, *ka lapyndong* (*symplocos racemosa*, Roxb.), and *ka 'laruong* (*morinda-tinctoria*, Roxb.), the latter being the same as the Assamese (আচুকাঠ) *áchukáth*. The bark is dried, then pounded, and the two sorts are mixed together and made into a paste with hot water. The skeins are steeped in this mixture for twenty-four hours, then taken out and divided, and again steeped for another twenty-four hours. The Lalungs and Bhois and Lynngams all weave cotton cloths, which are generally dyed blue, sometimes striped blue and red. The Wars weave cotton cloths which are dyed red and yellow, the cloths being woven in checks. Mr. Darrah remarks that the cotton grown in the Jaintia Hills is said to be the best cotton produced in the province. Its thread can be more closely woven than that of other kinds. This statement, however, is not borne out by Mr. Allen writing in 1858, who says that the cotton is of inferior quality, the staple being short and woolly. The cotton cloths woven by the Bhois are called *spua*.

POTTERY.

[162] The Census Report of 1901 gave the number of persons who
323 are supported by the manufacture of pottery at 54 only. Pottery is manufactured at one place only in the Jaintia Hills,

[FACING p. 4]

Khasis are connected with people who inhabited the Malay Peninsula and Chota Nagpur at the time of the Stone Age.* That these people were what Logan calls the Mon-Anam, may possibly be the case. Mr. Peal goes on to state, "the discovery is interesting for other reasons, it possibly amounts to a demonstration that Logan (who it is believed was the first to draw attention to the points of resemblance between the languages of the Mon-Anam or Mon-Khmêr and those of the Mundas and the Khasis), was correct in assuming that at one time the Mon-Anam races and influence extended from the Vindyas all over the Ganges Basin, even over Assam, the northern border of the Ultra Indian Peninsula." Mr. Peal then remarks that the Eastern Nagas of the Tirap, Namstik, and Sonkap group "are strikingly like them (i.e. the Mon-Anam races), in many respects, the women being particularly robust, with pale colour and at times rosy cheeks." The interesting statement follows that the men wear the Khasi-Mikir sleeveless coat. Under the heading of dress this will be found described as a garment which leaves the neck and arms bare, with a fringe at the bottom and with a row of tassels across the chest, the coat being fastened by frogs in front. It is a garment of a distinctive character and cannot be mistaken; it used to be worn largely by the Khasis, and is still used extensively by the Syntengs and Lynngams and by the Mikirs, and that it should have been found amongst these Eastern Nagas is certainly remarkable. It is to be regretted that the investigations of the Ethnographical Survey, as at present conducted, have not extended to these Eastern Nagas, who inhabit tracts either outside British territory or in very remote places on its confines, so that we are at present unable to state whether any of these tribes possess other points of affinity, as

412 171 144 141 144 291 171 144 211 171

* It is interesting to compare the remarks of M. Aymonier in his volume iii. of "Le Cambodge." He writes as follows:—"Mais en Indo-Chine on trouve, partout disseminé, ce que les indigènes, au Cambodge du moins, appellent, comme les peuples les plus éloignés du globe 'les traits de foudre.' Ce sont ici des haches de l'âge néolithique ou de la pierre polie, dont la plupart appartiennent au type repandu en toute la terre. D'autres de ces celtes, dits épaulés, parcequ'ils possèdent un talon d'une forme particulière, paraissent appartenir en propre à l'Indo-Chine et à la presqu'île dekkhanique. Ils fourniraient donc un premier indice, non négligeable, d'une communauté d'origine des populations primitives des deux péninsules, cis et trans gangétiques."

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

171 Southern Moluccas the placenta is mixed with ashes, placed in
144 a pot, and hung on a tree; a similar custom is observed in Mandeling, on the west coast of Sumatra. This is a custom universally observed amongst the Khasis at births. Teknonomy to some extent prevails amongst some of these Malay tribes as with the Khasis. It will be seen from the above notes that there are some interesting points of affinity between the Khasis and some of the Malay tribes, and if we add that the Khasis are decidedly Malay in appearance, we cannot but wonder whether the Malays have any connection not only with the Mon-Khmêr family, but also with the Khasis, with the Ho-Mundas, and with the Naga tribes mentioned by Mr. Peal in his interesting paper published in the Journal of the Asiatic Society of Bengal, already referred to. We will study the strong linguistic affinities between these peoples in the section which deals with language.

M. Aymonier in "Le Cambodge" mentions the matriarchate as having been prevalent apparently amongst the primitive races of Cambodia, and notes that the ancient Chinese writers spoke of Queens in Fou-nan (Cambodia). If the Khmêrs were the ancient people of Cambodia, here we have an important landmark in common between them and the Khasis. M. Aymonier goes on to speak of priestesses, and the Cambodian taboo, *tam* or *trenam*, which Mr. Lowis, the Superintendent of Ethnography in Burma, suggests may be akin to the Khasi *sang*.

DRESS.

291 Dress may be divided into two divisions, ancient and modern. It will be convenient to take the former division first. The Khasi males of the interior wear the sleeveless coat or *jymphong*, which is a garment leaving the neck and arms bare, with a fringe at the bottom, and with a row of tassels across
[177] the chest; it is fastened by frogs in front. This coat, however, may be said to be going out of fashion in the Khasi Hills, its place being taken by coats of European pattern in the more civilized centres and by all sorts of nondescript garments in the interior. The sleeveless coat, however, is still worn by many

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Syntengs in the interior and by the Bhois and Lynngams. The 291
men in the Khasi Hills wear a cap with ear-flaps. The elderly men, or other men when smartness is desired, wear a white turban, which is fairly large and is well tied on the head. Males in the Siemship of Nongstoin and in the North-Western corner of the district wear knitted worsted caps which are often of a red colour. These are sold at Nongstoin market at about [435]
8 or 9 annas each. They are brought to Nongstoin by traders [286]
from the Synteng country, and from Shillong, where they are knitted generally by Synteng women. A small cloth is worn round the waist and between the legs, one end of which hangs down in front like a small apron. The Syntengs wear a somewhat differently shaped cap, having no ear-flaps and with a high-peaked crown. Both Khasi and Synteng caps are generally of black cloth, having, as often as not, a thick coating of grease. The old-fashioned Khasi female's dress, which is that worn by people of the cultivator class of the present day, is the following:—Next to the skin is worn a garment called *ka jympien*, which is a piece of cloth wound round the body and fastened at the loins with a kind of cloth belt, and which hangs down from the waist to the knee or a little above it. Over this is worn a long piece of cloth, sometimes of muga silk, called *ka jainsem*. This is not worn like the Assamese *mekhela* or Bengali *sari*, for it hangs loosely from the shoulders down to a little above the ankles, and is not caught in at the waist: in fact, Khasi women have no waist. It is kept in position by knotting it over both the shoulders. Over the *jainsem* another garment called *ka jain kup* is worn. This is thrown over the shoulders like a cloak, the two ends being knotted in front, it hangs loosely down the back and sides to the ankles. It is frequently of some gay colour, the fashion in Mawkhar and Cherrapunji being some pretty shade of French gray or maroon. Over the head and shoulders is worn a wrapper called *ka tap-moh-khlieh*. This, again, is frequently of some bright colour, but is often white. There is a fold in the *jainsem* which serves as a pocket for keeping odds and ends. Khasi women in cold weather wear gaiters which are often long stockings without feet, or, in the case of the poor, pieces of cloth wound round the legs like putties, or cloth gaiters. I have seen 000

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

[FACING p. 20]

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

291 I have seen women at Nongstoin wearing gaiters of leaves. It was explained to me that these were worn to keep off the leeches. The Khasi women might almost be said to be excessively clothed—they wear the cloak in such a way as to hide entirely the graceful contours of the figure. The women are infinitely more decently clothed than Bengali coolie women, for instance; but their dress cannot be described as becoming or graceful, although they show taste as regards the blending of colours in their different garments.

The dress of the Synteng women is a little different. With them the *jain khrywang* takes the place of the Khasi *jainsem*, and is worn by them in the following manner:—One of the two ends is passed under one armpit and its two corners are knotted on the opposite shoulder. The other end is then wound round the body and fastened at the waist, from which it hangs half way down the calf. Over this they wear a sort of apron, generally of *muga* silk. They have the cloak and the head-wrapper just the same as the Khasi women. The Synteng striped cloth may be observed in the picture of the Synteng girl in the plate. Khasi women on festive occasions, such as [302] the annual Nongkrem puja, do not cover the head. The hair is then decked with jewellery or with flowers; but on all ordinary occasions Khasi women cover the head. Wár women, however, often have their heads uncovered.

Modern Dress.—The up-to-date Khasi male wears knicker-bockers made by a tailor, stockings, and boots; also a tailor-made coat and waistcoat, a collar without a tie, and a cloth peaked cap. The young lady of fashion dons a chemise, also often a short coat of cloth or velvet, stockings, and smart shoes. Of course she wears the *jainsem* and cloak, but occasionally she may be seen without the latter when the weather is warm. It [293] should be mentioned that the Khasi males are seldom seen without a haversack in which betel-nut, lime, and other odds [415] and ends are kept; and the female has her purse, which, however, is not visible, being concealed within the folds of her lower garment. The haversack of the men is of cloth in the high plateau and in the Bhoi country, but it is of knitted fibre in the Wár country. The Syntengs have a cloth bag, which they call *ka muna*.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

291 The Wár men dress very much the same as the neighbouring Sylheti Hindus. The Wár women, especially the Shella women, wear very pretty yellow and red checked and striped cloths. The cloak is not so frequently worn as amongst Khasis, except in cold weather. The Lynngam dress is very similar to that of the neighbouring Garos. The males wear the sleeveless coat, or *phong marong*, of cotton striped red and blue, red and white, or blue and white, fastened in the same manner as the Khasi coat and with tassels. A small cloth, generally red or blue, is tied between the legs, one end of it being allowed to hang down, as with the Khasis, like an apron in front. A round [554] cap is commonly worn; but the elderly men and people of importance wear turbans. The females wear short cloths of cotton striped red and blue, the cloth reaching just above the knee, like the Garos; married women wear no upper clothing, except in winter, when a red or blue cotton cloth is thrown loosely across the shoulders. The women wear a profusion of blue bead necklaces and brass earrings like the Garos. Unmarried girls wear a cloth tightly tied round the figure, similar to that worn by the Kacharis. A bag of cloth for odds and ends is carried by the men slung across the shoulder. It should be [554] mentioned that even in ancient times great people amongst the Khasis, like Siems, wore waist-cloths, and people of less consequence on great occasions, such as dances. The use of waist-cloths among the Khasis is on the increase, especially among those who live in Shillong and the neighbouring villages, and in Jowai and Cherrapunji.

TATTOOING.

304 None of the Khasis tattoo; the only people in the hills who tattoo are certain tribes of the Bhoi country which are really Mikir. These tattoo females on the forehead when they attain the age of puberty, a straight horizontal line being drawn from the parting of the hair down the forehead and nose. The line is one-eighth to one-quarter of an inch broad. The Lynngams occasionally tattoo a ring round the wrist of females.

769 171 *'iaw*, short for *kiaw* (grandmother), and *bei*, mother. *Ka Iawbei* is the primeval ancestress of the clan. She is to the Khasis what the "tribal mother" was to old Celtic and Teutonic genealogists, and we have an interesting parallel to the reverence of the Khasis for *Ka Iawbei* in the Celtic goddess Brigit, the tribal mother of the Brigantes. Later on, like Ka Iawbei, she was canonized, and became St. Bridget.*

769 578 787 776 The greater number of the flat table-stones we see in front of the standing monoliths in these hills are erected in honour of *Ka Iawbei*. In former times, it was the custom to offer food to her on these stones. In cases of family quarrels, or dissensions amongst the members of the same clan, which it is desired to bring to a peaceful settlement, it is customary to perform a sacrifice to the first mother, "*Ka Iawbei*." They first of all take an augury by breaking eggs, and if it appears from the broken egg-shells that *Ka Iawbei* is offended, they offer to her a cotton cloth, and sacrifice a hen. [534] On these occasions incantations are muttered, and a small drum, called, "*Ka 'sing ding dong*," is beaten. It is not unlikely that the Khasi household deities, *Ka lei iing*, and *Ka ksaw ka jirngam*, to whom pujas are offered for the welfare of the house, are also *Ka Iawbei* in disguise. Notwithstanding the strong influence of the matriarchate, we find that *U Thawlang*, the first father and the husband of *Ka Iawbei*, is also revered. To him on occasions of domestic trouble a cock is [291] sacrificed, and a *jymphong*, or sleeveless coat is offered. This puja is called *kaba tap Thawlang*, i.e. covering the grandfather. The following incantation to *U Thawlang* is then chanted:—"Oh, father Thawlang, who hast enabled me to be born, who hast given me my stature and my life, I have wronged thee, oh father, be not offended, for I have given thee a pledge and a sign, i.e. a red and white sleeveless coat. Do not deliver me into the power of (the goddess of) illness, I have offered thee the propitiatory cock that thou mayest carry me in thine arms, and that I may be aware of thee, my father Thawlang."

769 171 We see clearly from the above prayer that the Khasi idea is that the spirit of the deceased male ancestor is capable of

* Karl Pearson's essay on "mother age civilization."

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

The bridegroom then sets out with this man and a number of followers, clothed in clean garments and wearing either white or red pagris (a black pagri not being considered a fitting head-dress on this occasion), to the house of the bride, where a feast has been prepared, and fermented rice-beer (*ka-kiad-hiar*) in gourds (*klong*) placed ready. The bride, her female attendants, and her mother and aunts have collected in the meantime, dressed in their best, wearing their jewellery, and with their heads uncovered, for it is not thought proper for the females to cover their heads on the marriage day. On the side of the bride, also, a *ksiang* (go-between) has been appointed, and it is his duty to manage all the business of the marriage on behalf of her family. Some young men of the bride's party go to meet the bridegroom's contingent by way of doing them honour. When they have reached the bride's house, the *ksiang* of the bridegroom enters first, followed by the bridegroom, and after him the bridegroom's party. The *ksiang* then hands over the bridegroom to the maternal uncle (*kni*) of the bride, or to the bride's father. Either of the latter then provides the bridegroom with a seat next the bride. The bride and bridegroom exchange bags of betel-nut, and where the custom of investiture of the ring is in vogue, these tokens are interchanged. The *ksiangs* of the bridegroom and bride recite the marriage contract in lengthy formulae, which may be found on pages 6, 7, 8 of the late U Jeebon Roy's interesting notes on the Khasi religion. The two *ksiangs* then take up, each of them, a gourd containing fermented liquor from the gourd provided by the contracting party, and give them to an old man who is versed in sacrificial lore, who solemnly mixes the contents together. Three dried fish are produced, and are placed on the floor of the house. The priest thus appointed then solemnly adjures the gods in the following words:—

Hei, oh god from above; oh god from below; oh *'lei synshar*; oh god who hast created man; as thou hast ordained this marriage, the ring has been given this day; thou wilt know; thou wilt hear; from the clear firmament above that . . . . have been married this day. Thou wilt bless them; thou wilt grant them prosperity; thou wilt show them the way; thou wilt show them the road, that they may be well, that they may obtain dwellings and houses,

585 of a Garo marriage. The Lynngams, unlike the Garos, do not
982 observe which way the beaks of the fowls turn when they are thrown on the ground after being sacrificed. The Lynngams,
787 like the Khasis, take auguries from the entrails of the fowls and the pig. After these ceremonies are over, the Lynngam pair are allowed to cohabit. The cost of an ordinary Lynngam
585 marriage is from Rs. 30 to Rs. 40. The marriage system in
435 vogue among the Lynngams may be described as a mixture of the Khasi and Garo customs. As has already been stated,
161 the Lynngams are a mongrel breed of Khasis and Garos.

CEREMONIES ATTENDING DEATH.

764 The death customs of the Khasis are not only very elaborate, but possess a significance of their own, it is, therefore, necessary to describe them in detail; they are as follows:—

763 A member of the family bends down towards the ear of the apparently deceased person and calls him or her by name three times, to make sure that death has occurred. If no answer comes, the family laments, for it is then con-
964 cluded that the person is really dead. The body is then bathed in warm water from three earthen pots and is reverently
291 laid on a mat (*jiepung*), where it is dressed in white cloth, a peculiar feature of the dressing being that the waist-cloth and turban are folded from left to right, and not from right to left, as in the case of the living. An egg called *u'leng kpoh*
764 is placed on the stomach of the deceased, and nine fried grains, of *rim hadem*, or Indian corn, are tied round the head with a string. The rich place ear-rings in the ears and other jewellery on the body of the deceased, it being necessary that this jewellery should be specially made for the occasion, and they
[775] deck the corpse with valuable cloths. A cock, *u'iar kmed lyati* (literally the cock that scratches the way), is sacrificed, the idea being that a cock will scratch a path for the spirit to the next world. A sacrifice of a bull, or of a cow in case the deceased is a woman, (*u* or *ka masi pynsem*,) follows. Portions of the left leg of the fowl and the lower part of the jaw of the bull or cow are kept, to be placed afterwards in the *mawshieng*, or bone,

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

535 women from the Wár country, wearing their picturesque dress, amongst whom was the wife of the Siem of Bohwal with her little daughter. The dance was a pretty sight, and I have [752] seldom seen such evidence of unaffected happiness as was exhibited by the people on this occasion. Dancing may be described as one of the characteristic features of Khasi life.

796 The Synteng *Beh-dieng-khlam* festival takes place annually 789 at Jowai and elsewhere in the Jaintia Hills in the deep water moon month (*u Jyllieu*, or June). *Khlam* is the Khasi word for plague or pestilence, and *beh-dieng* signifies to drive away with sticks. The festival may be described as follows:—The males rise betimes on the day fixed and beat the roof with sticks, calling upon the plague-demon to leave the house. Having done this, later on in the day they go down to the stream where the goddess "Aitan" dwells. Then poles of great length, which have been newly cut, are held across the stream. The people jump on the poles and try to break them; when they succeed in doing so, a great shout is given. After all these poles have been broken, a very large pole is fixed across the stream. The people then divide themselves into two parties, and contend for the possession of the tree. The contest, however, is a good-humoured one, and although many buffets are given and received, these are not regarded seriously, and there [291] are seldom any fights. Col. Bivar says the contending villagers, in their excitement, sometimes relapse into a state of almost complete nudity. The party which succeeds in obtaining possession of this post is supposed to gain health and prosperity [796] during the coming year. Col. Bivar remarks that the origin of this so-called ceremony is said to be that the god of thunder, "*u'lei pyrthat*," and Ka Aitan, the goddess of the stream, enjoined its performance. Many innovations, however, have crept in. People disguise themselves as giants and wild beasts, they also parade images of serpents, elephants, tigers, peacocks, [535] &c. Dancing is carried on with enthusiasm by the males, the [536] girls, clad in their best attire, remaining on-lookers. Before the meeting breaks up the males play a sort of game of hockey with wooden balls.

considering. Some of the leading characteristics of the Lyngngams will now be detailed. The Lyngngams are by complexion swarthy, with features of Mongolian type. The men are of middle height and the women remarkably short, both sexes being not nearly so robust as the Khasis, a result due probably to climatic influences, for the Lyngngams live in fever-haunted jungles. The men have very little hair about the face, although a scanty moustache is sometimes seen, the hairs in the centre being carefully plucked out, the result being two tufts on either side. Beards are never seen. The women are ill-favoured, and wear very little clothing. The men wear the slovenly coat of the Khasi and Mikir pattern, called *phong-maromg*, which is made of cotton dyed red, blue, and white. This custom may have been borrowed from the Khasis. They do not grow their own cotton, but obtain it from the plains. They make their cloth from slaughtering (*ruid*) and *kaw* and *lang* (black). A cotton cloth, barely enough for purposes of decency, is tied between the legs, the ends being allowed to hang down in front and behind. Sometimes an apron is worn in front. At the present day the men wear knitted woollen caps, generally black or red, of the Nongstoin pattern (a sort of fisherman's cap), but the elderly men and head-men wear turbans. The females wear a cotton cloth about eighteen inches broad round the loins, sometimes striped red and blue, but more often only dark blue. A blue or red cloth is thrown loosely across the shoulders by unmarried girls, but married women only wear the waist-cloth, like the Garos. A cloth is tied round the head by married women, sometimes, Garo fashion. The women wear quantities of blue beads as necklaces, like their Garo sisters. They obtain the beads from the Garo markets at the foot of the hills. Brass ear-rings are worn by both sexes; the women, like the Garos, load their ears to such an extent with brass rings as to distend the holes greatly. Silver armlets are worn by the head-men only, or by those who possess the means to give a great feast to the villagers. This is the custom of the Garo *sokmas*, or head-men. Both sexes wear bracelets. The men also wear necklaces of beads. The rich wear necklaces of cornelian and another stone which is thought by the Lyngngams to be valuable. A necklace of such stones is called *u'pirsig bôi* (god's necklace).

JOURNAL

OF THE

ASIATIC SOCIETY OF BENGAL.

VOL. LXXIII. PART III.—ANTHROPOLOGY AND COGNATE SUBJECTS.

No. 4.—1904.

101 *Note on the Khasis, Syntengs, and allied Tribes, inhabiting the Khasi and Jaintia Hills District in Assam.—By* MAJOR P. R. T. GURDON, *Superintendent of Ethnography in Assam.* (With plates III—IV).

[Read 3rd August, 1904.]

102 1. *Physical characteristics.*—The men are seldom tall; they are generally well made, and possess great strength of limb,—of leg in particular. Their features show a resemblance to those of the Japanese; their complexions are fair, noses flat, lips thick, and eyes very frequently obliquely set. The women are good-looking, of a bonny type, and are cheerful and pleasant-mannered. Children are sometimes exceedingly pretty. Khasis are inveterate chewers of *pân*,—both men, women, and children; the distances from place to place being measured by the number of betel-nuts that can be chewed on the journey. The hair of the males is shaved above the forehead pretty high up, and the remainder is gathered into a knot at the back of the head. Very few Khasis have much hair about the face. Both Khasis and Syntengs wear the characteristic coat (*jymphong*) loin-cloth, *jein sliang* (a kind of

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

291 small kilt), and a cap which is peaked in front and which comes down well over the ears, called (*ka tupia skhor*) ear cap. The dress of the Khasi females is somewhat different from that of the Synteng, the former wears a striped cloth tied round the waist, hanging down to the knees, and another cloth, with a fringed border, knotted on both the shoulders to cover the bust and a narrow cloth, called *ka jympies*, to serve the purpose of under-clothing. A cloth knotted in front is also worn like a cloak over shoulders. The Synteng woman wears a cloth smoothed round the body fastened above the bust and drooping down to the ankles. Another cloth is thrown over the shoulders, and crossed in front. Both Khasi and Synteng women wear a cloth tied over the head, called *ka tap* mokhlieh. Up-to-date Khasi males wear knicker-
292 bockers, stockings, and boots, and females chemises. On festive occasions, both Khasis and Syntengs, males and females, wear expensive silks, with earrings of gold or silver. There is a special dancing-dress of
301 elaborate pattern. The women at festivals wear a circlet of silver with a spear-head ornament behind, rising 4 or 5 inches from the back of the head. Large coral beads are much valued, and necklaces of alternate beads of coral and gold, and sometimes of coral alone, are worn by the chiefs and their principal followers. Such necklaces are worn by
262 women also on *gala* occasions. The staple diet of both Khasis and Syntengs is rice and dried fish. They are, however, fond of all kinds of meat, especially pork. Some of the Syntengs abstain from beef,
[11] owing no doubt to Hindu influences. Neither Khasis nor Syntengs eat dog, which is partaken of with zest by the Naga and the Garo tribes,—this is owing to the dog being considered by the Khasis to be the friend of man. Neither Khasis nor Syntengs use milk, the latter being thought by them to be an excrement. Neither Khasis nor Syntengs
411 tattoo. The weapons of both Khasis and Syntengs are bows and arrows, swords and shields. The national game of the Khasis is archery, regarding which a detailed description will be found in paragraph 10.

The people live in regular villages on fixed sites which have not
341 changed for generations,—and they appear to be much attached to those sites, where, as a rule, the family tombs are standing. The houses are
342 built in the shape of a shell, the houses being divided into three compartments,—the *Shyngiup*, or porch, where odds and ends, and sometimes fowls, are kept; *nongpoi*, or centre room, which is used for cooking and sitting in; and *rumpoi*, or inner room, where the people sleep. The houses are low, with grass roofs reaching nearly to the ground, the beams are of hewn timber, the walls are of either planks roughly hewn or of reeds or split bamboos plastered with clay. The Khasis' houses generally have boarded floors raised some feet from the ground level,

Shella

Confederacy forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people. 621

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards along the steep slope, looking down towards the Bengal plain. The climate of this part of the hills is considered to be one of the worst in tropical India for human habitation. The Bengal plain, though warmer than this area, is considered more healthy. This border land is the zone of malaria, typhoid, black fever, cholera, etc. None of the Bengalee peasants dare to live in such an area. However, it is the most fertile for products such as betel-nuts, pan-leaves, oranges, bananas and pineapples, and it also produces limestone. These people seem to prefer to settle in this zone and to enjoy its prosperity, at the expense of human lives: every year, especially between March and September, the inhabitants suffer from various fevers and dysentry and other diseaes, many of the weaker facing death. 131 132 164 433 164 648

Before the Partition of India and Pakistan, the products of Shella were carried down the Shella River to Sylhet, one of the biggest centres in East Bengal, which brought unimaginable wealth to the Shella people. Their houses were built by carpenters from Sylhet. The style and structure of these houses were exceptionally elaborate for the Khasi. They purchased vast rice fields in the plain, which used to be cultivated by Bengalee and Garo labourers engaged by them. These Khasi do not themselves know how to cultivate rice fields; they have always been managers or landowners. Their boys used to be sent to high schools and colleges in Sylhet. As a result of their trading with the Bengalee, many of them read and speak fluent Bengalee. There is no difference between their style of clothing and that of the Bengalee, though the women maintain their traditional dress in the Shella style. 177 178 434 [439] [342] [166] [464] [871] [191] [291]

They have thus been distinguished from the rest of the Khasi not only geographically, but also economically and culturally. Their personality also differs sharply from the rest of the Khasi. They are very sociable, and quick, a quality lacking among the Khasi of Sohkynduh and Kongton. They are clever enough to deal with strangers. The upland Khasi say Shella people are very cunning. This remark shows one side of these people. They had to be cunning, since they traded with the Sylhet Bengalee who were said to be the most cunning of their race. Their role in the trade and in the history of the modernization of the Hills was considerable. For centuries they represented intellectual Khasi owing to their contact with Hindu civilization, while the Hills remained in darkness. They assumed an important role when the British established an administration in the Hills, and even up to now, many leading Khasi originated from this area: for instance, Lati Hat, the first interpreter of the British Headquarters at Cherrapunjee; Jeebon Roy, who was the first Magistrate among the Khasi; Maham Sing, a lawyer and Member of the Legislative Assembly (the grandson of Jeebon Roy); Nichols Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nichols Roy), Principal of the Gauhati University, etc. 157 184 648 177 178 [439]

Through constant cultural contact with Hindu, and encouraged by their economic prosperity, the Shella Khasi, like the Jaintias, have been much influenced by Hindu culture. However, this does not mean that the people of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, and some ceremonial elements were borrowed from the Hindu, most of the 177 648 771 795

17: Banerjee E-5 (1955) 1962 AR7 Khasi AR7
Smit

796 The goats were sacrificed by his sister's eldest son (*Siem-khynnah*) and in
782 charge of respective units at the open courtyard. The priests evoked the
ancestors and ancestress and called upon them by name praying 'Oh God and
769 Goddess, I offer this sacrifice as our ancestors did. Bless the *Siem*, his family
and the people of his state. I shall beseech you again on this day after one
231 year. You create favourable weather by virtue of your power, bring clouds and rains to yield bumper crops and ensure a happy and prosperous life.'

On the last day (Nongkrem), a man of Mawroh clan sacrificed a pig introducing an iron spike in its left armpit. Nine pieces of meat from different parts of the pig's body were again offered to their five ancestors. The *Siem* in the presence of his *Darbar* performed the last item of festival by praying to U Shillong, when the Chief of Rynjah clan also followed in the same way for seeking the blessings of their Chief deity.

This brought the ritual to an end performed at the residence of *Siem*. The five pieces of goat's and pig's meat offered to their five ancestors, were then handed over to the in-charge of the five units considered as somewhat higher in their State organisation. They distributed them at a suitable place in their unit, making a feast as a sort of public declaration of the completion of their greatest festival for the year.

DANCING

535 Besides the ritual described above, dance with the accompaniment of music
796 formed an important aspect of this festival. A dance known as *sad-tyngkoh*
had been a regular feature for the first, second, third and fifth day. This dance
[533] has some interesting features. It has to be performed in pairs. The first pair was constituted by Chief priest and the Chief musician. Second to fifth pairs were between the *Sirdars* of the eight units after which *Siem* along with an official of his council constituted the sixth pair. The subsequent pairs were formed by any two persons from the gathering. They danced only after bowing first before the Oak pillar (Rishot), then to *Siem* on the fifth day. This pairing was then not adhered to on completion of the last rite of the festival.

A second type of dance (*Ka sad mastieh*) was then performed in the courtyard by the musicians as well as by the professional dancers (nong-shad) with sword and fly-brush in the afternoon of the third day. The dance was always
[291] held in pairs first by musicians, and then dancers, who donned their traditional
[301] dress consisting of silk turban (Jainspong) decorated with feathers, coloured sleeveless coat (Jymphong) silver chains and coral necklaces. Later on they joined the procession, that went to the adjacent hill where after the completion of the ceremony of goat killing, a group dance was performed returning to the residence of *Siem* ultimately.

This dance (*sad-nohkjat*) was performed by the Siems family. It was held early in the morning of the fourth day in the central hall (Shlur) and also
[291] in the courtyard. The men put on their normal dress whereas the women
[301] dressed themselves with gold and silver crown (pansngiat), numerous silver ornaments and different coloured blouse. They dressed and braided the hairs into a knot just at the nape. The High Priestess who also danced with the membes of the Siems' family, stood in the middle of the line and chief
[302] musician stood at one end. They hold each other in hand and danced round the fire-place of the central hall (Shlur) in anti-clock-wise direction in accompaniment of music. The people assembled there, gave vent to their feeling in their customary way every time, before they resumed to make it three times. Similar performance of dances were also held in the courtyard.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

144 'ETHNOLOGY.—In order to determine the ethnological position of the Khásiás, we need dwell upon a few only of their physical characteristics, viz. those which are held to indicate that type of the human family, the Mongolian, to which they undoubtedly belong. A detailed description of their physiognomy would embrace forms and characters by no means common even to tribes occupying the hills in close proximity to them, much less referable to all branches of the Mongolian stock. These differences in detail, which may be attributed mainly to local influences, render it extremely difficult, if not absolutely impossible, to trace out the exact relation which these mountain tribes bear to each other. But the Mongolian, or to use a more comprehensive term, the Turanian, physiognomy is unmistakeable in them all—Khásiás, Jáintiás, Gáros, Míkírs, Nágás, Manipuris, etc. The chief points may be briefly stated as follows:—
142 Colour tawny or yellow, though a darker hue is not entirely
[141] unknown; nose somewhat depressed, with a peculiar conformation
[302] towards the forehead at the glabellum, which is very flat and broad; face broad, flat, and squarish, with high and rounded cheek-bones; skull globular rather than square; eyes middle-sized and black, with a yellow tinge in the eyeball; eyelids obliquely set, but less acutely than in the Chinese and other Indo-Chinese races; mouth large, with prominent though not very thick lips; hair black, thick, and worn long, the orthodox style being to tie it up in a knot at the back, varying little with sex; beard remarkably sparse, but the
141 moustache more abundant than the beard. The lower classes go
[826] bare-headed; stature low in the majority of cases; constitution strong and robust; limbs thick, short, and stout; trunk long in proportion and very broad at the waist; calves over-developed, but this is considered an element of beauty, more especially in the women, who, on the average, are fairer and handsomer than the men; carriage ungraceful.

157 'SOCIAL AND MORAL QUALITIES.—Disposition very affable, gentle, and cheerful; rather industrious, but devoid of ingenuity and mechanical skill. In the industrial arts, such as masonry, carpentry,
• 291 and agriculture, they are amenable to training. Dress amongst the lower classes is confined to a fringed jacket rudely woven of hemp, extending down as far as the thighs, and leaving the arms bare, together with a scanty covering for the loins. The more respectable classes wear a turban of coarse cotton or silk for a head-dress, and a sheet of silk thrown loosely over the shoulders, together with a long

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

strip of fine silk for the loins, a part of which hangs gracefully as low as the calves in front. No notice is here taken of what has undoubtedly been added and borrowed from their more civilised neighbours in the plains. 291

'MARRIAGE.—The marriageable age for females is from 15 to 18; for males, from 18 to 24. Matrimonial alliances are contracted either through the parents or the living representatives of the families to which the parties belong. The mode of procedure is still very primitive and unceremonious. The bridegroom, escorted by a number of friends and relatives, goes to the house of the bride, where all are feasted and lodged for the night; on the morrow he leads the bride, accompanied by a number of her relatives, to his own house, and entertains the company with dishes of boiled rice and fresh pork. After remaining there a day or two, the newly-married couple return together to the house of the wife, which becomes their future home. Marriage is dissoluble by regular divorce, for any sufficient cause, and often without any assignable reason except mutual dislike or want of issue, the latter being the most common case of all. Marriage with the Khásiás is simply a conventional arrangement, with nothing further for its object than the procreation of children; failing that, it is no longer looked upon as a contract permanently binding. Divorce is effected in the presence of eye-witnesses—the parents, or the heads of clans. Five cowries (*kaurís*) are produced by the parties and exchanged, then cast away by mutual consent, and the ceremony is over. Parties once divorced can never again contract marriage with each other, but they are at liberty to marry into other families. Polygamy, strictly so called, is not sanctioned by Khási custom. Adultery is looked upon as a serious crime. If the five cowries have not been cast away by mutual consent, both husband and wife are held to be subject to the "matrimonial demon;" and even when either dies in wedlock, the survivor is not at liberty to contract a fresh alliance until he or she pays the family a sum of money as the means of removing the surviving party from subjection to the "matrimonial demon." The husband is a stranger, so to speak, in the family he has entered, and perpetuates the race of others, not his own. The children in all questions of lineage and personal rights follow the mother. There are always two interests in the same family—that of the husband, and that of the wife. Whatever the husband may have earned or acquired in

301 plate. The hair is worn tied in a knot behind the head, but with
302 a long tail hanging down the back. Rich silk cloths are worn
535 by the girls, who present the appearance of being, if any-
[292] thing, over-clothed, or, as Yule aptly puts it, of "perfect
796 parallelograms." They wear a profusion of gold and coral
782 bead necklaces, silver and gold chains, bracelets, ear-rings of gold, and any other jewellery they can lay hands on. Not only is the whole of the family jewellery requisitioned by the fair *débutante* (it is only the unmarried girls who dance), but she borrows from her friends. The men dance round the outside of the circle, waving fly-flaps and prancing (often nowadays wear-
[534] ing huge boots) with ungainly strides. The music necessary for the dance consists of *tangmuri* (pipes), drums, and cymbals.
[292] This is *ka shad kynthei*, or the dance of the women. Then there is *ka shad mastieh*, or the dance of the men, who are gaily dressed, wearing plumes of black and white cock's feathers (*u thuiyah*) and hold swords and shields. After gyrating for some time, two men at a time rapidly approach one another and clash their swords together in mock combat. They then retire, and, after again revolving for a period, repeat the process; then other couples follow and take their place. This goes on until the dancers get tired or are told to stop.

535 The above description may be taken as applicable to all
764 the Khasi dances. Dancing forms part of the ceremony of placing the ashes in the sepulchre of the clan. Dancing also forms a part of certain ceremonies performed at markets for the prosperity of the State and for the good of trade.

535 When I was at Mawsynram, at the time of the appointment of a Siem, I witnessed a very pretty dance called *ka shad lymmoh*, performed by men who held the leafy branches of trees in their hands. This is most effective. Then
[301] followed a dance of some forty young girls, very well dressed, covered with the usual gold and coral beads and silver chains, and wearing the silver crown, or *pansngiat*. The young women danced with great spirit, and with an absence of all shyness, but still with the greatest decorum. Many of the women, spectators as well as dancers, were observed to be without the usual *tap moh khlih*, or head-cloth, the absence of which is always a sign amongst the Khasi women of merry-making. There were

764 the maw shying, the place of temporary keeping.

The second burial occurs later, when the bones are transferred from the maw shying into the maw phew. Maw phew are places for keeping the ashes of members of a narrower family circle. The bones of the male relatives are kept here as well as the bones of the female relatives, but separately from each other.

The third burial finally occurs in a very ceremonial way, when the bones from the various maw phew are transferred into the common grave of the whole sib maw bah.

[436] A Schematic Representation of the Transfer of the Bones of a Sib:

1. Burial: Cremation: maw shying — Cremation: maw shying — Cremation: maw shying — Cremation: maw shying — Cremation: maw shying
(Bones of a single dead person, male or female) (single grave)
2. Burial: maw phew — maw phew
(Bones of men and women separated) Family grave)
3. Burial: maw bah
(Bones of the men and women separated) (Sib grave)
a) First Burial (maw shying)

As soon as the cremation is over, the participants form a procession and bring the ashes or bones to the maw shying. One man hurries ahead, strewing leaves (ding shit=hot wood) alternately with grains of rice on the
764 road. Then the woman follows who carries the
292 bones. She is festively dressed and has a kind of scarf around her shoulders such as the Catholic priests wear for carrying the monstrance. In a village south of Lamin I saw

764
[292] on such an occasion a scarf which was decorated with gold edges and gold fringes. Whereas the relatives following next may walk and speak as they choose, the woman dressed in the scarf, who is carrying the bones wrapped in white cloth with respect against her breast, is required to be silent, not to vary to the right or to the left, but to walk in a straight line to the maw shing [sic] as far as this is possible.

764
782 Having arrived at the place, a rooster is first sacrificed, which one calls the "guide to heaven" (u 'iar krad lynti), because he is supposed to accompany the spirit of the deceased into the other world. Afterwards three loaves of rice bread, an egg and brandy are sacrificed by the sacrificial priest (nongknia), so that the ashes may rest well here. The bones are placed in an earthern pot after they are well washed, and the jar is bound with a white linen cloth. The three loaves of bread along with the egg and the left foot of the previously sacrificed rooster are placed beside the jar in the prepared grave (if one can call the hole that) and the grave is closed with a stone. Betel nuts, pepper leaves, and lime are placed on top.

b) Second Burial (maw phew)

After a while the bones in the separate maw shying are collected, but the bones of the men and the bones of the women are kept and carried separately. In a manner similar to the above the transfer into the maw phew occurs. There the bones are laid separated in the prepared places, and the usual sacrifices of the rooster, the kpu, and the liquor are offered.

[The village chief in his sacrificial coat and ornaments]

The spectators now go to the side, the S'iem and the Rangbahs 796
come down to the place of sacrifice, while the Soh Blei receives the 782
utensils and the sacrificial gifts and spreads them out in order on the ground. Then he takes the rooster in both hands and calls on the god Shillong with these words; "O god Shillong, thou who hast been seated since time immemorial! (ko Blei Shillong kumba la buh u long shwa!)" With a deep bow he then offers the sacrifice five times. Rooster and goat are sprinkled with water, rice, and the flour from kpu and rynsi, and are then beheaded. Then the examination of the [987]
entrails (dykhot) takes place in order to see if the sacrifice was acceptable. The way of doing that will be given below.

After the end of the sacrifice the Soh Blei and a flute player lead [535]
the sword dance; after them the S'iem and the other dancers follow [534]
in turn. Various drums are beaten alternately and flutes are played through the whole night. When night falls the goats of the S'iem and those of the various districts of the kingdom of Nongkrem are brought for the sacrifice of the next day.

The day following the great market is called ka sngi Lyngka. It 796
is the center point and climax of the whole ceremony. From early 782
in the morning the crowds pour in from all sides of the Khasi Mountains. 534

Early in the morning an unmarried girl of the royal lineage (ka 535
S'iem ba dang khynraw) dances in the house of the S'iem sād before the rishot Blei. Usually a granddaughter or nearer relative of the S'iem sād is chosen for this. Two men then take the girl in their arms and carry her with a rocking motion to the large open place in front of the iing sād.

Then the great folk dance begins. In the middle of the place musicians squat on the ground and play the drums and flutes, and strike the cymbals. The music is quite without art, only a repetition of the same monotonous tones.

The women dancers move in a rather narrow circle around the musicians. Only the unmarried girls dance. The clothes they wear 292 ●
for it are very rich and frequently very valuable. Fine cloths, usually of red, yellow, or blue silk are draped over their bodies; the upper body and arms are covered by a satin jacket. Their hair is bound to- [302]
gether in a bun behind their heads; a string hangs /facing p. 896. 301
Fig. 5.[1] Khasi Men Dancers in front of the iing sād. Phot. P. Frum. Stegmiller, S. D. S. Fig. 6. Sword Dance of the Khasi. Fig. 7. S'iem sād and S'iem of Nongkrem. / /897/ down from the bun which usually ends in three tassels. The head is covered by a golden or silver crown of fine chased work, which is topped by a bunch of feathers or a bunch of artificial flowers. Around their necks they wear chains of gold or

[1] [For illustrations, see category 116, p.116 --- Analy:]

301 silver and several in various sizes made of real corals. Their ear lobes are decorated with heavy earrings; shoes and stockings are not worn. Around their arms and wrists are massive silver rings or hoops, the latter being quite wide and in the same shape as cuffs. Fig. 10 shows the ornaments in detail. The very grand [293] women dancers usually have a servant carrying an opened umbrella behind them.

535 The Khasi dance does not have the exciting and lively motions that are characteristic of our dances. Each woman dancer with her arms hanging down at her sides and her eyes cast modestly to the ground could be considered a model of modesty. Each completes her motions alone and completely independent of the others. She continuously makes a circle around the musicians, moving sideways, forwards, or backwards. At the same time the feet are kept close together and are moved seemingly so little that the motion is scarcely visible. When a woman dancer is tired she withdraws in order to rest a bit, and then enters again into the rows of the other dancers.

Figs. 8 and 9 illustrate the above description of the Khasi woman dancers. Fig. 8 shows the girls in the dance in front of the ïing sād, of which only the front part may be seen above in the picture on the right.

535 292 At a proper distance from the girls the men dance in a wider circle around the place. They also have special clothing. Over the usual white cloth that covers the lower part of the body they wear a shirt, and over it a silk coat embroidered with many colors without sleeves which ends in a long fringe. Cf. Fig. 9 for this. A tail or [301] train of animal hair hangs down over the back. Costly coral chains decorate the breast. A bunch of artificial flowers (thuia) about 18 inches long or of black and white rooster feathers is placed in the silk turban, while the right hand holds a bunch of goat hair. The modern shoes and stockings which are now worn by many go very badly with the otherwise pretty costume.

535 The motions of the men are more lively than those of the dancing girls, but still quite relaxed. In a dawdling manner they hop from one leg to another in a childish way, without lifting their legs very much. In this way they move forward, describing a circle; at the same time they wave the bunch of hair around in the air. From time to time they stop and as a group make a bow towards the middle of the circle with a loud rejoicing shout of pleasure, while they swing the bunch of hair downwards at the same time (cf. Fig. 5).[7]

291 small kilt), and a cap which is peaked in front and which comes down well over the ears, called (*ka tupia skkor*) ear cap. The dress of the Khasi females is somewhat different from that of the Synteng, the former wears a striped cloth tied round the waist, hanging down to the knees, and another cloth, with a fringed border, knotted on both the shoulders to cover the bust and a narrow cloth, called *ka jympien*, to serve the purpose of under-clothing. A cloth knotted in front is also worn like a cloak over shoulders. The Synteng woman wears a cloth smoothed round the body fastened above the bust and drooping down to the ankles. Another cloth is thrown over the shoulders, and crossed in front. Both Khasi and Synteng women wear a cloth tied over the head, called *ka tap mokkhlieh*. Up-to-date Khasi males wear knicker-
292 bockers, stockings, and boots, and females chemises. On festive occasions, both Khasis and Syntengs, males and females, wear expensive silks, with earrings of gold or silver. There is a special dancing-dress of
301 elaborate pattern: The women at festivals wear a circlet of silver with a spear-head ornament behind, rising 4 or 5 inches from the back of the head. Large coral beads are much valued, and necklaces of alternate beads of coral and gold, and sometimes of coral alone, are worn by the chiefs and their principal followers. Such necklaces are worn by
262 women also on *gala* occasions. The staple diet of both Khasis and Syntengs is rice and dried fish. They are, however, fond of all kinds of meat, especially pork. Some of the Syntengs abstain from beef,
[171] owing no doubt to Hindu influences. Neither Khasis nor Syntengs eat dog, which is partaken of with zest by the Naga and the Garo tribes,—this is owing to the dog being considered by the Khasis to be the friend of man. Neither Khasis nor Syntengs use milk, the latter being thought by them to be an excrement. Neither Khasis nor Syntengs
411 tattoo. The weapons of both Khasis and Syntengs are bows and arrows, swords and shields. The national game of the Khasis is archery, regarding which a detailed description will be found in paragraph 10.

The people live in regular villages on fixed sites which have not
361 changed for generations,—and they appear to be much attached to these sites, where, as a rule, the family tombs are standing. The houses are
342 built in the shape of a shell, the houses being divided into three compartments,—the *Shyngkup*, or porch, where odds and ends, and sometimes fowls, are kept; *neugpei*, or centre room, which is used for cooking and sitting in; and *rumpei*, or inner room, where the people sleep. The houses are low, with grass roofs reaching nearly to the ground, the beams are of hewn timber, the walls are of either planks roughly hewn or of reeds or split bamboos plastered with clay. The Khasis' houses generally have boarded floors raised some feet from the ground level,

1:Gurdon E-4,5 (no date) 1907 AR7 Khasi AR7

I have seen
211 women at Nongpoiti wearing quivers of leaves. It was explained to me that these were worn to keep off the leeches. The Khasi women might almost be said to be ceremonialy clothed—they wear the cloak in such a way as to hide entirely the graceful contours of the figure. The women are infinitely more decently clothed than Bengali coolie women, for instance; but their dress cannot be described as becoming or graceful, although they show taste as regards the blending of colours in their different garments.

The dress of the Syntengs women is a little different. With them the *juia khrymong* takes the place of the Khasi *jaiaseu*, and is worn by them in the following manner:—One of the two ends is passed under one armpit and its two corners are knotted on the opposite shoulder. The other end is then wound round the body and fastened at the waist, from which it hangs half way down the calf. Over this they wear a sort of apron, generally of mugo silk. They have the cloak and the head-wrapper just the same as the Khasi women. The Syntengs striped cloth may be observed in the picture of the Syntengs girl in the plate. Khasi women on festive occasions, such as
[212] the annual Nongkrem puja, do not cover the head. The hair is then decked with jewellery or with flowers; but on all ordinary occasions Khasi women cover the head. Wild women, however, often have their heads uncovered.

Modern Dress.—The up-to-date Khasi male wears knickerbockers made by a tailor, stockings, and boots; also a tailor-made coat and waistcoat, a collar without a tie, and a cloth peaked cap. The young lady of fashion dons a chemise, also often a short coat of cloth or velvet, stockings, and smart shoes. Of course she wears the *jaiaseu* and cloak, but occasionally she may be seen without the latter when the weather is warm. It
[213] should be mentioned that the Khasi males are seldom seen
[214] without a haversack in which betel-nut, lime, and other odds and ends are kept; and the female has her purse, which, however, is not visible, being concealed within the folds of her lower garment. The haversack of the men is of cloth in the high plateau and in the Bhoi country, but it is of knitted fibre in the Wild country. The Syntengs have a cloth bag, which they call *ka wasa*.

1:Gurdon E-4,5 (no date) 1907 AR7 Khasi AR7

blackened with the smoke of years, upon which are spread the faggots of resinous fir-wood used for kindling the fire. Above this again is a wooden framework fixed on to the beams of the house, upon which all sorts of odds and ends are kept. Around the fire are to be seen small wooden stools, upon which the members of the household sit. Up-to-date Khasis have cane chairs, but the women of the family, true to the conservative instincts of the sex, prefer the humble stool to sit upon. Well-to-do Khasis nowadays have, in addition to the ordinary cooking vessels made of iron and earthenware, a number of brass utensils. The writer has seen in a Khasi house in Mawkhar brass drinking vessels of the pattern used in Orissa, of the description used in Manipur, and of the kind which is in vogue in Sylhet. The ordinary cultivator, however, uses a waterpot made from a gourd hollowed out for keeping water and liquor in, and drinks from a bamboo cylinder. Plates, or more properly speaking dishes, are of several kinds in the houses of the rich, the two larger ones being styled *ka pliang kynthei* (female) and *ka pliang shyrong* (male). Needless to say, the first mentioned is a larger utensil than the latter. The ordinary waterpots, *u khiew pliang kynthei* and *u khiew pliang shyrong*, are made of brass, the former being a size larger and having a wider mouth than the latter. The pot for cooking vegetables is made of iron. Another utensil is made of earthenware; this is the ordinary cooking pot used in the houses of the poor. Brass spoons of different sizes are used for stirring the contents of the different cooking utensils, also a wooden spoon.

In the sleeping-rooms of the well-to-do there are wooden beds with mattresses and sheets and pillows, clothes being hung upon clothes-racks, which in one house visited were of the same pattern as the English "towel horse." The ordinary cultivator and his wife sleep on mats made of plaited bamboo, which are spread on the bare boards of the house. There are various kinds of mats to be met with in the Khasi houses made of plaited cane, of a kind of reed, and of plaited bamboo. The best kind of mat is prepared from cane. In all Khasi houses are to be seen *ki kwap*, or rain shields, of different sizes and sometimes of somewhat different shapes. The large

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

shield of Cherrapunji is used as a protection from rain. 293
Those of Maharam and Mawiang are each of a peculiar pattern. 352
Smaller shields are used as protections from the sun or merely for show, and there are specially small sizes for children. Then there are the different kinds of basket (*ki Ikok*) which are carried on the back, along across the forehead 415 482
by a cane head-strap. These, again, are of different sizes. They are, however, always of the same conical shape, being round and broad-mouthed at the top and gradually tapering to a point at the bottom. A bamboo cover is used to protect the contents of the basket from rain. There is a special kind of basket made of cane or bamboo with a cover, which is used for carrying articles on a journey. These baskets, again, are of different sizes, the largest and best that the writer has seen being manufactured at Ramhrai, in the south-western portion of the hills. Paddy is husked in a wooden mortar by means of a heavy 412
wooden pestle. These are to be seen all over the hills. The 415
work of husking paddy is performed by the women. A 256
bamboo sieve is sometimes used for sifting the husked rice, a winnowing fan being applied to separate the husk. The cleaned rice is exposed to the sun in a bamboo tray. Paddy is stored in a separate store-house in large circular bamboo receptacles. These hold sometimes as much as 30 maunds* of grain. Large baskets are also used for keeping paddy in. In 415
every Khasi house is to be found the net bag which is made 825
out of pineapple fibre, or of a *stein*, the *Assamese riha* 436
(*Boehmeria nivea*). These bags are of two sizes, the larger one for keeping cowries in, the cowrie in former days having been used instead of current coin in these hills, the smaller for the ever necessary betel-nut. *Pân* leaves are kept in a bamboo tube, and tobacco leaves in a smaller one. Lime, for eating with betel-nut, is kept in a metal box, sometimes of silver, which is made in two separate parts held together by a chain. The box is called *ka shanaw*, and 415
is used all over the hills. This box is also used for 987
divination purposes, one end of it being held in the hand, and the other, by means of the chain, being allowed to swing

* One maund is 82 lbs.

109

must also be sought out and hired at the markets. 443

3. The Customs of the Market

a) The Preparation for Market. The sellers of both sexes normally carry their wares to the market themselves. They form smaller or larger groups and travel together. The wares are carried on their backs. The burden is packed according to its bulk or content. Larger objects, such as bamboo poles, beams, sugar cane, grass, and mats are carried without any covering by means of a forehead band plaited of reed grass (u star). Smaller items, such as salt or potatoes, are packed in sacks; others such as betel nuts, pepper leaves, fruit, vegetables, etc. are carried in baskets made of bamboo. The baskets are either pointed baskets which are round at the top or square baskets, which narrow to a point at the bottom but still are four feet long in size. The latter baskets are usually made with a cover, which, like the basket itself, is plaited and almost waterproof, so that flour or salt can be transported in them even during the rainy season. A round or oval object shaped like a shield, which in case of need is used as an umbrella (ka trap) and which is plaited out of bamboo, is inserted between the back and the burden (jingkit). On the one hand this object has the purpose of ameliorating the pressure of the burden and on the other hand it is pulled out in rainy weather to serve as an umbrella when it is held up against the rain by hand. [244] 443 482 438 285 443 [243]

With regard to the weight which the Khasi carry to market, the men carry about 100 and more pounds while the women seldom 482

301 silver and several in various sizes made of real corals. Their ear lobes are decorated with heavy earrings; shoes and stockings are not worn. Around their arms and wrists are massive silver rings or hoops, the latter being quite wide and in the same shape as cuffs. Fig. 10 shows the ornaments in detail. The very grand women dancers usually have a servant carrying an opened umbrella behind them.

[293]

535 The Khasi dance does not have the exciting and lively motions that are characteristic of our dances. Each woman dancer with her arms hanging down at her sides and her eyes cast modestly to the ground could be considered a model of modesty. Each completes her motions alone and completely independent of the others. She continuously makes a circle around the musicians, moving sideways, forwards, or backwards. At the same time the feet are kept close together and are moved seemingly so little that the motion is scarcely visible. When a woman dancer is tired she withdraws in order to rest a bit, and then enters again into the rows of the other dancers.

Figs. 8 and 9 illustrate the above description of the Khasi woman dancers. Fig. 8 shows the girls in the dance in front of the ling lad, of which only the front part may be seen above in the picture on the right.

535 292 As a proper distance from the girls the men dance in a wider circle around the place. They also have special clothing. Over the usual white cloth that covers the lower part of the body they wear a shirt, and over it a silk coat embroidered with many colors without sleeves which ends in a long fringe. Cf. Fig. 9 for this. A tail or [301] tuft of animal hair hangs down over the back. Costly coral chains decorate the breast. A bunch of artificial flowers (thala) about 18 inches long or of black and white rooster feathers is placed in the silk turban, while the right hand holds a bunch of goat hair. The modern shoes and stockings which are now worn by many go very badly with the otherwise pretty costume.

535 The motions of the men are more lively than those of the dancing girls, but still quite reserved. In a dawdling manner they hop from one leg to another in a childish way, without lifting their legs very much. In this way they move forward, describing a circle; at the same time they wave the bunch of hair around in the air. From time to time they stop and as a group make a bow towards the middle of the circle with a loud rejoicing shout of pleasure, while they swing the bunch of hair downwards at the same time (cf. Fig. 8).[1]

1 [see [illegible] pp. [illegible] --- [illegible]]

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chikas. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stoughton 1954a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

clothing, operate the large Khasi business establishments in Shillong, and provide all civic and religious leadership. Women care for children and for the home, do the marketing, and sell dried fish, betel nut, lime, fruits, and rice breads at markets. Other tasks can be performed by either sex. **Land tenure.** Land was formerly divided into sib land and public domain. Sib land was corporately held in perpetuity, and was inalienable except by the unanimous consent of all members of the sib. The public domain was subject to usufructuary right by anyone who kept the land regularly under habitation or cultivation, with a lapse of no more than three years. Most villages grew up on public domain, and then reckoned all land inhabited or under cultivation by a village member as village land. Forests were public, except for sacred groves possessed by villages or lineage groups, and everyone was free to gather branches for fuel. Wastelands and streams were also public. By now, most public domain and village land, together with its forest cover, has been pre-empted as private property and is being rented and sold as such. Sib lands remain intact, unless the sibs agree to rent, lease, or sell. [Cf. Cantlie 1934.]

462 294 343 622 423 [178]

KIN GROUPS. **Descent.** Descent is matrilineal, and the Khasi is a member exclusively of his own matrilineage from birth to death. Adoption, which is very rare, is only within the matrilineage. **Kin groups.** The maximal matrilineage is the sib; this is a named, widely dispersed, strictly exogamous, lineage group, which claims but cannot trace its origin from a single ancestress. Sibs used to meet as corporate groups from time to time. Some sibs are linked with others in large amorphous groups that are unnamed and are defined solely by exogamy. Such a group is composed of two or more sibs, the ancestresses of which are claimed to have been either real sisters or dear friends who out of affection declared that thenceforth their descendants would be as consanguineals. The origin and function of sib-linkage is now unknown, and today the members of a sib will often disagree on whether or not their sib is linked with another. • The minimal matrilineage is the local descent group, or *ing*. This is the largest kin group that normally rallies at life crises. It is said that the *ing* formerly spanned six generations; today, it encompasses only four. If an *ing* grows to more than four generations in a single village, it segments. New houses are located at some distance from the old and the *ing* soon forgets exactly how to trace genealogical connection, except for which segment descended from a youngest sister. The term *ing* may also be applied to an extended family, an elementary family, and a house. The elementary family is the basic domestic unit in Khasi society. In any village there are likely to be one or two households which stand as sole local representatives of the lineage of the female household head. Such a household is known as an

Weaving and Spinning ...	3	1	284
Rearing of cocoons, etc. ...	1	1	283
Rearing of lac	1	1	231
Others	3	1	

Blacksmithy and making of baskets, cane products, etc., out of cane and bamboo, are a traditional occupation. Weaving and spinning of cotton, rearing of endi cocoon and weaving of endi, etc., are in vogue only in the Bhoi area and the areas adjoining Kamrup and North Cachar and Mikir Hills districts. Lac rearing is found in the northern portion of the district, *i.e.*, Nongpoh area. 184

Except cane and bamboo works and blacksmithy other industries are practised in a very limited scale. There is thus a lot of scope for introducing cottage industries in the district.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

JEWELLERY.

301 The Khasis, as a people, may be said to be fond of jewellery.
326 The women are specially partial to gold and coral bead necklaces. The beads are round and large, and are usually unornamented with filigree or other work. The coral is imported from
[439] Calcutta. The gold bead is not solid, but a hollow sphere filled with lac. These necklaces are worn by men as well as women, especially on gala occasions. Some of the necklaces are comparatively valuable, e.g. that in the possession of the Mylliem Siem family. The gold and coral beads are prepared locally by Khasi as well as by foreign goldsmiths. The latter derive considerable profits from the trade. The Assam Census Report of 1901 shows 133 goldsmiths in the Khasi and Jaintia Hills district, but does not distinguish between Khasis and foreigners. There are Khasi goldsmiths to be found in Mawkhar, Cherrapunji, Mawlai, and other villages. Sylheti goldsmiths are, however, more largely employed than Khasi in Mawsynram and certain other places on the south side of the hills. In Mr. Hemniker's monograph on "gold and silver wares of Assam" it is stated that the goldsmiths of Karimganj in Sylhet make specially for Khasis certain articles of jewellery, such as men's and women's earrings, &c. An article of jewellery which is believed to be peculiar to the Khasis is the silver or gold crown. This crown is worn by the young women at
301 dances, such as the annual Nongkrem dance. An illustration of one will be seen by referring to the plate. These crowns are circlets of silver or gold ornamented with filigree work. There is a peak or, strictly speaking, a spike at the back, called *u'tiew-lasubon*, which stands up some six inches above the crown. There are long ropes or tassels of silver hanging from the crown down the back. Earrings are worn both by men and women. The former affect a pattern peculiar to themselves, viz. large gold pendants of a circular or oval shape. Women wear different patterns of earrings, according to locality. An ornament which I believe is also peculiar to the Khasis is the *rupa-tylli*, or silver collar. This is a broad flat silver collar which is allowed to hang down over the neck in front, and which is secured by a fastening behind.

Silver chains are worn by men as well as by women. The men wear them round the waist like a belt, and the women hang them round their necks, the chains being allowed to depend as low as the waist. Bracelets are worn by women; these are either of gold or of silver. The Lynngam males wear bead necklaces, the beads being sometimes of cornelian gathered from the beds of the local hill streams, and sometimes of glass obtained from the plains markets of Dauara and Moiskhola. The cornelian necklaces are much prized by the Lynngams, and are called by them '*pieng blei*, or gods' necklaces. Like the Garos, the Lynngams wear as many brass earrings as possible, the lobes of the ears of the females being frequently greatly distended by their weight. These earrings are made out of brass wire obtained from the plains markets. The Lynngams wear silver armlets above the elbow and also on the wrists. It is only a man who has given a great feast who can wear silver armlets above the elbows. These armlets are taken off as a sign of mourning, but never on ordinary occasions. The Lynngams do not wear Khasi jewellery, but jewellery of a pattern to be seen in the Garo Hills. A distinctive feature of the Lynngam women is the very large number of blue bead necklaces they wear. They put on such a large number as to give them almost the appearance of wearing horse collars. These beads are obtained from the plains markets, and are of glass. Further detailed information regarding this subject can be obtained from Mr. Henniker's monograph, which contains a good plate illustrating the different articles of jewellery.

WEAPONS.

The weapons of the Khasis are swords, spears, bows and arrows, and a circular shield which was used formerly for purposes of defence. The swords are usually of wrought iron, occasionally of steel, and are forged in the local smithies. The Khasi sword is of considerable length, and possesses the peculiarity of not having a handle of different material from that which is used for the blade. In the Khasi sword the handle is never made of wood or bone, or

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

535 be a successful era in store for the people of the State. The
776 goddess on this occasion may be regarded as a Khasi Demeter,
796 although no mysteries form part of her services as at the
789 Grecian Eleusis. The Nongkrem ceremony and dance (now
782 held at Smit) take place in the late spring, generally in the month of May. A lucky day having been fixed, the Siem sends a ring of cane (*kyrwoh*) by way of a summons to the people of every village in the State, at the same time informing them of the date of the puja, and requesting them to attend with their offerings, consisting of goats and different articles of food. In the meantime various pujas have been taking place in the house of *Ka Siem Sad*, the Siem priestess, which it would be tedious to describe in detail. The more interesting points only will be mentioned. A fortnight before the puja and dance at Smit the *soh-blei*, or high priest, pours out libations of liquor in the *kyram-blang*, or place where the sacrificial goats are kept, and in front of the great post (of *dieng sning*, or Khasi oak), in the house of the Siem priestess. Dancing then takes place in front of the post. Later on the Siem, with the high priest and other attendant priests, walks with extremely slow gait to a small hill where a stone altar has been prepared, and sacrifices a cock in honour of *u'lei Shillong*, or the god of the Shillong Peak. A silver dish with powdered rice, liquor in a gourd (*ka'iad um*), betel-nut, and some leaves of the Khasi oak (*dieng sning*), are also necessary adjuncts of the puja. A goat is then sacrificed, and the sacrifice is followed by a dance of twenty-two men armed with swords and shields and chowries (fly-flaps). Having danced before the altar, the party returns to the house of the Siem priestess and executes another dance in the great courtyard. The Siem and certain selected persons dance in front of the *rishot blei*, or holy post
[261] of Khasi oak inside the house of the Siem priestess, the dancers being entertained with dried fish and ginger. Then follows the great dance of girls and men in front of her
782 house. The girls dance in the centre, taking such tiny
796 steps, that the lifting of their feet from the ground is hardly
535 perceptible, the arms held down to the sides and the eyes
301 demurely downcast. It is on this occasion that they wear the
302 peculiar silver (and sometimes gold) crowns illustrated in the

301 plate. The hair is worn tied in a knot behind the head, but with
302 a long tail hanging down the back. Rich silk cloths are worn
535 by the girls, who present the appearance of being, if any-
[292] thing, over-clothed, or, as Yule aptly puts it, of "perfect
796 parallelograms." They wear a profusion of gold and coral
782 bead necklaces, silver and gold chains, bracelets, ear-rings of gold, and any other jewellery they can lay hands on. Not only is the whole of the family jewelery requisitioned by the fair *débutante* (it is only the unmarried girls who dance), but she borrows from her friends. The men dance round the outside of the circle, waving fly-flaps and prancing (often nowadays wear-
[534] ing huge boots) with ungainly strides. The music necessary for the dance consists of *tangmuri* (pipes), drums, and cymbals.
[292] This is *ka shad kynthei*, or the dance of the women. Then there is *ka shad mastieh*, or the dance of the men, who are gaily dressed, wearing plumes of black and white cock's feathers (*u thuiyah*) and hold swords and shields. After gyrating for some time, two men at a time rapidly approach one another and clash their swords together in mock combat. They then retire, and, after again revolving for a period, repeat the process; then other couples follow and take their place. This goes on until the dancers get tired or are told to stop.

535 The above description may be taken as applicable to all
764 the Khasi dances. Dancing forms part of the ceremony of placing the ashes in the sepulchre of the clan. Dancing also forms a part of certain ceremonies performed at markets for the prosperity of the State and for the good of trade.

535 When I was at Mawaynram, at the time of the appointment of a Sieun, I witnessed a very pretty dance called *ka shad lymmoh*, performed by men who held the leafy branches of trees in their hands. This is most effective. Then
[301] followed a dance of some forty young girls, very well dressed, covered with the usual gold and coral beads and silver chains, and wearing the silver crown, or *pansngiat*. The young women danced with great spirit, and with an absence of all shyness, but still with the greatest decorum. Many of the women, spectators as well as dancers, were observed to be without the usual *tap noh khlih*, or head-cloth, the absence of which is always a sign amongst the Khasi women of merry-making. There were

considering. Some of the leading characteristics of the Lyngams will now be detailed. The Lyngams are by complexion swarthy, with features of Mongolian type. The men are of middle height and the women remarkably short, both sexes being not nearly so robust as the Khasis, a result due probably to climatic influences, for the Lyngams live in fever-haunted jungles. The men have very little hair about the face, although a scanty moustache is sometimes seen, the hairs in the centre being carefully plucked out, the result being two tufts on either side. Beards are never seen. The women are ill-favoured, and wear very little clothing. The men wear the sleeveless coat of the Khasi and Mikir pattern, called *phong-marong*, which is made of cotton dyed red, blue, and white. This custom may have been borrowed from the Khasis. They do not grow their own cotton, but obtain it from the plains. They make their own dyes, *changlong* (red) and *kur sai-iong* (black). A cotton cloth, barely enough for purposes of decency, is tied between the legs, the ends being allowed to hang down in front and behind. Sometimes an apron is worn in front. At the present day the men wear knitted woollen caps, generally black or red, of the Nongstoin pattern (a sort of fisherman's cap), but the elderly men and head-men wear turbans. The females wear a cotton cloth about eighteen inches broad round the loins, sometimes striped red and blue, but more often only dark blue. A blue or red cloth is thrown loosely across the shoulders by unmarried girls, but married women only wear the waist-cloth, like the Garos. A cloth is tied round the head by married women, sometimes, Garo fashion. The women wear quantities of blue beads as necklaces, like their Garo sisters. They obtain the beads from the Garo markets at the foot of the hills. Brass ear-rings are worn by both sexes; the women, like the Garos, load their ears to such an extent with brass rings as to distend the holes greatly. Silver armlets are worn by the head-men only, or by those who possess the means to give a great feast to the villagers. This is the custom of the Garo *nokmas*, or head-men. Both sexes wear bracelets. The men also wear necklaces of beads. The rich wear necklaces of cornelian and another stone which is thought by the Lyngams to be valuable. A necklace of such stones is called *u'piong bisi* (god's necklace).

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

301 This stone is apparently some rough gum which may be picked up by the Lyngams in the river beds. A rich man amongst
556 them, however, is one who possesses a number of metal gongs,
534 which they call *wiang*. For these they pay very high prices.
436 Rs. 100 being quite a moderate sum for one of them. Being curious to see one of these gongs, I asked a *sirdar*, or head-man, to show me one. He replied that he would do so, but it would take time, as he always buried his gongs in the jungle for fear of thieves. Next morning
[531] he brought me a gong of bell metal, with carvings of animals engraved thereon. The gong when struck gave out a rich deep note like that of Burmese or Thibetan gongs. These gongs have a regular currency in this part of the hills, and represent to the Lyngams "Bank of England" notes. It would be interesting to try to ascertain what is their history, for no one in the Lyngam country makes them in these days. Is it possible that the Garos brought them with them when
534 they migrated from Thibet? The gongs are well known in the
622 Garo Hills, and I hear that when a *nokma*, or head-man, there
778 dies his corpse is laid out upon them. They thus possess also an element of sanctity, besides being valuable for what they will fetch to the Garos or Lyngams. We may hope to hear more about them in Captain Playfair's account of the Garos.

304 The Lyngams do not tattoo. Their weapons are the large-
411 headed Garo spear, the dao, and the shield. They do not usually
243 carry bows and arrows, although there are some who possess them. They are by occupation cultivators. They sow two kinds of hill rice, red and white, on the hill-sides. They have no wet paddy cultivation, and they do not cultivate in terraces like the Nagas. They burn the jungle about February, after cutting down some of the trees and clearing away some of the debris, and then sow the paddy broadcast, without cultivating the ground in any way. They also cultivate millet and Job's-tears in the same way. With the paddy *thillies* are sown the
241 next year. The egg plant, arum, ginger, turmeric, and sweet
231 potatoes of several varieties are grown by them in a similar
759 manner. Those that rear the lac-insect plant *lendoo* trees (Hindi *ankul dol*) in the forest clearings, and rear the insect thereon. Some of these people, however, are prohibited by a

The spectators now go to the side, the S'iem and the Rangbahs come down to the place of sacrifice, while the Soh Blei receives the utensils and the sacrificial gifts and spreads them out in order on the ground. Then he takes the rooster in both hands and calls on the god Shillong with these words: "O god Shillong, thou who hast been seated since time immemorial! (ho Blei Shillong kumba la buh u long shwa!)" With a deep bow he then offers the sacrifice five times. Rooster and goat are sprinkled with water, rice, and the flour from kpu and rymi, and are then beheaded. Then the examination of the entrails (dylhet) takes place in order to see if the sacrifice was acceptable. The way of doing that will be given below. 796 782 [787]

After the end of the sacrifice the Soh Blei and a flute player lead the sword dance; after them the S'iem and the other dancers follow in turn. Various drums are beaten alternately and flutes are played through the whole night. When night falls the goats of the S'iem and those of the various districts of the kingdom of Nongkrem are brought for the sacrifice of the next day. [539] [534]

The day following the great market is called ka ngi Lyngka. It is the center point and climax of the whole ceremony. From early in the morning the crowds pour in from all sides of the Khasi Mountains. 796 782 534 535

Early in the morning an unmarried girl of the royal lineage (ka S'iem ha dang khynraw) dances in the house of the S'iem sûl before the rishot Blei. Usually a granddaughter or nearer relative of the S'iem sûl is chosen for this. Two men then take the girl in their arms and carry her with a rocking motion to the large open place in front of the ling sûl.

Then the great folk dance begins. In the middle of the place musicians squat on the ground and play the drums and flutes, and strike the cymbals. The music is quite without art, only a repetition of the same monotonous tones.

The women dancers move in a rather narrow circle around the musicians. Only the unmarried girls dance. The clothes they wear for it are very rich and frequently very valuable. Fine cloths, usually of red, yellow, or blue silk are draped over their bodies; the upper body and arms are covered by a satin jacket. Their hair is bound together in a bun behind their heads; a string hangs /facing p. 896. Fig. 5: Khasi Men Dancers in front of the ling sûl. Phot. P. From. Stegmiller, S. D. S. Fig. 6. Sword Dance of the Khasi. Fig. 7. S'iem sûl and S'iem of Nongkrem. / /897/ down from the bun which usually ends in three tassels. The head is covered by a golden or silver crown of fine chased work, which is topped by a bunch of feathers or a bunch of artificial flowers. Around their necks they wear chains of gold or 292 [302] 301

[For illustrations, see category 16, p.6 --- Analy:]

301 silver and several in various sizes made of real corals. Their ear lobes are decorated with heavy earrings; shoes and stockings are not worn. Around their arms and wrists are massive silver rings or hoops, the latter being quite wide and in the same shape as cuffs. Fig. 40 shows the ornaments in detail. The very grand [293] women dancers usually have a servant carrying an opened umbrella behind them.

535 The Khasi dance does not have the exciting and lively motions that are characteristic of our dances. Each woman dancer with her arms hanging down at her sides and her eyes cast modestly to the ground could be considered a model of modesty. Each completes her motions alone and completely independent of the others. She continuously makes a circle around the musicians, moving sideways, forwards, or backwards. At the same time the feet are kept close together and are moved seemingly so little that the motion is scarcely visible. When a woman dancer is tired she withdraws in order to rest a bit, and then enters again into the rows of the other dancers.

Figs. 8 and 9 illustrate the above description of the Khasi woman dancers. Fig. 8 shows the girls in the dance in front of the ling sad, of which only the front part may be seen above in the picture on the right.

535 292 At a proper distance from the girls the men dance in a wider circle around the place. They also have special clothing. Over the usual white cloth that covers the lower part of the body they wear a shirt, and over it a silk coat embroidered with many colors without sleeves which ends in a long fringe. Cf. Fig. 9 for this. A tail or [301] tuft of animal hair hangs down over the back. Costly coral chains decorate the breast. A bunch of artificial flowers (thuia) about 18 inches long or of black and white rooster feathers is placed in the silk turban, while the right hand holds a bunch of goat hair. The modern shoes and stockings which are now worn by many go very badly with the otherwise pretty costume.

535 The motions of the men are more lively than those of the dancing girls, but still quite relaxed. In a dawdling manner they hop from one leg to another in a childish way, without lifting their legs very much. In this way they move forward, describing a circle; at the same time they wave the bunch of hair around in the air. From time to time they stop and as a group make a bow towards the middle of the circle with a loud rejoicing shout of pleasure, while they swing the bunch of hair downwards at the same time (cf. Fig. 5).[7]

[72] division of the forest and of the clans. The little basket is attached to a post in the hut, the special division of the clan-family are supposed to have their dwelling there; two hazelnut twigs fastened underneath symbolize their power. The good bottles are used as containers for the sacrificial drink of rice liquor. (6)

6. Cf. Die Bongleweis-Puja, /The Bongleweis Puja/, loc cit.

[72] As treasures, which are handed down from generation to generation, [Ia] are considered the rich ornaments of gold and silver, the heavy chains of coral, and the silk scarves, which are worn by the women at dancing ceremonies.

Also those things which the family hute contain in the way of furnishings and utensils, such as baskets, mats, lances, shields, arrows and bows, and large pots for cooking and for water, earthen containers and bone plates are considered common property of the family.

[73] /1.10/ The clan mother at the time has the entire property in her hands, due to the legal and sole guardian and manager of the property. Nothing can be lost even without her permission. No part of either the movable or immovable family possessions may be sold [74] without her agreement. For the execution of the proper legal deed, as due to often ignorant of writing, she must place her fingerprint. Nothing may even be given away: that would be an insult to the clan divinity since that would not mean increasing and lessening their property but giving it away as being of no value. As a punishment for that the clan /women/ would also lose to other possessions and then live in poverty and disgrace. The individual members of the clan could sometimes be recruited for work for other clan-families as a kind of slave (mewa). But they may not be taken up in their society as they do not belong to that clan and the clan gods of that family would not permit it. Therefore if, for example, a clan-family has rice fields which they do not cultivate and would gladly give to poorer relatives, they must at least receive the smallest rice as a charge for it. This consists usually of a good bottle of rice liquor, which has the value of about 70 pfennigs to hence the household divination.

Before the clan mother gives her permission for the sale of common property, she listens to the advice of the other members of the clan. Actually according to the old tribal custom things should be so little sold as given away. It is said that in ages past the original ancestors, when the individual clans separated in division, apportioned out this their needs of field and wood, and these are supposed [75] to have their unsalable clan property (sangiin). To let it get out of one's possession would therefore be insulting the gods. However, that

Sr Gordon G-3 (no date) 1904 AR? Khasi AR?

291 small kilt), and a cap which is peaked in front and which comes down well over the ears, called (in *ngain ribor*) *sur cap*. The dress of the Khasi females is somewhat different from that of the Syntengs, the former wears a striped cloth tied round the waist, hanging down to the knees, and another cloth, with a fringed border, knotted on both the shoulders to cover the bust and a narrow cloth, called *ka jymphen*, to serve the purpose of under-clothing. A cloth knotted in front is also worn like a cloak over shoulders. The Syntengs women wear a cloth wrapped round the body fastened above the bust and dropping down to the ankles. Another cloth is thrown over the shoulders, and crossed in front. Both Khasi and Syntengs women wear a cloth tied over the head, called *ka tap mukkhieh*. Up-to-date Khasi males wear hairbrushes, stockings, and boots, and females chemises. On festive occasions, both Khasis and Syntengs, males and females, wear expensive silks, with earrings of gold or silver. There is a special dancing-dress of elaborate pattern. The women at festivals wear a circlet of silver with a cross-band crossing behind, rising 2 or 3 inches from the back of the head. Large coral beads are much valued, and necklaces of alternate beads of coral and gold, and ornaments of coral alone, are worn by the chiefs and their principal followers. Such necklaces are worn by women also on gala occasions. The staple diet of both Khasis and Syntengs is rice and dried fish. They are, however, fond of all kinds of meat, especially pork. Some of the Syntengs abstain from beef, owing no doubt to Hindu influence. Neither Khasis nor Syntengs eat dog, which is partaken of with zest by the Naga and the Garo tribes,—this is owing to the dog being considered by the Khasis to be the friend of man. Neither Khasis nor Syntengs use milk, the latter being thought by them to be an excrement. Neither Khasis nor Syntengs tattoo. The weapons of both Khasis and Syntengs are bows and arrows, swords and shields. The national game of the Khasis is archery, regarding which a detailed description will be found in paragraph 11.

The people live in regular villages on fixed sites which have not changed for generations,—and they appear to be much attached to these sites, where, as a rule, the family tombs are standing. The houses are [illegible] in number,—the *Shyngiap*, or porch, where wife and male, and sometimes female, are kept; *nongpei*, or outer room, which is used for cooking and sitting in; and *nongpei*, or inner room, where the people sleep. The houses are low, with grass roofs reaching nearly to the ground, the houses are of bare timber, the walls are of either planks roughly hewn or of reeds or split bamboos plastered with clay. The Khasis' houses generally have boarded floors raised some feet from the ground level,

796 182 769 231 The goats were sacrified by his sister's eldest son (Sow-Khynnah) and in charge of respective units at the open courtyard. The priests evoked the ancestors and ancestress and called upon them by name praying 'Oh God and Goddess, I offer this sacrifice as our ancestors did. Bless the Sawa, his family and the people of his state. I shall beseech you again on this day after one year. You create favourable weather by virtue of your power, bring clouds and rains to yield bumper crops and ensure a happy and prosperous life.'

On the last day (Dongkoma), a man of Mawroh clan sacrificed a pig introducing an iron spike in its left armpit. Nine pieces of meat from different parts of the pig's body were again offered to their five ancestors. The Sawa in the presence of his *Zurter* performed the last item of festival by praying to U Shilong, when the Chief of Ryngah clan also followed in the same way for seeking the blessings of their Chief deity.

This brought the ritual to an end performed at the residence of Sawa. The five pieces of goat's and pig's meat offered to their five ancestors, were then handed over to the in-charge of the five units considered as somewhat higher in their State organisation. They distributed them at a suitable place in their unit, making a feast as a sort of public declaration of the completion of their process festival for the year.

DANCING

535 796 (532) Besides the ritual described above, dance with the accompaniment of music formed an important aspect of the festival. A dance known as *nongkhnah* had been arranged for the first, second, third and fifth day. This dance has some interesting features. It has to be performed in pairs. The first pair was constituted by Chief priest and the Chief musician. Second to fifth pair was arranged between the leaders of the right and left of the which Sawa along with an official of an council constituted the sixth pair. The subsequent pairs were formed by any two persons from the gathering. They danced only after having first bowed the Gah Mihar (Mother), that is Sun on the fifth day. This pairing was then not adhered to on completion of the last rite of the festival.

A second type of dance (*Ka nongmaiskit*) was then performed in the courtyard by the musicians as well as by the multicoloured dancers (nongshad) with [illegible] on the afternoon of the third day. The dance was always held in pairs but by musicians, and their dancers, who danced their traditional dress consisting of silk turban (*Jumpong*) decorated with feathers, coloured necklace and (*Jumpong*) silver chains and coral necklaces. Later on they joined the procession, that went to the adjacent hill where after the completion of the ceremony of goat killing, a group dance was performed returning to the residence of Sawa ultimately.

[291] [301]

This dance (*nongmaiskit*) was performed by the Sawa family. It was held early in the morning of the fourth day in the central hall (*Shiem*) and also dressed dancers with gold and silver crown (*pamrgiet*), numerous silver ornaments and different coloured blouse. They dressed and braided the hair into a knot just at the nape. The High Priestess who also danced with the member of the Sawa' family, stood in the middle of the line and chief musician stood at one end. They held each other in hand and danced round the fire-place of the central hall (*Shiem*) in anti-clock-wise direction in accompaniment of music. The people assembled there, gave vent to their feeling in their customary way every time, before they resumed to make it flow back. Similar performance of dance were also held in the courtyard.

[291] [301] [302]

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

140 hills, and if one met them in the plains one would not be able to distinguish them from the ordinary Kachari or Rabha. The nose in the Khasi is somewhat depressed, the nostrils being often large and prominent. The forehead is broad and the
141 space between the eyes is often considerable. The skull may be said to be almost brachy-cephalic, the average cephalic index of 77 Khasi subjects, measured by Col. Waddell and Major Hare, I.M.S., being as high as 77·2 and 77·9, respectively. According to these data the Khasis are more brachy-cephalic than the Aryans, whose measurements appear in Crooke's tables, more brachy-cephalic than the 100 Mundas whose measurements appear in Risley's tables, more brachy-cephalic than the Dravidians, but less brachy-cephalic than the Burmans, whose measurements also appear in Crooke's tables. It would be interesting to compare some head measurements of Khasis with Japanese, but unfortunately the necessary data are not available in the case of the latter people. The Khasi head may be styled sub-brachy-cephalic. Eyes are of medium size,
142 in colour black or brown. In the Jaintia Hills hazel eyes are not uncommon, especially amongst females. Eyelids are somewhat obliquely set, but not so acutely as in the Chinese and some other Mongols. Jaws frequently are prognathous, mouth large, with sometimes rather thick lips. Hair black, straight, and
143 worn long, the hair of people who adopt the old style being caught up in a knot at the back. Some make out the hair short with the exception of a single lock at the back, which is called *u sindiroy* or *u sinbi-' ewbri* (i.e. the grandmother's lock.) The forepart of the head is often shaven. It is quite the exception to see a beard, although the moustache is not infrequently worn. The Lyngngams pull out the hairs of the moustache with the exception of a few hairs on either side of the upper lip.

PHYSICAL AND GENERAL CHARACTERISTICS.

142 The Khasis are usually short in stature, with bodies well
[149] nourished, and the males are extremely muscular. The trunk is long in proportion to the rest of the body, and broad at the waist; calves are very highly developed. The women when

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

women at Nongstoin wearing gaiters of leaves. It was explained to me that these were worn to keep off the leeches. The Khasi women might almost be said to be excessively clothed—they wear the cloak in such a way as to hide entirely the graceful contours of the figure. The women are infinitely more decently clothed than Bengali coolie women, for instance; but their dress cannot be described as becoming or graceful, although they show taste as regards the blending of colours in their different garments.

The dress of the Syntengs women is a little different. With them the *jaio khrywang* takes the place of the Khasi *jaiaseu*, and is worn by them in the following manner:—One of the two ends is passed under one armpit and its two corners are knotted on the opposite shoulder. The other end is then wound round the body and fastened at the waist, from which it hangs half way down the calf. Over this they wear a sort of apron, generally of *muga* silk. They have the cloak and the head-wrapper just the same as the Khasi women. The Syntengs striped cloth may be observed in the picture of the Syntengs girl in the plate. Khasi women on festive occasions, such as the annual Nongkrem puja, do not cover the head. The hair is then decked with jewellery or with flowers; but on all ordinary occasions Khasi women cover the head. *Wár* women, however, often have their heads uncovered.

Modern Dress.—The up-to-date Khasi male wears knickerbockers made by a tailor, stockings, and boots; also a tailor-made coat and waistcoat, a collar without a tie, and a cloth peaked cap. The young lady of fashion dons a chemise, also often a short coat of cloth or velvet, stockings, and smart shoes. Of course she wears the *jaiaseu* and cloak, but occasionally she may be seen without the latter when the weather is warm. It should be mentioned that the Khasi males are seldom seen without a haversack in which betel-nut, lime, and other odds and ends are kept; and the female has her purse, which, however, is not visible, being concealed within the folds of her lower garment. The haversack of the men is of cloth in the high plateau and in the Bhoi country, but it is of knitted fibre in the *Wár* country. The Syntengs have a cloth bag, which they call *ka nawa*.

A. Gordon Z-4, 5 (no date) 1907 AR7 Khasi AR7

ing of which the last drop of liquor remains adhering to the spout of the gourd is the name selected for the child. Then the puja performer invokes the god to grant good luck to the child. The father takes the pot containing the placenta, after having previously placed rice flour and fermented rice therein, and waves it three times over the child, and then walks out with it through the main entrance of the house and hangs up the pot to a tree outside the village. When he returns from this duty, before he re-enters the house, another throws water over the father's feet. The father, being thus cleansed, enters, and holds the rice flour to his mouth three times. Two people then, holding the dried fish by their two ends, break them in two. The powdered turmeric mixed with rice flour and water is applied to the right foot of the father, the mother and the child receiving the same treatment. The friends and relations are then anointed, the turmeric being applied, however, to their left feet. The bow, arrows, *da*, and a *star* are carefully placed inside the inner surface of the thatch on the roof, and the ceremony is over. Rice flour is then distributed to all who are present, and the male adults are given liquor to drink. After two or three months the ears of the child are bored and ear-rings are inserted. These ear-rings are called *ki shaskhor* (i.e. the ear-rings of the great-grandmother). Mr. Jenkins mentions that the naming ceremony amongst the Syntengs is performed by the "oldest aunt," presumably on the mother's side. A basket of eggs is placed in the centre of the room, and before the ceremony begins one egg has to be broken. Then the aunt of the child takes two sticks, and, raising them to her shoulder, lets them fall to the ground. Before they fall she shouts, "What name do you give the child?" The name is mentioned, and if, on falling upon the ground, one stick crosses the other, it is a proof that the name has won the approval of the spirit. If the sticks do not fall in this position, another egg is broken and another name is chosen, and the sticks are dropped as before until they fall in the required position, when it is understood by the performers that the name is a good one. Mr. Jenkins was informed by a young man "who had renounced heathenism" that some of the more cunning women cross the sticks before lifting them, and that

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

be a successful era in store for the people of the State. The goddess on this occasion may be regarded as a Khasi Demeter, although no mysteries form part of her services as at the Grecian Eleusis. The Nongkrem ceremony and dance (now held at Smit) take place in the late spring, generally in the month of May. A lucky day having been fixed, the Siem sends a ring of cane (*kyrwah*) by way of a summons to the people of every village in the State, at the same time informing them of the date of the puja, and requesting them to attend with their offerings, consisting of goats and different articles of food. In the meantime various pujas have been taking place in the house of *Ka Siem Sad*, the Siem priestess, which it would be tedious to describe in detail. The more interesting points only will be mentioned. A fortnight before the puja and dance at Smit the *sah-blei*, or high priest, pours out libations of liquor in the *kyrwa-diang*, or place where the sacrificial goats are kept, and in front of the great post (of *diang ewing*, or Khasi oak), in the house of the Siem priestess. Dancing then takes place in front of the post. Later on the Siem, with the high priest and other attendant priests, walks with extremely slow gait to a small hill where a stone altar has been prepared, and sacrifices a cock in honour of *u'lei Shillong*, or the god of the Shillong Peak. A silver dish with powdered rice, liquor in a gourd (*ka'iad ua*), betel-nut, and some leaves of the Khasi oak (*diang ewing*) are also necessary adjuncts of the puja. A goat is then sacrificed, and the sacrifice is followed by a dance of twenty-two men armed with swords and shields and chowries (fly-flaps). Having danced before the altar, the party returns to the house of the Siem priestess and executes another dance in the great courtyard. The Siem and certain selected persons dance in front of the *riskat blei*, or holy post of Khasi oak inside the house of the Siem priestess, the dancers being entertained with dried fish and ginger. Then follows the great dance of girls and men in front of her house. The girls dance in the centre, taking such tiny steps, that the lifting of their feet from the ground is hardly perceptible, the arms held down to the sides and the eyes demurely downcast. It is on this occasion that they wear the peculiar silver (and sometimes gold) crowns illustrated in the

1:Gurdo E-4, 5 (no date) 1907 AR7 Khasi AR7

301 plate. The hair is worn tied in a knot behind the head, but with
302 a long tailhanging down the back. Rich silk clothes are worn
535 by the girls, who present the appearance of being, if anything, overdressed, or, as Yule aptly puts it, of "perfect
[312] parallelograms." They wear a profusion of gold and coral
796 bead necklaces, silver and gold chains, bracelets, ear-rings of
782 gold, andany other jewellery they can lay hands on. Not only is the wealth of the family jewellery requisitioned by the fair *dilettanti*(it is only the unmarried girls who dance), but she borrows from her friends. The men dance round the outside of the circlewaving fly-flaps and prancing (often nowadays wearing hugehoots) with ungainly strides. The music necessary
[534] for the dance consists of *tangwari* (pipes), drums, and cymbals.
[312] This is *ki shad hynthei*, or the dance of the women. Then there is *ka shad mastieh*, or the dance of the men, who are gaily dressed, wearing plumes of black and white cock's feathers (*u thngh*) and hold swords and shields. After gyrating for some time, two men at a time rapidly approach one another and clashtheir swords together in mock combat. They then retire, an, after again revolving for a period, repeat the process; then other couples follow and take their place. This goes on until thelassmen get tired or are told to stop.

535 The above description may be taken as applicable to all
764 the Khasi dances. Dancing forms part of the ceremony of placing the ashes in the sepulchre of the clan. Dancing also forms a part of certain ceremonies performed at markets for the prosperity of the State and for the good of trade.

535 When I was at Mawsynram, at the time of the appointment of a Siem, I witnessed a very pretty dance called *ka shad lyngwed*, performedby men dressed like the fairy creatures of trees in their hands. This is most effective. Then
[301] followed a dance of some forty young girls, very well dressed, covered with the usual gold and coral beads and silver chains, and wearing the silver crown, or *pomplot*. The young women danced with great spirit, and with an absence of all shyness, but still with the greatest decorum. Many of the women, spectators as well as dancers, were observed to be without the usual *tep mah bhiah*, or head-cloth, the absence of which is always a sign amongst the Khasi women of merry-making. There were

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

considering. Some of the leading characteristics of the Lyngams will now be detailed. The Lyngams are by complexion swarthy, with features of Mongolian type. The men are of middle height and the women remarkably short, both being not nearly so robust as the Khasis, a result due probably to climatic influences, for the Lyngams live in fever-haunted jungles. The men have very little hair about the face, although a scanty moustache is sometimes seen, the hairs in the centre being carefully plucked out, the result being two tufts on either side. Beards are never seen. The women are ill-favoured, and wear very little clothing. The men wear the sleeveless coat of the Khasi and Mikir pattern, called *phongmarong*, which is made of cotton dyed red, blue, and white. This custom may have been borrowed from the Khasis. They do not grow their own cotton, but obtain it from the plains. They make their own dyes, *shonglong* (red) and *kur sai-long* (black). A cotton cloth, barely enough for purposes of decency, is tied between the legs, the ends being allowed to hang down in front and behind. Sometimes an apron is worn in front. At the present day the men wear knitted woollen caps, generally black or red, of the Nongpoh pattern (a sort of fisherman's cap), but the elderly men and head-men wear turbans. The females wear a cotton cloth about eighteen inches broad round the loins, sometimes striped red and blue, but more often only dark blue. A blue or red cloth is thrown loosely across the shoulders by unmarried girls, but married women only wear the waist-cloth, like the Garos. A cloth is tied round the head by married women, sometimes, Garo fashion. The women wear quantities of blue beads as necklaces, like their Garo sisters. They obtain the beads from the Garo markets at the foot of the hills. Brass ear-rings are worn by both sexes; the women, like the Garos, load their ears to such an extent with brass rings as to distend the lobes greatly. Silver armlets are worn by the head-men only, or by those who possess the means to give a great feast to the villagers. This is the custom of the Garo *nokmas*, or head-men. Both sexes wear bracelets. The men also wear necklaces of beads. The rich wear necklaces of cornelian and another stone which is thought by the Lyngams to be valuable. A necklace of such stones is called *u'piang bhi* (god's necklace).

The spectators now go to the side, the S'iem and the Rangbaha comes down to the place of sacrifice, while the Sob Blei receives the utensils and the sacrificial gifts and spreads them out in order on the ground. Then he takes the rooster in both hands and calls on the god Shillong with these words: "O god Shillong, thou who hast been seated since time immemorial! (ko Blei Shillong kumba la buh u long ibwa!)" With a deep bow he then offers the sacrifice five times. Rooster and goat are sprinkled with water, rice, and the flour from apu and ryngi, and are then beheaded. Then the examination of the entrails (dyhbot) takes place in order to see if the sacrifice was acceptable. The way of doing that will be given below. 796 752 [797]

After the end of the sacrifice the Sob Blei and a flute player lead the sword dance, after them the S'iem and the other dancers follow in turn. Various drums are beaten alternately and flutes are played through the whole night. When night falls the goats of the S'iem and those of the various districts of the kingdom of Nongkrem are brought for the sacrifice of the next day. [534] [534]

The day following the great market is called ka ngi Lyngka. It is the center point and climax of the whole ceremony. From early in the morning the crowds pour in from all sides of the Khasi Mountains. 796 752 535 535

Early in the morning an unmarried girl of the royal lineage (ka S'iem ba dang khynraw) dances in the house of the S'iem ïïd before the ribhoi Blei. Usually a granddaughter or nearer relative of the S'iem ïïd is chosen for this. Two men then take the girl in their arms and carry her with a rocking motion to the large open place in front of the ïïng ïïd.

Then the great folk dance begins. In the middle of the place musicians squat on the ground and play the drums and flutes, and strike the cymbals. The music is quite without art, only a repetition of the same [illegible] tones.

The women dancers move in a rather narrow circle around the musicians. Only the unmarried girls dance. The clothes they wear for it are very rich and frequently very valuable. Fine cloths, usually of red, yellow, or blue silk are draped over their bodies; the upper body and arms are covered by a satin jacket. Their hair is bound together in a bun behind their heads; a string hangs /facing p. 896. Fig. 5 Khasi Men Dancers in front of the ïïng ïïd. Phot. P. Fruth. Stegmüller, S. D. S. Fig. 6. Sword Dance of the Khasi. Fig. 7. S'iem ïïd and S'iem of Nongkrem. / /897/ down from the bun which usually ends in three tassels. The head is covered by a golden or silver crown of fine chased work, which is topped by a bunch of feathers or a bunch of artificial flowers. Around their necks they wear chains of gold or 292 [302] 301

JOURNAL

OF THE

ASIATIC SOCIETY OF BENGAL.

Vol. LXXIII. Part III.—ANTHROPOLOGY AND COGNATE SUBJECTS.

No. 4.—1904.

101 *Note on the Khasis, Syntengs, and allied Tribes, inhabiting the Khasi and Jaintia Hills District in Assam.—By* MAJOR P. R. T. GURDON, *Superintendent of Ethnography in Assam.* (With plates III—IV).

[Read 3rd August, 1904.]

142 1. *Physical characteristics.*—The men are seldom tall; they are generally well made, and possess great strength of limb,—of leg in particular. Their features show a resemblance to those of the Japanese; their complexions are fair, noses flat, lips thick, and eyes very frequently obliquely set. The women are good-looking, of a beauty type, and are cheerful and pleasant-mannered. Children are sometimes exceedingly pretty. Khasis are inveterate chewers of *pân*,—both men, women, and children; the distances from place to place being measured by the number of betel-nuts that can be chewed on the journey. The hair of the males is shaved above the forehead pretty high up, and the remainder is gathered into a knot at the back of the head. Very few 291 Khasis have much hair about the face. Both Khasis and Syntengs wear the sleeveless coat (*jymphong*) loin-cloth, *jain shiang* (a kind of

The goats were sacrificed by his sister's eldest son (*Sawa-i-lyawah*) and in charge of respective units at the open courtyard. The priests evoked the ancestors and ancestress and called upon them by name praying "Oh God and Goddess, I offer this sacrifice as our ancestors did. Bless the *Sawa*, his family and the people of his state. shall beseech you again on this day after one year. You create favourable weather by virtue of your power, bring clouds and rains to yield bumper crops and ensure a happy and prosperous life."

On the last day (Nonghi[illegible]) a man of Mawroh clan sacrificed a pig introducing an iron spike in its [illegible] throat. Nine pieces of meat from different parts of the pig's body were again offered to their five ancestors. The *Sawa* in the presence of his *Darbar* performed the last rites of festival by praying to U Shilong, when the Chief [illegible] Rymph clan also followed in the same way for seeking the blessings of their [illegible] half deep.

This brought the ritual to [illegible] end performed at the residence of *Sawa*. The five pieces of goat's and pig's meat offered to their five ancestors, were then handed over to the in-charge of the five units considered as somewhat higher in their State organisation. [illegible] distributed them as a suitable place in their unit, making a feast as a sort of public declaration of the completion of their greatest festival for the year.

Dances

535 796 [533]

Besides the ritual describe[illegible] festival, dance with the accompaniment of music formed an important aspect [illegible] the festival. A dance known as *Lai-ryngkah* had been a regular feature for [illegible] is held, second, third and fifth day. This dance has some interesting features [illegible] It has to be performed in pairs. The first pair was constituted by Chief [illegible] pairs and the Chief employed. Second to fifth pair with between the *Sawa* [illegible] of the eight units which *Sawa* along with [illegible] and the sixth pair. The subsequent pairs were [illegible] of an unmarried [illegible] to the gathering. They danced only after having formed by any two persons [illegible] with those in *Sawa* on the fifth day. This passing five before the Oak pillar (Ri[illegible]) [illegible] of the last rite of the festival.

A second type of dance (*[illegible] and mawrih*) was then performed in the courtyard by the musicians in w[illegible] on by the traditional drums (*nong-shad*) with [illegible] and tip-toes in the [illegible] of one hand only. The dance was always held in pairs first by musicians [illegible] and then dancers, who danced their traditional dress consisting of silk turb[illegible] (*Ihampong*) adorned with feathers, coloured sleeveless coat (*Iymphong*) [illegible] hair chains and coral necklaces. Later on they joined the procession, that [illegible] on to the adjacent hill where after the completion of the ceremony of goat kill[illegible], a [illegible] residence of *Sawa* ultimately.

[291] [301]

This dance (*[illegible]*) was performed by the Sawa family. It was held early in the morning of the fourth day in the central hall (*Sitar*) and also in the courtyard. The men put on their normal dress whereas the women dressed themselves with gold and silver crown (*pamrigin*), numerous silver ornaments and different coloured tissues. They dressed and braided the hairs into a knot just at the nape. The High Priestess who also danced with the members of the Sawa' family, stood in the middle of the line and chief musician stood at one end. They hold each other in hand and danced round the fire-place of the central hall (*Sitar*) in anti-clock-wise direction in accompaniment of music. The people assembled there, gave vent to their feeling in their customary way every time, before they resumed to make a dance time. Similar performance of dances were also held in the courtyard.

[291] [301] [302]

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

144 *Features.—In order to determine the ethnological position of the Khásis, we need dwell upon a few only of their physical characteristics, viz. those which are held to indicate that type of the human family, the Mongolian, to which they undoubtedly belong. A detailed description of their physiognomy would embrace forms and characters by no means common even to tribes occupying the hills in close proximity to them, much less valuable to all branches of the Mongolian stock. These differences in detail, which may be attributed mainly to local influences, render it extremely difficult, if not absolutely impossible, to trace out the exact relation which these mountain tribes bear to each other. But the Mongolian, or to use a more comprehensive term, the Turanian, physiognomy is unmistakable in them all—Khásis, Jaintiás, Garos, Nágas, Kuki, Manipuris, etc. The chief points may be briefly stated as follows:—

142 Colour tawny or yellow, though a darker hue is not entirely
[141] unknown; nose somewhat depressed, with a peculiar contraction
[302] towards the forehead at the glabellum, which is very flat and broad; face broad, flat, and squarish, with high and rounded cheek-bones; skull globular rather than square; eyes middle-sized and black, with a yellow tinge in the eyeball; eyelids obliquely set, but less acutely than in the Chinese and other Indo-Chinese races; mouth large, with prominent though not very thick lips; hair black, thick, and worn long, the orthodox style being to tie it up in a knot at the back, trying little with sex; beard remarkably sparse, but the
141 moustache more abundant than the beard. The lower classes go
[824] bare-headed; stature low in the majority of cases; constitution strong and robust; limbs thick, short, and stout; trunk long in proportion and very broad at the waist; calves over-developed, but this is considered an element of beauty, more especially in the women, who, on the average, are fairer and handsomer than the men; carriage ungraceful.

157 *Social and Moral Qualities.—Disposition very affable, gentle, and cheerful; rather industrious, but devoid of ingenuity and mechanical skill. In the industrial arts, such as masonry, carpentry,
291 and agriculture, they are amenable to training. Dress amongst the lower classes is confined to a fringed jacket rudely woven of hemp, extending down as far as the thighs, and leaving the arms bare, together with a scanty covering for the loins. The more respectable classes wear a turban of coarse cotton or silk for a head-dress, and a sheet of silk thrown loosely over the shoulders, together with a long

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR2

291 The Wáir men dress very much the same as the neighbouring Sylheti Hindus. The Wáir women, especially the Shelli-women, wear very pretty yellow and red checked and striped cloths. The cloak is not so frequently worn as amongst Khasis, except in cold weather. The Lyngam dress is very similar to that of the neighbouring Garos. The males wear the sleeveless coat, or *phong mawong*, of cotton striped red and blue, red and white, or blue and white, fastened in the same manner as the Khasi coat and with tassels. A small cloth, generally red or blue, is tied between the legs, one end of it being allowed to hang down, as with the Khasis, like an apron in front. A round cap is commonly worn; but the elderly men and people of importance wear turbans. The females wear short cloths of cotton striped red and blue, the cloth reaching just above the knee, like the Garos; married women wear no upper clothing, except in winter, when a red or blue cotton cloth is thrown loosely across the shoulders. The women wear a profusion of blue bead necklaces and brass earrings like the Garos. Unmarried girls wear a cloth tightly tied round the figure, similar to that worn by the Kachari. A bag of cloth for odds and ends is carried by the men slung across the shoulder. It should be mentioned that even in ancient times great people amongst the Khasis, like Siems, wore waist-cloths, and people of less consequence on great occasions, such as dances. The use of waist-cloths among the Khasis is on the increase, especially among those who live in Shillong and the neighbouring villages, and in Jowai and Cherrapunji.

[554]

[554]

TATTOOING.

304 None of the Khasis tattoo; the only people in the hills who tattoo are certain tribes of the Bhoi country which are really Mikir. These tattoo females on the forehead when they attain the age of puberty, a straight horizontal line being drawn from the parting of the hair down the forehead and over. The line is one-eighth to one-quarter of an inch broad. The Lyngams occasionally tattoo a ring round the wrist of females.

It Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

ing of which the last drop of liquor remains adhering to the spout of the gourd is the name selected for the child. Then the puja performer invokes the god to grant good luck to the child. The father takes the pot containing the placenta, after having previously placed rice flour and fermented rice therein, and waves it three times over the child, and then walks out with it through the main entrance of the house and hangs up the pot to a tree outside the village. When he returns from this duty, before he re-enters the house, another throws water over the father's feet. The father, being thus cleansed, enters, and holds the rice flour to his mouth three times. Two people then, holding the dried fish by their two ends, break them in two. The powdered turmeric mixed with rice flour and water is applied to the right foot of the father, the mother and the child receiving the same treatment. The friends and relations are then anointed, the turmeric being applied, however, to their left feet. The bow, arrows, *da*, and a *star* are carefully placed inside the inner surface of the thatch on the roof, and the ceremony is over. Rice flour is then distributed to all who are present, and the male adults are given liquor to drink. After two or three months the ears of the child are bored and ear-rings are inserted. These ear-rings are called *ki shaskior* (i.e. the ear-rings of the great-grandmother). Mr. Jenkins mentions that the naming ceremony amongst the Syntengs is performed by the "eldest aunt," presumably on the mother's side. A basket of eggs is placed in the centre of the room, and before the ceremony begins one egg has to be broken. Then the aunt of the child takes two sticks, and, raising them to her shoulder, lets them fall to the ground. Before they fall she shouts, "What name do you give the child?" The name is mentioned, and if, on falling upon the ground, one stick [illegible] the other, it is a sign that the name has won the approval of the spirit. If the sticks do not fall in this position, another egg is broken and another name is chosen, and the sticks are dropped so before until they fall in the required position, when it is understood by the performers that the name is a good one. Mr. Jenkins was informed by a young man "who had renounced heathenism" that some of the more cunning women cross the sticks before lifting them, and that

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

301 This stone is apparently some rough gem which may be picked up by the Lyngams in the river beds. A rich man amongst
556 them, however, is one who possesses a number of metal gongs,
534 which they call *wiang*. For these they pay very high prices,
436 Rs. 100 being quite a moderate sum for one of them. Being curious to see one of these gongs, I asked a *sirdar*, or head-man, to show me one. He replied that he would do so, but it would take time, as he always buried his gongs in the jungle for fear of thieves. Next morning
[531] he brought me a gong of bell metal, with carvings of animals engraved thereon. The gong when struck gave out a rich deep note like that of Burmese or Thibetan gongs. These gongs have a regular currency in this part of the hills, and represent to the Lyngams "Bank of England" notes. It would be interesting to try to ascertain what is their history, for no one in the Lyngam country makes them in these days. Is it possible that the Garos brought them with them when
534 they migrated from Thibet? The gongs are well known in the
622 Garo Hills, and I hear that when a *nokma*, or head-man, there
778 dies his corpse is laid out upon them. They thus possess also an element of sanctity, besides being valuable for what they will fetch to the Garos or Lyngams. We may hope to hear more about them in Captain Playfair's account of the Garos.

• 304 The Lyngams do not tattoo. Their weapons are the large-
411 headed Garo spear, the dao, and the shield. They do not usually
243 carry bows and arrows, although there are some who possess them. They are by occupation cultivators. They sow two kinds of hill rice, red and white, on the hill-sides. They have no wet paddy cultivation, and they do not cultivate in terraces like the Nagas. They burn the jungle about February, after cutting down some of the trees and clearing away some of the debris, and then sow the paddy broadcast, without cultivating the ground in any way. They also cultivate millet and Job's-tears in the same way. With the paddy chillies are sown the
241 first year. The egg plant, arum, ginger, turmeric, and sweet
231 potatoes of several varieties are grown by them in a similar
754 manner. Those that rear the lac insect plant *landoo* trees (Hindi *arhal dal*) in the forest clearings, and rear the insect thereon. Some of these people, however, are prohibited by a

[illegible] from October to December. For millet the seed is sown in April-May and reaped about six months later. Maize is usually sown in April-May and ripens in August-September. For pulses, generally three crops are raised in the district; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

For oilseeds and fodders the methods are almost of same nature. Harvesting of oilseeds takes place from October to January. Sowing takes place at the beginning of the year and are collected between February and May.

2.6.3 Agricultural implements.—The usual agricultural implements are a hoe, a sickle, three or four kinds of axes, a hammer, a crowbar which is used for the construction of irrigation channels, 'khorsa' and winnowing baskets. Bullock drawn plough is used in very patchy cultivation in parts of lower cultivation and in Bhui area and considerable use is made in the plains of the State.

2.6.4 General cultural practices.—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

2.7 Cottage Industries.—Cottage Industries, it appears, have not found very great favour among the people of the district. A few families here and there manufacture iron implements, earthenware, mats, baskets, rope and jewellery. In weaving, connected with other allied crafts, weaving of cotton clothes is now among the Kharis. The Kharis in Bhui area and in some adjoining North Cachar and Mikir Hills practise it only for their domestic consumption. At present, the Government is trying to popularise weaving in the district and the [illegible] have welcomed by the Kharis. Among other cottage industries production of tea leaves in the northern part of the district adjoining Karimganj district and tea growing throughout the district are worth mentioning.

2.8 The People.—The Kharis and Jaintias are a distinct ethnic group distinct from the neighbouring hill tribes. By nature they are hardy and laborious and in respect of manual labour they are free from any inhibitions. Side by side with the Kharis live the Mikirs, Garos and Nepalis who form respectively 3.32 percent, 3.38 percent and 3.75 per cent of the total rural population. Besides, there are plains people who are mostly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

2.9 Occupation.—The greater portion of the population of the district subsists on cultivation. More than 75 percent of the rural households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

I: Gordon E-4, 5 (no date) 1907 ART Khasi ART

the War country, it will be necessary to describe the land tenures and laws regarding land of each of these divisions separately. As land is always *jhumed* by the Bhoie and Lyngngim from year to year, customs regarding land with these people are naturally very simple. Taking land in the high plateau of the Khasi Hills first:—The lands are classified under two main divisions, (a) public and (b) private lands. The following are the different descriptions of lands in the first division:—

Ka ri Raj, or *ka ri Slem*, which are Siem's, or Crown lands. These lands are intended for the support of the Siem family, and they cannot be alienated. The Siems are, however, precluded by custom from levying a land tax on persons who cultivate such lands, the relation of landlord and tenant between the latter and their chiefs being unknown.

Ka ri Lyngdoh.—These lands are for the support of the Lyngdohs or priests of the State. In some Siemships, as in Mawiong Siemship, paddy is grown on these lands from which rice is obtained for the State pujas.

Ri skong, or village lands.—These lands are set apart to provide a supply of firewood, thatching grass, &c., and are the property of the village. The inhabitants of other villages are not allowed to enjoy the produce of such lands. Such lands can be cultivated by some of the village, but the latter possess only occupancy rights, and cannot transfer them.

Ki lawbyong.—These are sacred groves, situated generally near the summit of hills, composed of oak and rhododendron trees, which are held sacred (*lawbyong*), it being an offence, or sin, for any one to cut timber in the grove, except for cremation purposes. These groves are the property of the villages.

(b.) Private Lands. These may be subdivided into *ki kur*, or lands which are the property of the clan, and *ri kynti*, family, or acquired landed property. In the Khasi Hills proper a very large proportion, certainly of the high lands, is the property of the clan; for instance, the high lands at Laitkor, which are the property of the Khar kongor and Kur kalong clans, whose ancestors the large memorial stones close to the Laitkor road commemorate, also the lands of the Thang Khew clan, and many others.

more than a thousand of them who have been converted to the Hindu religion. 162 (997)

This group of people possesses the possibility of expansion, since they have at their disposal within the area of the Khasi and Jaintia Mountains a territory of 6,822 English square miles, with only 40 persons per square mile. Although wide areas are not built up and the system of shifting fields prevents the full utilisation of the land, it is still true that with this small population figure by far the largest part of the whole population (200,761) is dependent on agriculture; trade and manufacturing only play a subordinate part. [361]

With regard to the division of the sexes, the two large religions of Assam, Hinduism and Mohammedanism, show the same proportion as in the rest of India, a lower number of women than men. But among the Khasi the women are more numerous than the men. In the Brahmaputra valley with its greater Hindu population there are only 892 women for every 1,000 men; in the Surma valley, with a greater Mohdem element, there are 937. But the situation is reversed among the Khasi, where there is a surplus of 16 women for every thousand men. The position of the women is basically different among this people. It is based on the customs and usages of maternal rights that prevail among them, which are predominantly based on primitive and which find honorable expression in possession. 562 162

I. Property Rights in the Family Property.

The great principle which governs property among the Khasi, is that all family property rests in the hands /120. A/ /Fig. 1. Khasi Girls and Women with their Carrying Baskets. Fig. 2. An Old Clan Mother in the Village Lalumthiew. / /120. B/ /Fig. 3. At the Oracle of Egg Throwing/. Fig. 5. Khasi Girls and Men in Festive Dance Clothing. / /120. C/ /Fig. 6. A Group of Spinning/ /120. D/ Fig. 4. A Holy Grove and Part of the Village Rolkeng/ /120/ of the women and not of the man. The man can never be the owner of family property, and it can never be transferred to him. He may perhaps acquire some property through his own industry and work, but even that will pass into feminine hands by the path of inheritance. The concept of family is not as narrowly drawn here as in our country. This is a question of the clan-family, the clan. The head of it is always the youngest daughter, who, even when she has become old, bears the honorable name ka kaid in the Jaintia Mountains, and in the Khasi Mountains ka Khadduh, the last, the youngest. Around her gather her nearest blood relatives, brothers and sisters, and children. For example let 421 613 576 613 576

(a) so take such a clan mother with the name Ka Sing Lan. She has two
(b) sons and five daughters, and in addition two brothers and two sisters who are all married. Also each of the five daughters and two sisters has four children. These forty-six people live with the clan mother and form the family clan of the Lan. To these we also add the sons
(b) and brothers, the nephews and grandsons, but not their children. The latter have nothing to do with the family Lan but belong to the family clan of their wives, live with that clan and are counted in it. Likewise neither the husband of Ka Sing Lan, nor the husbands of the various daughters, sisters, nieces, and granddaughters belong here. They are all counted with their own clans, live and work with them according to Khasi custom, and only visit their wives occasionally perhaps after dark.

(c) The entire clan-family of Lan is housed in 3 or 4 huts, which all
(d) stand next to each other in a semicircle or are built one above the other on the slope of a hill, according to the character of the land. A
(e) garden frequently surrounds them in which maize, sweet potatoes, potato-like roots of tuk-ur and bolsoi, bananas and, on the southern slopes of the Khasi Mountains, also coffee, pineapples, and other fruits are cultivated. A circle of bamboo cane that is so important for building purposes, household objects, and /130/ implements surrounds the garden and huts. This bamboo cane grows up so thick as an area to a height of 10 or 15 meters and at the same time forms a good protection against bad weather. A wall (nawrka) of thrown-up earth encloses everything, forming an enclosed farm, prevents unimpeded access, and protects cattle and crops from the attacks and devastations of wild animals.

(f) What is considered the family property of such a clan? Primarily
(g) is to the land, the garden, the rice fields, woods, fallow mountain and grazing lands. On the southern slopes of the Khasi Mountains there
(h) are fields for the cultivation of rape, orange groves, laurel groves, plantations of betel palms and of pepper leaves which far and wide are so highly treasured for betel chewing as a source of pleasure. (3)

3. Cf. Becker, Im Hinterland des Brahmaputra, /In the Rivers Valley of the Brahmaputra/ (Munich, 1923), pp. 107 ff.

(i) Usually there is so much land available that the family-clan can
(j) enrich itself properly and also increase in number.

(k) According to its size and wealth a family clan also owns a
(l) corresponding number of cows, oxen, horses, pigs, and goats. Neither the milk nor the flesh of the cows is used. They are kept for the

CHAPTER III

The Border Area

3.1 Definition of Border Area.—The term 'border area' although very frequently used does not refer to any well defined area. It was, therefore, decided after a joint discussion between the Director of Statistics with the Deputy Commissioner of the district and Subdivisional Officer, Jowai, that area within 20 miles of the Indo-Pak border line would be considered as the 'border area' for the purpose of the present survey. The list of the villages falling in this area was supplied by the Deputy Commissioner and the Subdivisional Officer.

3.2 Condition of the Border Area before partition.—The border area under review thus comprised of the southern slopes of the Khasi and Jaintia Hills and a narrow strip of plains adjoining the southern slopes running along the Pakistan border. The area extends between over a length of about 200 miles, roughly from Mahadeb on the east to Sonapur on the west, thus covering an area of 1,848 sq. miles approximately, comprising of 454 villages inhabited by population of 74 thousands.

Barring the barren and rocky top plateau the slopes are utilised as the production of valuable cash crops on economic scale. These slopes provide suitable soil and climate for the production crops like arecanut, mandarin, betelnut, oranges, pineapples and other fruits. On account of rich yields which such plantations give to the cultivators these slopes were more densely inhabited and intensively cultivated than would appear possible from the topography of the area. Even the most inaccessible parts in the slopes but been converted into rich orchards, wherefrom the produce was carried by headloads over steep gradients for several miles. Due to steep gradients little other use, except some grazing here and there, could be made of this area.

Because of the very topography, the land had no natural communions with further distant area lowlying part of East Pakistan. From time immemorial the area had a flourishing trade with further distant. It was a barter trade. The cash crops found eager buyers in the people of Sylhet, from whom in turn the people in the border area obtained supplies of rice, fish, vegetables and other necessities of daily life. This in proportion that they enjoyed a very prosperous and settled economy. The rich buildings in the border area villages which are now lowing away, bear eloquent testimony to the past prosperity of the border economy.

With the partition of the country in 1947, trade with the plains of Sylhet, now forming part of East Pakistan, was restricted. As a result the whole economy of this region was completely shattered and the countryside which was humming with activity and abundance was pervadedwith a gloomy poverty and despair. All the rich orchards belonging of the border people lost the market in East Pakistan. For want of communication facilities the produce could not be

TABLE [illegible] (contd.)

6.5 It is significant that in all the three areas a considerable section of wholly agricultural families and families following agriculture as principal occupation are landless. On the other hand, a considerable proportion of the families with agriculture as subsidiary occupation or independent of agriculture hold land of various sizes. The fact that agriculture for those families who possess sufficient land, was reduced to a subsidiary occupation is possibly more due to less return from agriculture than their attachment to it.

FRAGMENTATION

6.6 It has been observed that a large number of rural families have small holdings, the very smallness of which render their holdings uneconomic. In addition, the holding of rural families suffer most from the evils of fragmentation. Often holdings are not in compact blocks but are scattered all over and surrounded by lands in possession of others or some uncultivable waste land. Some of the fragments lie even in separate villages.

Unlike in the plains district, fragmentation here was brought about not so much by population pressure (except only in case of wet paddy field) or inheritance holdings or each other (which in) would give rise to excessive fragmentation of holdings. This is because there is no settlement operation and the people are free to realise as much of the Raj land as possible for their cultivation. Fragmentation here is thus more a product of the topography of the district, for cultivable land in large compact block is not easy to get and cultivable land have to be found in isolated pockets.

The extent of fragmentation is revealed in the following table :

TABLE D-4

Distribution of buildings according to number of fragments.

923

19: Accession C-5 (1956) 1963 ASF Sheet ASF

The total number of fragments in ASF holding in Zone of area is 2,540 giving an average of 9.64 fragments per holding. In [illegible] holdings in project area is [illegible] which gives on the average 2.34 fragments per holding, while in General area 165 holdings comprise of 440 fragments, i.e., 2.66 fragment per holding. A comparison of the above figures with the average fragment figures of 3.61, 4.50, 4.60 and 3.95 per holding in Mbar Hills, Dambaya, Sibangir and Lakhimpur districts respectively goes to show that incidence of fragmentation in this district is higher than that in Mbar Hills but less than that in other districts.

It will be seen from table D4.1 of the appendix that in the small holding group (less than 5 acres) average number of fragments per holding is 3.90 in Border, 3.60 in Project and 2.60 in General area. The average size in the corresponding holding group being 1.50 acres 1.67 acres and 1.55 acres in Border area, Project area and General area, the average size of fragments in the respective area works out at .40 acres, .45 and .58 acres. Similarly it will be seen that average sizes of fragments for medium holding group are, in Border area 1.61 acres (average size of medium holding 6.03 acres) in Project area 1.85 acres (average size of holding 6.05 acres) and in General area 1.51 acres (average size of holding 6.05 acres), these for large holding group being 2.21 acres, 2.06 acres and 2.49 acres respectively against the average large holding size of 18.05 acres, 16.25 acres and 12.53 acres in the respective area.

Factors

4.1 The operating unit in the rural agricultural system is in most cases the family farm. Functions, organisation, control and manual labour as regards to the agricultural operations in these farms are done through a joint effort of the family unit. Family permanent farm servants are maintained through employment of manual labourers are employed during the busy seasons.

In this enquiry a farm has been defined as comprising of all agricultural land operated by a single family with or without employment of labour. The family may or may not have the right of permanent occupancy and inheritance over the farm land operated by it, and in this case the farm is distinguished from holding which comprises of such land only over which the family exercised permanent right of occupancy and inheritance.

341
311

It will be seen from the above table that the total number of farms in each of the three areas is greater than the number of holdings in the corresponding area. There are 388 farms in Border area villages, covering a total area of 3918.18 acres, whereas the corresponding figures in case of holdings, as we have already seen, are 89y and 3166.62 acres. In Project area 311 farm cover an area of 1896.19 acres, the corresponding figures being 662 and 1991.43 acres, while in General for holding area there are 171 farms which cover 945.81 acres as against 185 holdings covering an area of 613.34 acres. Two reasons may be attributed to these differences. In the first place, proportions of village land are owned by people from outside and rented out to people of the village. Secondly, there are some among the right holders who cultivate only part of their land and the remaining portion is either left fallow or leased out to others. The position will be made clear from a study of subsequent tables viz., D-6 and D-7 given elsewhere in this chapter.

The average size of farms for Border area, Project area and General area respectively are 3.16 acres, 3.24 acres and 2.20 acres which again are less than the corresponding figures of holding of 3.19 acres, 4.19 acres and 3.38 acres. The average size of farm is, however, hardly an adequate measure for judging the conditions of the farmers in as much a large proportion of cultivators (69%, 56%, and 51%, in Border area, Project area and General area respectively operates small size farms of less than 3 acres (exact average being 1.33 acres for Border, 1.16 acres for Project and 1.66 acres for General area) and the total farm area cultivated by these cultivators constitute only 11%, 42%, and 48% of the total farm area in the Border area, Project area and General area respectively. In these areas proportion of families operating middle-sized farms, i.e., between 3 to less than 10 acres are 41%, 40%, and 42%, covering respectively 48%, 54%, and 50% of the total farm area in the respective village group. Proportion of families operating large sized farms, i.e., 10 acres and above in Border area, Project area and General area is respectively 19%, 9%, and 8%, possessing a comparatively bigger size of farm land amounting to 41%, 34 per cent and 18 per cent of the total farm land in the respective area.

6.7 The following two tables give the distribution of farms and farm areas respectively according to size and ownership.

19: Assam G-5 (1956) 1963 A87 Khasi A87

241 311 433 **8.5—Relative importance of crops**—Total gross farm area harvested amounted to 1324.00 acres in Border area, 1700.00 acres in Project area and 961 acres in General area.

From above table it will be seen that in Border area, orange accounted for the highest proportion of harvested area, i.e., 31 per cent, followed in order of importance by betel nut, paddy, betel leaf and millet which respectively accounts for 17 per cent, 13 per cent, 9 per cent and 3 per cent of the total harvested area. Other crops which account for 249.00 acres (7 per cent) includes maize, ragada, banana, turmeric, dal, blackpepper and other fruit crops.

Considering sale proceeds, it is clear that betelnut happens to be the main earner accounting for 68 per cent of the total sale proceeds followed by orange, paddy and betel leaf which respectively account for 12 per cent, 6 per cent and 3 per cent of the total sale proceeds. Thus orange and betel leaf which in proportition days were the main earner-crops in the Border area have been passed to second and forth position respectively—the proportions fetched by them, particularly by betel leaf, being negligible. On other hand as there is a good market for betel nut, Border people have taken to betel nut cultivation in a more extensive scale.

241 243 311 433 It is significant that while in Border area total farm area is 8974 acres, total area harvested comes to only 1325 acres including area under mixed cropping which is in wide practice in Border area particularly for orange, betelnut, and for some other minor crops. Thus proportion of unharvested farm area emerges out to be considerable which can be accounted for the following reasons:—

(1) The farm area includes some new gardens particularly of betelnuts which usually take quite a few years to bear fruits.

[44] (2) Reportedly a large number of orange and betel-leaf gardens were not harvested at all as there was no market for them.

241 433 441 Turning our attention to Project area and General area, it will be found that paddy eclipses all other crops in as much as in the two areas it respectively covers 62 per cent and 64 per cent of the total harvested area in the respective area. In Project area paddy is followed by betel leaf, orange, potato and betelnut in order of importance while in General area it is followed by potato, millet, orange, betel leaf and betelnut. In both the areas it will be seen from table above, almost all the crops retain their respective position in value. Considering sale proceed, in Project area, paddy occupies the highest position accounting for 77 per cent of the total sale proceeds followed by betel leaf, orange, betelnut and potato accounting respectively for 9 per cent, 3 per cent, 2 per cent and 1 per cent of the total sale proceeds. In General area, in order of importance of sale proceed paddy, potato and betelnut are worth mentioning fetching respectively 62 per cent, 30 per cent and 6 per cent of the total sale proceeds.

accounting for 42, 54 and 50 per cent of the total holding area in the respective areas. Large holding (10 acres and above) covering 44, 28 and 16 per cent of the total holding area in the Border, Project and General areas respectively were possessed by 48, 7 and 3 per cent of the families of the respective areas.

The average size of family holding worked out at 9.2 acres for Border area, 4.1 acres for Project area and 5.5 acres for the General area. The average size of cultivated holding per family in the three areas was found to be 5.1, 3.4 and 3.8 acres respectively.

10.5. The total number of farms in Border area, Project area and General area were respectively 298, 611 and 171 covering respectively 7916.10 acres, 1008.79 acres, and 573.01 acres, bringing the average size of farms to 9.16 acres in Border area, 3.94 acres in Project area and 3.00 acres in General area.

Percentage distribution of these farms and farm area by different size group is depicted in the following table

Nature of Income Tax	Budget Area			Budget Area			Closed Area		
	P.C. of Rural (Rural)	P.C. of Urban (Urban)	Average Rural (Rural)	P.C. of Rural	P.C. of Urban	Average Rural (Urban)	P.C. of Rural	P.C. of Urban	Average Rural (Rural)

20: Hunter G-4 (no date) 1897 AR 7 Khasi AR 7

The forest administration of the British Government is confined to two plantations in the neighbourhood of Shillong, for which a rent is payable in perpetuity. One of these, on the further side of the Umkra, was originally acquired in 1871-72 for the sake of experiments in arboriculture. The rent of Rs. 50, or £5, is paid by the Forest Department; the area had been at first estimated at 580 acres, but an actual survey undertaken in 1873-76 reduced this estimate to 262·39 acres. A considerable portion is covered with Pinus Kasia, which is carefully protected. Of the exotic trees tried on this plantation, only the three following can be said to have done well: Juglans regia, Eucalyptus rostrata, and Pinus maritima. All the rest either suffered from frost in the winter, or required far more nursing than can be afforded them in forest plantations. The young trees of the indigenous oak (Quercus serrata) were also attacked by rats, who bit off great numbers just above the ground. The Spanish chestnuts did not thrive, and were removed to the model farm for trial at a higher elevation. The second plantation, on the northern slopes of the range immediately behind the Station, consists of several patches of forest, which were acquired in connection with the scheme for providing Shillong with a permanent water supply. The total rent is Rs. 375, or £37. 10s., paid from Town Improvement Funds; and the aggregate area is estimated at 796 acres. All the fields within this area that had formerly been cultivated by the Khdaifo—about 80 acres in all—were sown by the Forest Department with Pinus Kasia, Quercus Griffithii, Q. serrata, and Q. fenestrata, which have succeeded well; and about 8 acres were planted with different species of Eucalyptus. Up to the close of 1873-76 the sum expended on the first of these two plantations was Rs. 742. 9. 9, or £74. 3s. 3d., and on the second, Rs. 732. 9. 6, or £73. 12. 6d.

137 648 65

311 177

A cinchona plantation was started in 1867 by the Superintendent of the Calcutta Botanical Gardens. It consists of twelve small patches of plants near Nongklon, and one near Jirang, situated at elevations varying from 3500 feet to 2000 feet. The species cultivated are Cinchona succirubra, C. officinalis, and C. micrantha. At first they were under the charge of two Khasi gardeners, who each received Rs. 16 a month, or £19. 4s. a year, to weed them and keep frost out. In 1874-75 these plantations were taken charge of by the Forest Department, and specimens of the cinchona bark were submitted for analysis to the Government Quinologist

(9) Cotton is grown on high lands and
248 slopes; it is sown in April, and becomes fit for picking by January.

311 Area and Out-turn of Crops.—According to the Assam Administration Report for 1875-76, the area of the British portion of
241 the Khásí and Jáintiá Hills District amounts to 2160 square miles,
648 of which only 110 are under cultivation; of the remainder, 1337 square miles are set down as cultivable, and 713 as uncultivable. The total area of the semi-independent Khásí States is given as 3997 square miles, of which 176 are under cultivation, 2561 are cultivable, and 1260 uncultivable. In another portion of the same Report, the area under various crops throughout the entire District is thus approximately estimated:—Rice, 59,880 acres; other food grains, 57,820 acres; cotton, 1076 acres; potatoes, 33,880 acres. The average out-turn of rice per acre is returned at 8 *maunds*, or nearly 6 cwt.; of other food grains, 3 *maunds*, or over 2 cwt.; of cotton, 2 *maunds*, or 1½ cwt.; of
[435] potatoes, 55 *maunds*, or nearly 40 cwt. The price of rice in 1875-76 was Rs. 4 8 per *maund*, or 12s. 8d. a cwt., which gives Rs. 36 or £1. 12s. as the value of the rice crop obtained from one acre.

241 Condition of the Peasantry.—The Khásiís can scarcely be considered an agricultural people, as they do not grow sufficient
423 grain for their own subsistence, and are dependent to a great
433 extent on imports of rice from the neighbouring Districts. Ten acres is generally considered a comfortable holding for a husbandman in the position of an ordinary Bengal peasant, but scarcely any man in the Hills depends entirely upon the produce of his land for
[231] his support. In the Jáintiá Hills a cultivator's position is con-
[554] sidered to be very low if he possesses no cattle, but performs all the operations of agriculture with his own hands. In that portion of the District, five acres is all that can be cultivated with a single
[465] pair of oxen, the average being four acres. A husbandman with a holding of five acres would not be so well off as a retail shopkeeper, nor would it enable him to live as comfortably as he could on a money wage of Rs. 8 or 16s. a month. The peasantry, however, as a class are not in debt. The land is owned chiefly by small proprietors, who occupy and cultivate their hereditary fields. The relations of landlord and tenant do not exist in the Hills, and no rent is payable to any one; consequently the principle of Act x. of 1859 (the Rent Law of Bengal) has no application.

231 The Animals used in agriculture are oxen; goats and pigs are
435

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

241 when fire is applied, logs of wood being placed at intervals of a few feet to prevent as far as possible the ashes being blown away by the wind. The lands are not hoed, nor treated any further, paddy and millet being sown broadcast, and the seeds of root crops, as well as of maize and Job's tears, being dibbled into the ground by means of small hoes. No manure, beyond the wood ashes above mentioned, is used on this class of land; there is no irrigation, and no other system of watering is resorted to. The seeds are sown generally when the first rain falls. This style of cultivation, or *jhum*, is largely resorted to by the people inhabiting the eastern and southern portions of the Jaintia Hills, e.g. the Bhois and Lalungs, the Lynngams and
243 Garos of the western tracts of the district. Wet paddy land
312 (*hali* or *pynthor*) is, as the name implies, the land where the kind of paddy which requires a great deal of water is grown. The bottoms of valleys are divided up into little compartments by means of fairly high banks corresponding to the Assamese *ális*, and the water is let in at will into these compartments by means of skilfully contrived irrigation channels, sometimes a
243 mile or more in length. The soil is made into a thick paste in the Jaintia Hills by means of the plough, and in the Khasi Hills through the agency of the hoe. Droves of cattle also are driven repeatedly over the paddy-fields until the mud has acquired the right consistency. The seed is then sown broadcast in the wet mud. It is not sown first in a seedling bed and then transplanted, as in Assam and Bengal. When the plants have grown to a height of about four inches, water is let in again; then comes the weeding, which has to be done several
243 times. When the crop is ripe, the ears are cut with a sickle
784 (*ka rashi*) generally, so as to leave almost the entire stalk, and are left in different parts of the field. A peculiarity about the Lynngam and the Khasis and Mikirs of the low hills, or Bhois as they are called, is that they reckon it *sang*, or taboo, to use the sickle. They reap their grain by pulling the ear through the hand. The sheaves, after they are dry, are collected and
243 thrashed out on the spot, either by beating them against a stone (*shoh kba*), or by men and women treading them out (*iuh kba*). Cattle are not used for treading out the grain. The grain is then collected and placed in large bamboo receptacles

mould. The plant[1] is watered by means of small bamboo aqueducts which are constructed along the hill-sides, the water being conducted along them often considerable distances. As in the plains, the leaves of the *pán* creeper are collected throughout the year.

The bay leaf (*'la tyrpád*, or *tezpát*) is classified in the *Agricultural Bulletin* as *Cinnamomum tamala*, and there is a note in the column of remarks that "this tree, as well as one or two others of the same genus, yields two distinct products, *tezpát* (bay leaf) and cinnamon bark." The bay leaf is gathered for export from the extensive gardens in Maharam, Malaisohmat, Mawsynram, and other Khasi States. The plants are raised from seed, although there are no regular nurseries, the young seedlings being transplanted from the jungle, where they have germinated, to regular gardens. Bay leaf gardens are cleared of jungle and weeds periodically; otherwise no care is taken of them. The leaf-gathering season is from November to March. The leaves are allowed to dry for a day or two in the sun, and then packed in large baskets for export. The gathering of bay leaf begins when the trees are about four years old.

The following are the other minor crops which are grown in the Khasi and Jaintia Hills:—

Pineapples, turmeric, ginger, pumpkins and gourds, the egg plant, chillies, sesamum, and a little sugar-cane. The arum* (*ka shiriw*) is also extensively grown in the hills, and forms one of the principal articles of food amongst the poorer classes; it is generally raised in rotation with potatoes, or is planted along with Job's tears. The stem of the arum is sometimes used as a vegetable, also for feeding pigs.

In the Jowai Sub-Division, notably at Nartiang, there are fairly good mangoes, which are more free from worms than those grown in the plains of Assam.

The Bhois and Lynngams cultivate lac. They plant *arhar dal, u landoo*, in their fields, and rear the lac insect on this plant. Last year the price of lac at Gauhati and Palasbari markets rose as high as Rs. 50 per maund of 82 lbs., it is said, but the price at the outlying markets of Singra and Boko was

* Colocasia esculenta, Beng. *Kachu*.

[1] [i.e., the pán - - - Analyst]

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

327 Colonel Lister, writing in 1853, estimated that 20,000 maunds
439 of iron were exported from the hills in the shape of hoes to
412 the Assam Valley, and in lumps of pig iron to the Surma Valley, where it was used by boat-builders for clamps. Nowadays the smelting of iron is carried on in very few places. There are still smelting-houses at Nongkrem and Nongsprung, but these are practically the only places left where smelting of iron ore goes on; there are many forges where rough iron brought from the plains is melted down and forged into bill-hooks and hoes. Messrs. Yule and Cracroft have described the
113 native process of smelting iron, and it is only necessary to refer
114 to their papers if information is required on the subject. Yule's
327 account is a very full one, and is to be found at page 853, vol. xi. part ii. of the Journal of the Asiatic Society of Bengal. The system pursued, both in the extraction and in the subsequent smelting of the ore, is the same at the present day as that
327 described by Yule. Dr. Oldham, writing in 1863, says, "The quality of this Khasi iron is excellent for all such purposes as Swedish iron is now used for. The impurity of the blooms (or masses of the metal in a molten state), however, as they are sent to market, is a great objection to its use, and the waste consequent thereon renders it expensive. It would also form steel or wootz (Indian steel) of excellent quality. I have no doubt that the manufacture could be greatly improved and possibly extended." Dr. Oldham, however, goes on to remark that the manufacture of iron could not be very much extended, owing to the scanty dissemination of the ore in the rocks, and
[312] the consequent high cost of obtaining it. At present the want of any permanent supply of water prevents the natives from working for more than a few days during the year, whilst the rains are heavy, and they can readily obtain sufficient force of water for the washing of the ore from its matrix. The export of iron in any form from the district has now almost died out, only a few hoes being brought down by the Khasis from Laitdom, in Khadsawphra, to the Burdwar and Palasbari markets in the Kamrup District of the Assam Valley. Iron of English manufacture has, of course, much cheapened the market, but probably the fact that the parts of the country in the neighbourhood of the rocks which contain the metal have

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi–Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional custom nor a simple blueprint of ill-fitting all-India legislation. The major political schism at this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. [Cf. Gait 1926; Aitchison 1931; Bhuyan 1949; Morris 1910.]

175 619 648 [726] [651] [177] 177 648 244 439 134 797 428 635 633 167 563 423 [873] 648 642 [651] [563] [113]

SETTLEMENT PATTERN AND HOUSING. **Settlement pattern.** Khasis live sedentarily in named, nucleated, and unplanned villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

361 [312]

435 659 Regarding supply of foodgrains through fair price shops, the position appeared to be unsatisfactory. Complaints were heard from some villagers coming from the interior villages that they very rarely get rice from fair price shops, which are usually allotted to bigger villages, sometimes too far from the villages tagged to it. Even the people of the villages where there were fair price shops, complained that the supply of rice to these shops was inadequate and the price also was very high which in some areas was even as high as Rs. 31·00 per maund.

164 312 In a majority of the villages investigated, water supply and medical facilities were not satisfactory. Malaria, dysentery and other bowel diseases are common in this area.

743 The table above clearly shows that the medical facilities obtainable in these villages are far from satisfactory. Only 6 villages out of 28 villages have a dispensary either located in the village or within a radius of five miles. Considering the lack of communication facilities and the hilly nature of the district even five miles is often too long a distance for a patient to go to the doctor or for a doctor to attend a patient. When the doctor has to cover long distances the charges become too high. As a result the poorer sections in case of serious illness have to approach unqualified medical men when one is available or otherwise to depend upon the mercy of God. Even for quinine and other cheap medicines one has to go to a dispensary or a private medical practitioner miles away. Reportedly, the more disheartening fact is that the medical help received by the people from Government dispensaries are not often timely and adequate due to non-availability of a doctor and in-adequacy of stock of medicines.

361 364 4.4 **Sanitation.**—Though conditions of housing, sanitations, etc., of the villages are described in village notes in the appendix, it will be pertinent to make some general observations on the point. Unlike other hill tribes, the Khasis select their house sites on the hill slopes and level lands by the side of the hills as a protection from winds. From the fact that the villages are situated in the slopes one might be tempted to think that the sanitary and drainage system of the villages should be quite satisfactory. But in fact it is otherwise in many cases particularly in the case of big villages where too many families huddle up constructing their houses very close to each other thus practically converting the village into a slum. Many of the villages, due to their very location in groves surrounded by thick jungles do not get sufficient sun-light and as a result always remain damp, facilitating frequent incidence of cold and influenza. People answer the call of nature in jungles and bushes in and around the villages. Many of the villages are built on level lands full of swamps, mud and tall weeds, places which provide good breeding place for mosquitoes. Cowsheds and pig sties are built close to the residential quarters which make the villages all the more dirty. Indeed, there are villages enjoying excellent sanitation and health but in majority of the villages there remains a lot to be done for improving the sanitary, drainage systems for educating the people to make their villages more hygienic. From the Government side also, elaborate measures should be adopted to combat and eradicate malaria which is still causing [312] havoc in the district. Similarly, drinking water supply schemes should receive a high priority in a programme of development.

342 4.5 **Housing.**—Majority of the houses in the interior areas are made of thatch and bamboo with wooden planking or stone or earthen floor. Walls are plastered with mud. In higher altitudes houses are lowly roofed presumably as a protection against wind and heavy rain. Some of these houses assume the shape of a half buried cylinder. They generally have only one opening through the main door, though some of them have another in their rear end. They generally contain only two small rooms. One who is not used to such conditions wonders how the inmates, especially when there are five or six of them, could feel comfortable. Houses of the well-to-do people particularly those on the road side, are built in the modern style with C.I. roofing, plank floor, mud plastered, whitewashed

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

133 they form rapids, the waters precipitating themselves down deep, rocky gorges and chasms, choked with huge boulders. Some of these gorges are very beautiful; the streams, being hemmed in between stupendous mountains and rocks covered with primeval forest, run in narrow but very deep channels swarming with fish. No islands or lakes are formed by any of the rivers, although several of them have large, deep pools. They are all unfordable during the rains.

312 UTILIZATION OF THE WATER SUPPLY.—None of the rivers are utilized as a motive power for turning machinery, although the streams on the higher plateaux might be easily turned to such an account. Their waters, however, are extensively used for the purposes of irrigation, and the hill people display great ingenuity in cutting channels or aqueducts for leading the water on to their [365] fields. It is in this manner that the Civil Station of Shillong receives its water supply. Aqueducts convey water to the houses of all the European residents; and branch channels from the main aqueduct flow through the *bázár*, and along the streets occupied [226] by the native inhabitants. No fishing towns exist in the hills; but [563] near where the rivers debouch upon the plain are some valuable fisheries, which are annually let in farm, the lessees being generally Bengálís. These fisheries yield an annual Government revenue of about £300. Embankments in order to protect the land against floods do not exist. A few embankments, or rather dams, are thrown across narrow valleys between hills, so as to create reservoirs for water. At Shillong there are a few tanks thus formed, which are both useful and ornamental.

135 MINERALS, ETC.—Coal and limestone, both of excellent quality, are found in abundance. Lower Bengal obtains nearly the whole of its lime supply from the Khásí and Jáintiá Hills. The lime is known as 'Sylhet lime,' and is obtained by quarrying from the beds of stone which line the base of the mountains along the whole length of the Sylhet boundary. The supply is literally inexhaustible. Coal out-crops at Cherrá Púnjí, Lá-ká-dong, Shellá, Máo-syn-rám, and at several other places; but as a rule it is scattered, and found in places difficult of access. The coal, however, is of excellent quality, and leaves very little ash. Stone, well adapted for building purposes, is also found. Ironstone exists almost everywhere throughout the Hills, but principally in the dependent States of Khyrim, Nongspung, Cherrá, and Mylliem. In former years the Khásiás were

000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

extent of waste land, some is cultivated in a manner resembling the *júm* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *júmiá* tenure. Any renting of land is exceptional, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

MANURE is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilized for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 2s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 243 244 [435]

IRRIGATION for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

MODEL FARM.—The Shillong Model Farm, established in 1873, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red roughs' and 'pheasant's eye'—were successfully introduced in 1873-74; but these are not looked upon favourably by the Khásiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unfitness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1744 177 244 648 654 177 245 648 654 [134] [136] 231 648 654

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

731 pre-eminently filthy villages on the Cherrá Púnjí plateau the epidemic appears to have found a fitting home, for it stayed among them for a period of nine weeks and a half. The civil surgeon reports the deaths at Cherrá Púnjí and the surrounding villages to have amounted to about 175 out of a total of 232 cases. During the year 1876-77 hooping-cough and small-pox were prevalent in an epidemic form. In the Jáintiá Hills small-pox is stated to have caused 47 deaths, chiefly during the months of June, July, and August. Some fatal cases of hooping-cough occurred among the Khási children in the village of Máokhar, near Shillong. The only two cases of cholera reported were in the Jáintiá Hills.

16 VITAL STATISTICS.—A general system of registration is not [659] attempted throughout the Khási and Jáintiá Hills District. Statistics [648] of births and deaths are only collected among the inhabitants of the Stations of Shillong and Cherrá Púnjí, and in the selected area in the vicinity of Jowái, which comprises the following seven villages: —Jowái, Nongbah, Nartiang, Mynsau, Amwí, Ralliang, and Shampúng. This selected area has a population of 12,504. Each village forms a distinctly-circumscribed community, in which the statistics are readily ascertained and reported by the *dolloi* or head-man. The returns may be regarded as extremely close to the truth, both for births and deaths; and they thus furnish an approximate statement of the health of the entire Hills. In 1874 the total number of deaths in the selected area was 351, showing a death rate of 28 per thousand; the number of births was 431, or 34·4 per thousand. The total population of all the places in which vital statistics are collected is 15,458 persons, among whom 428 deaths were recorded in 1874, showing a death-rate of 27·6 per thousand, as compared with 27·3 per thousand in the preceding year. The deaths were thus distributed—24 from cholera, 296 from fever, 38 from bowel complaints, 2 from snake-bite or wild beasts, and 68 from all other causes. The mortality from fevers was the highest recorded throughout the entire Province. On this the civil surgeon observes:—'There are few local sources of malaria in the Hills. Many of the deaths from fever were probably due to typhoid, induced by the use of impure water and by the filthy state in which the
312 people live. There is no attempt at conservancy in a Khási village.
364 In Jowái, a good specimen of the class, the lanes and pathways are
164 strewn with excrement and house refuse. Drinking water is got from wells in the heart of the village, fed by the drainage of the

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

312 •

surface soil of the hills upon which the houses are built.' Cholera is attributed to importation from the plains. 364 [164]

SANITATION.—It has already been stated that the ordinary Khási villages are absolutely destitute of any conservancy arrangements. The sanitary condition, however, of the Station of Shillong is described as 'good.' The natural drainage is excellent. Drinking water is obtained chiefly from hill streams, and on the banks of these streams conservancy regulations are enforced. The water is conducted into the town by means of an artificial water-course. Public latrines have been erected at suitable places inside the town. The staff of sweepers and *beldárs* keeps the roads and drains clean, and the surface generally free from pollution. The sanitary condition of the cantonment is reported to be very good.

CHARITABLE DISPENSARY.—There is one dispensary in the Khási and Jáintiá Hills—at the Station of Shillong. It was first opened in 1872, and considerable additions have since been made to the building. During 1874 a total sum of Rs. 775. 8, or £77, 11s., was expended on new constructions and repairs, towards which the European residents subscribed Rs. 329. There is now accommodation for 10 male and 3 female patients. In that year the total number of in-door patients treated was 44, of whom 9 died, giving a death-rate of 20·45 per cent. The number of out-door patients was 529, or an average daily attendance of 7·8. Of the grand total of patients of both classes, only 31 were females. The largest number of cases are classified under the headings of fevers and constipation and colic. The total income during the year was Rs. 1598. 13. 9, or £159, 17s. 8d., of which Government contributed Rs. 300 for salaries, and an additional Rs. 300 as a special allowance. The European subscriptions amounted to Rs. 869, as compared with Rs. 33 subscribed by natives. The total expenditure was Rs. 1187. 15. 6, or £118, 16s., leaving a balance in hand of Rs. 410. 14. 3. The chief items were Rs. 480 for salaries of medical subordinates, Rs. 160 for servants' wages, and Rs. 222 for dieting of sick. There were 53 minor operations performed during the year. 743 [164]

The people of the District have no system of medicine of their own, and no native practitioners. Their sole remedies consist in divination and incantation. The only indigenous native drugs are chireta and wormwood. As stated in a previous paragraph, a small cinchona plantation was established by Government at Nongklao in 1867. 755 278 648 654

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Silver chains are worn by men as well as by women. The 301
men wear them round the waist like a belt, and the women hang them round their necks, the chains being allowed to depend as low as the waist. Bracelets are worn by women; these are either of gold or of silver. The Lynngam [321]
males wear bead necklaces, the beads being sometimes of cornelian gathered from the beds of the local hill streams, and sometimes of glass obtained from the plains markets of Damra and Moiskhola. The cornelian necklaces are much prized by the Lynngams, and are called by them *'pieng blei*, or gods' necklaces. Like the Garos, the Lynngams wear as many brass earrings as possible, the lobes of the ears of the females being frequently greatly distended by their weight. These earrings are made out of brass wire obtained from the plains markets. The Lynngams wear silver armlets above the elbow and also on the wrists. It is only a [554]
man who has given a great feast who can wear silver armlets above the elbows. These armlets are taken off as a sign of [765]
mourning, but never on ordinary occasions. The Lynngams do not wear Khasi jewellery, but jewellery of a pattern to be seen in the Garo Hills. A distinctive feature of the Lynngam women is the very large number of blue bead necklaces they wear. They put on such a large number as to give them almost the appearance of wearing horse collars. These beads are obtained from the plains markets, and are of glass. Further detailed information regarding this subject can be obtained from Mr. Henniker's monograph, which contains a good plate illustrating the different articles of jewellery.

WEAPONS.

The weapons of the Khasis are swords, spears, bows and arrows, 411
and a circular shield which was used formerly for purposes of 314
defence. The swords are usually of wrought iron, occasionally of [326]
steel, and are forged in the local smithies. The Khasi sword is of considerable length, and possesses the peculiarity of not having a handle of different material from that which is used for the blade. In the Khasi sword the handle is never made of wood or bone, or

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

411 of anything except iron or steel, the result being that the sword
314 is most awkward to hold, and could never have been of much use as a weapon of offence.

The same spear is used for thrusting and casting. The spear is not decorated with wool or hair like the spears of the Naga tribes, but it is nevertheless a serviceable weapon, and would be formidable in the hand of a resolute man at close quarters. The length of the spear is about 6½ feet. The shaft is generally of bamboo, although sometimes of ordinary wood. The spear heads are forged in the local smithies.

The Khasi weapon *par excellence* is the bow. Although no 'Robin Hoods," the Khasis are very fair archers, and they use the bow largely for hunting. The Khasi bow (*ka ryntieh*) is of bamboo, and is about 5 feet in height. The longest bow in use
[141] is said to be about the height of a man, the average height amongst the Khasis being about about 5 feet 2 inches to 5 feet 4 inches. The bowstring is of split bamboo, the bamboos that are used being *u spit*, *u shken*, and *u siej-lieh*.

The arrows (*ki khnam*) are of two kinds: (*a*) the barbed-headed (*ki pliang*), and (*b*) the plain-headed (*sop*). Both are made out of bamboo. The first kind is used for hunting,
[526] the latter for archery matches only. Archery may be styled the Khasi national game. A description of Khasi archery will be found under the heading "Games." The feathers
[825] of the following birds are used for arrows:—Vultures, geese, cranes, cormorants, and hornbills. Arrow-heads are made of iron or steel, and are forged locally. The distance a Khasi arrow will carry, shot from the ordinary bow by a man of medium strength, is 150 to 180 yards. The Khasi
[237] shield is circular in shape, of hide, and studded with brass or silver. In former days shields of rhinoceros hide are said to have been used, but nowadays buffalo skin is used. The shields would stop an arrow or turn aside a spear or sword thrust. The present-day shield is used merely for purposes of display.

389 Before the advent of the British into the hills the Khasis are said to have been acquainted with the art of manufacturing gunpowder, which was prepared in the neighbourhood of Mawsanram, Kynchi, and Cherra. The gunpowder used to be

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

In former years the Khásiás were great iron-smelters, and enormous excavations in the most favourable localities for obtaining ironstone prove the extent to which this manufacture was carried on. In some places the whole surface of the ground appears to have been dug up for a depth of several feet, leaving huge boulders standing up here and there. Of late years, however, as the price of labour in the Hills has risen, the trade in iron has died away, and there is now little demand for the Khásí article, the cheaper English metal having driven it out of the market. 178 316 325

NATURAL PHENOMENA.—Many peculiar caves and caverns are found in the limestone rock formation, the most notable being the caves at Cherrá Púnjí and at Rúpnáth in Amwi. At the latter place the caverns extend a great distance beneath the earth, one being imagined by the people to reach as far as China, and a Hindu legend states that a Chinese army once marched by this route to the invasion of India. In another cave, the limestone stalactites have been carved into images representing the gods of the Hindu pantheon. On the banks of the Kapilí river on the Cáchár border, at a place called Sumir, there is a hot spring, the water of which contains carbonate of lime. All the rivers in the Hills flow through gorges in certain parts of their course, the most picturesque being at Tehriá, where a small stream is compressed into deep pools among limestone rocks; and at Darrang and Borghát, where the Mangat and Mantideo rivers respectively debouch upon the plains. 133 [823]

FORESTS, ETC.—The India-rubber or caoutchouc tree is found in many forests throughout the Hills, but not in great numbers, and the supply and value of the gum has much decreased of late years. In 1870 the right of tapping the trees in the Jáintiá Hills was leased out for a sum of £36, 12s. 0d.; but by 1876 the trade had almost entirely ceased. There are some tracts of timber forest on the lower hills towards the Brahmaputra valley, but through the want of water carriage they are of no great value. Vigorous efforts are being made to preserve the forests in the higher plateaux. Owing to the habit of firing the jungle in spring prior to sowing, great waste of valuable timber has taken place; but since the country has been separated from Bengal and placed under the administration of the Chief Commissioner of Assam, attention has been given to the matter, and special areas are now being set apart for the preservation and growth of forest timber. Cinnamon grows wild in some parts of the country. There is a considerable trade carried on in 137 [314] 137 648 659 000

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

the ground, and well oiled. A silver ornament, or a few rupees, 524
placed at the top, reward the successful climber." A leg of mutton, or a piece of pork fixed at the top of this pole would render the pastime identical with the "greasy-pole" climbing of English villages. The following are some other Khasi games:—

526
Wrestling; two persons grasping each other's hands with the 527
fingers interlocked, and then trying to push one another down; tug-of-war with a piece of stick, the two combatants placing their feet one against the other; butting at one another like bulls, and trying to upset each other (*ia tur masi*); long jump; high jump; blind-man's buff; flying kites; pitching cowries into a hole in the ground; a game like marbles, only played with round pebbles, and others.

MANUFACTURES.

The manufactures of the Khasis are few in number, and do 327
not seem to show any tendency to increase. On the contrary, 288
two of the most important industries, the smelting of iron ore 412
and the forging of iron implements therefrom, and the cotton-spinning industries at Mynso and Suhtnga, show signs of dying out. Ploughshares and hoes and bill-hooks can now be obtained more cheaply from the plains than from the forges in the hills, and Manchester piece goods are largely taking the place of cloths of local manufacture. The iron industry in 327
former days was an important one, and there is abundant 316
evidence that the workings were on a considerable scale, e.g. at Nongkrem and Laitlyngkot, in the shape of large granite boulders which have fallen to the ground from the sides of the hills owing to the softer rock which filled the interstices between the boulders having been worked out by the iron-workers, their process being to dig out the softer ferruginous rock, and then extract the iron ore from it by means of washing. The softer rock having been removed, the heavier portions fell by their own weight, and rolled down to the bottom of the slopes, the result being the great number of boulders to be seen near the sites of these workings.

10: Clarke U-3 (no date)1874 AR7 Khasi AR7

in these hills a dozen monuments on the binary type may soon be found in which there are two equal upright slabs in the middle, and the other stones placed symmetrically on each side of them.

7. There are three kinds of rock employed by the Khasis for stone monuments, viz.:—

a. The Cherra sandstones.
b. The Shillong sandstones.
c. The granite.

Small stones are conveyed considerable distances from the place of manufacture before they are set up—large stones are not—hence the material of the monuments is determined everywhere geologically.

a. The Cherra sandstones are tertiary and cretaceous rocks spread along the southern edge of the plateau and producing the ledges which mark its abrupt termination. In the great thickness of these sandstones are many beds in which the rock occurs in large sheets with very few joints, and well-adapted for working out large slabs therefrom. The sandstone is generally very hard, but not so hard but that the Khasis can work it with their own native-made iron tools.

There is a quarry, now in full work, about half-a-mile out of the old Cherra cantonment, upon the Mamloo path, where slabs may be seen in preparation. The slabs made from the Cherra sandstones, admitting of being worked, are generally hewn pretty fairly to a shape and smoothed before being set up. The ancient monuments are, however, often made of very rough slabs.

All the well-known monuments near the old Cherra station are made of these sandstones, as also the large monuments at Mamloo, Maurmai, and Lirinow. These three monuments all stand on sheets of Cherra sandstone and the stones were cut out of the rock hard by where they now stand. The stones quarried now outside the Cherra cantonment, being for transport, are none of great size.

The Khasis also work gigantic slabs of stone for bridges. Where the span is anything under twenty feet a single slab four or five feet wide and two feet thick is thrown across; piers of enormous blocks of sandstone are raised on each side, on which the slab may rest, if there is the remotest fear that the water can, in any flood, reach the under surface of the slab. As compared with such a bridge the Khasis regard the best efforts of the English engineers as mere makeshifts. The arch at Amwee, figured by Dr. Hooker is Bengali work.

b. The Shillong sandstones extend over a large area of the northern portion of the plateau: they are often more argillaceous

10: Clarke U-3 (no date)1874 AR7 Khasi AR7

in East Jaintia, according to the Khasis, who are good geologists. 135

These granite blocks are found on the steep hill sides and on the hill tops, the valleys between being often entirely destitute of them. The highest hills of the plateau are especially favoured with them as Nongtas (Nunklow) and Laitlankote. On the edges of the granite area and on the isolated peaks of the country, outlying heaps of granite blocks are found. Around *Jowya* (the *Jaintia* capital), the country is very uniformly at a level of about 4000-4500 feet above the sea, and not a granite block is to be seen there, nor in marching east thence, where you keep at the same level, until you reach the Ralliang hill about twelve miles east of *Jowya*, where the blocks appear again in full force all over the summit of the hill.

From these granite blocks, slabs of almost any size might be obtained, but the Khasi native iron tools will not work this granite, which is very hard, and the granite slabs used in the Khasi monuments are merely flakes obtained by heating the block with fire along a line and then pouring cold water upon it. The upright granite slabs thus frequently exhibit one convex and one concave face, as also do the horizontal slabs which are round or oval, not quadrangular. The flakes are entirely unworked in the Khasi territory, so that the granite monuments have an extreme rudeness and ruggedness about them which has been commonly supposed to indicate extreme antiquity. This I believe is altogether a mistake, but at the present time the taste of the people appears educated up to a preference for worked stones, and I have not seen any granite monument in process of construction, though I am told that many have been made within the memory of men. 316

There is an important difference in the *Jaintia* granitic monuments which are neatly worked to the approved form. The Bengali Rajahs of the plains *Jaintia* and *Jaintiapore*, have long established an influence in the hills, and Bengali workmen have thus penetrated the hills from *Jaintiapore* by *Amwee* up to *Jowya*, the hill capital, and further. The Bengali tools are able to fashion this hard granite, and the gigantic slabs, whether used for monuments or for bridges, are commonly found neatly hewn, all the way from *Jaintiapore* up to *Nartiang*, north of *Jowya*.

Large granite stones are rather more difficult to move than sandstones of the same dimensions, and the first class granite monuments are found on the spot where the granite blocks abound. Where an isolated hill was covered with large blocks, and no blocks were seen anywhere else near, this seems at once to have suggested such a hill as a suitable spot for monumental erections. In just the same way at Stonehenge the large stones

10:Clarke U-3 (no date)1874 AR7 Khasi AR7

316 were all found within 200 yards of where they now stand, as may be inferred from the stray stone at about that distance from Stonehenge and not made use of: the small stones were probably brought a considerable distance from the greensand area in the north of the county.

316 8. In the setting up of these monuments the Khasis at the
415 present day use only the simplest and most direct mechanical means. For transporting a big stone wooden rollers are placed beneath it and the stone is then drawn by a large number of men harnessed to it by rattan ropes. To set one of the slabs upright, one end is slipped into a hole dug 1-3 feet in the ground, while the other end is tugged by similar ropes. For putting one stone upon another, as in a horizontal slab monument, it is drawn up a sloping stage of bamboo, but if the slab be of great weight, a slope of earth must be constructed, up which it may be pulled. These are the present Khasi methods, and it is, of course, highly probable that similar resources were employed in ancient times. I add a more particular account of some of the larger monuments.

311 9. The monument on the Government main road, about six miles north of Cherra, not far from the village of Lirinow, stands on sheets of Cherra sandstone, out of which the slabs were cut. The tallest stones were about fifteen feet out of the ground. The five stones on the left-hand side (west) of the road were erected when I first visited the hills. The five stones on the right-hand side were erected about four years ago, the family to whom the monument belongs having determined on such an addition. The two portions form one indivisible monument, and exactly correspond, the stones being accurately worked and rounded. The two top-knots are seen in several other monuments, but must, I think, be held proof always of a very late date for their erection. At the Mausmai
[39] monument a large rosette is carved on the face of the middle of the big central upright slab, which is also I presume modern work.

10. The monument at Mamloo village. This is, perhaps, the monument in all the hills which exhibits the largest slabs of Cherra sandstone. It stands on sheets of the same rock and there can be little doubt that the slabs were cut on the spot. It is of the (less usual) binary type.

11. The monuments at Rambrai in the west of Khasi-land. These consist of numerous horizontal and vertical slabs of no great size, the upright slabs being 4-8 feet out of the ground, but remarkable for their arrangement on a long open slope outside the village. The monuments stand all close together, collected as in a churchyard, so that it is not easy to separate

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

vation is impossible because of the cold climate. In the past, Khasi economy must have remained at a very primitive stage. 178 244

Potato cultivation has been much encouraged along with the development of Shillong and the opening of the motor road to Gauhati from Shillong after the Independence of India when Shillong became the seat of the Assam Government, as well as the capital of the Khasi-Jaintia Hills. Shillong has become an important trading centre, where big merchants collect the harvests of potatoes in exchange for rice, clothes and various other goods from the Assam valley. These changes have introduced the Khasis into an active commercial economy which again has brought about various changes in their social life. Recently coal excavations have started in the upland Khasi Hills, and many Khasi become miners. 178 433 369 [244] [633] [491] [439] [316]

Thus the history of the Khasi Hills during the last hundred years has changed a great deal the picture of the Hills. However, dark corners still remain in Bhoi, War and in the area bordering on the Garo Hills. These have been kept in a vacuum between the Hindu civilization of the bordering plain and the modernization of the uplands centred in Shillong. In these areas, the people are still practising primitive jhum cultivation. I have chosen two villages in War located in one of these area as subjects of my major field-work. 178 184

[P. 100 is blank]

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmiller 1924a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

In former years the Khásiás were great iron-smelters, and enormous excavations in the most favourable localities for obtaining ironstone prove the extent to which this manufacture was carried on. In some places the whole surface of the ground appears to have been dug up for a depth of several feet, leaving huge boulders standing up here and there. Of late years, however, as the price of labour in the Hills has risen, the trade in iron has died away, and there is now little demand for the Khásí article, the cheaper English metal having driven it out of the market. 178 316 325

NATURAL PHENOMENA.—Many peculiar caves and caverns are found in the limestone rock formation, the most notable being the caves at Cherrá Púnji and at Rúpnáth in Amwi. At the latter place the caverns extend a great distance beneath the earth, one being imagined by the people to reach as far as China, and a Hindu legend states that a Chinese army once marched by this route to the invasion of India. In another cave, the limestone stalactites have been carved into images representing the gods of the Hindu pantheon. On the banks of the Kapilí river on the Cáchár border, at a place called Sumir, there is a hot spring, the water of which contains carbonate of lime. All the rivers in the Hills flow through gorges in certain parts of their course, the most picturesque being at Tehriá, where a small stream is compressed into deep pools among limestone rocks; and at Darrang and Borghát, where the Mangat and Mantideo rivers respectively debouch upon the plains. 133 [823]

FORESTS, ETC.—The India-rubber or caoutchouc tree is found in many forests throughout the Hills, but not in great numbers, and the supply and value of the gum has much decreased of late years. In 1870 the right of tapping the trees in the Jáintiá Hills was leased out for a sum of £36, 12s. 0d.; but by 1876 the trade had almost entirely ceased. There are some tracts of timber forest on the lower hills towards the Brahmaputra valley, but through the want of water carriage they are of no great value. Vigorous efforts are being made to preserve the forests in the higher plateaux. Owing to the habit of firing the jungle in spring prior to sowing, great waste of valuable timber has taken place; but since the country has been separated from Bengal and placed under the administration of the Chief Commissioner of Assam, attention has been given to the matter, and special areas are now being set apart for the preservation and growth of forest timber. Cinnamon grows wild in some parts of the country. There is a considerable trade carried on in 137 [314] 137 648 659 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

The coal strata at the former place are calculated to extend over one-third of a square mile, with an average thickness of from 3 feet 6 inches to 4 feet; and the yield of the coal, if it could be worked, is estimated at 447,000 tons. At the latter spot the area of the coal-fields is computed to extend over 0·394 of a square mile, and the estimated yield of the mineral is about 1,100,000 tons. The coal at Cherrá Púnjí and at Lá-ká-dong is in quality equal to some English coals; it is quick in its action, and consequently would generate steam rapidly; it cakes well, but gives out a large amount of smoke; it is fragile and easily broken. From the absence of that definite structure which produces the planes of division known to English miners as 'backs,' or joints in the coal, it breaks into unsymmetrical pieces, and consequently does not stow well. From its composition, quick combustion, and irregular cleavage, it is estimated to be from 5 to 7 per cent. inferior to good English coal; but as a gas-producing coal it is considered superior to English produce, both as regards quality and purity of the gas. It is also calculated to yield a good quality of coke. The market value of coal found in the Khási and Jáintiá Hills cannot be given with any approach to accuracy, owing to the expense of labour in the Hills and of carriage to the plains. The Station of Shillong, which consumes coal as fuel, derives its supply from the coal beds at Máo-beh-lyrkár, 18 miles distant, and the price is as high as £3 per ton. Lá-ká-dong is within six miles of Borghát, a village on an affluent of the Surmá, which is accessible all the year round by boats of 500 maunds, or 28 tons burden; but at present only coolie-carriage is available between Lá-ká-dong and Borghát.

The following is a brief history of the mines at Cherrá Púnjí in the Khási Hills, and at Lá-ká-dong in the Jáintiá Hills:—Government holds a perpetual lease of the Cherrá Púnjí mines from the chief or Siem of Cherrá, conditionally upon the payment by Government of a royalty of two shillings and eightpence for every five tons of coal quarried and removed from the mine, and also upon the terms that the people of Cherrá shall be permitted to work the beds on their own account. In 1844 Government transferred its right to work the mine to Captain Engledue, then agent of the Peninsular and Oriental Company, for a period of twenty years; but in the following year this gentleman, with the permission of Government, made over his lease to Messrs. Gisborne & Co., of Calcutta, who worked the mine for about two years,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

316 and in 1851 transferred their rights to Mr. W. Moran, of Calcutta.
648 The last lessee, however, preferred buying his coal to mining it; and
655 Government, seeing that the mines were not worked in a satisfactory manner, resumed the beds in 1859, and advertised them for letting. No person, however, has since come forward to work the mine. The Lá-ká-dong coal mines are the sole property of Government, which in the year 1848 leased the mining rights to Mr. B. W. Darley. This gentleman in the following year made over his lease to Messrs. Gisborne & Co., who soon afterwards transferred it to Mr. Moran. This gentleman surrendered his lease in 1859, when the mines were advertised for letting, but no one has since come forward and undertaken to work the coal. Between 1850 and 1856, while the mines were worked, about 5100 tons of coal were extracted for exportation.

In Mr. Allen's Report, dated 1858, it is stated that the coal of the Hills then found a ready sale at Dacca and elsewhere at 8 *ánnás* per *maund*; and that the average quantity exported into Bengal was about
[435] 25,000 *maunds*, valued at Rs. 12,500, or £1250. According to the local trade reports, this exportation would appear to have entirely died out; but the Bengal registration returns record 2965 *maunds* of coal, valued at Rs. 1482, or £148, at the rate of 8 *ánnás* per *maund*, as exported from Sylhet District in the year 1876-77. This supply was probably derived from the Khásí and Jáintiá Hills.

317 LIMESTONE QUARRIES.—A limestone formation prevails more or less along the whole southern face of the Khásí and Jáintiá Hills. The quarries are chiefly situated in the beds and on the banks of rivers and water-courses.

The limestone-quarrying localities in the Khásí Hills are the following twenty-six:—(1) Bha-wál; (2) Bor-syr-mai; (3) By-rang, *alias* Wáh-long; (4) Bor-púnjí; (5) Chún-jurá; (6) Dholai; (7) Dwárá; (8) Ichhámati; (9) Lúm-dih-long; (10) Lan-grin; (11) Long-long; (12) Máo-nai; (13) Máo-don; (14) Máo-kár-tillá; (15) Mohesh-kháli; (16) Máo-long; (17) No-kriá; (18) Páthériá; (19) Ram-seng-rai-skeh; (20) Soh-lai; (21) Silai; (22) Shellá; (23) Tanglá; (24) Tang-wai; (25) Um-song; (26) Um-tymá. In the Jáintiá Hills, the following seven:—(1) Chún-chhorá; (2) Lámá-pushi; (3) Lithánq; (4) Myrli Púnjí; (5) Nongthá-long; (6) Rúpnáth; (7) Rowai. The supply of limestone is literally inexhaustible. The wants of Calcutta and of the whole of Lower Bengal
648 have been satisfied from these hills from time immemorial. During
651 the year 1876-77 the estimated export was 1,600,000 *maunds*, valued
317

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

434

against Rs. 25,000, or £2,500, twenty years earlier. The supply of 439
piece-goods is derived directly from Dacca.

A curious feature in the trade of the Khásí and Jáintiá Hills is 441
the total absence of Márwárí or Jain merchants—an enterprising class, who are found everywhere else in Assam, even to the farthest corners of the Brahmaputra valley. There are a few Bengálí traders from Dacca, who do not take up a permanent residence in the Hills; but the great bulk of the business remains in the hands of the natives, who themselves reap the profits and are said to be keen at a bargain.

The principal markets at the foot of the Hills, on the Sylhet side, 443
are Bholáganj, Chhaták, Lakhát, Jaíntiápur, Jafling, Pharálbázár, Máodong, Ponatit, Sónápur, Molághul, and Lengjut. Many of these are situated within the Sylhet boundary; but they are all frequented by Khásí and Synteng traders, who spend their whole time in passing from one market village to another. The markets or *háts* are held at regular intervals of eight days (for the Khásí week consists of this number), with the object of permitting the same people to visit the different places in rotation.

CAPITAL.—Such little capital as the people possess is either 454
employed in trade or lent out upon interest. In a few cases it is hoarded and allowed to remain idle. In small loan transactions, whether articles are pledged as security or not, the interest usually charged is one *dnná* in the rupee per month, or 75 per cent. per annum. In larger transactions the rate of interest per month varies from 2 to 3 per cent. Nothing is charged in the name of interest where lands are mortgaged as security for a loan, as the land is always made over to the mortgagee in lieu thereof, and he is only bound to restore it on payment of the amount lent. In petty advances for agricultural purposes, part of the produce is given by the cultivator at something less than market rates in repayment of the amount borrowed. Limestone quarrying is the only industry in 316
the District carried on by European agency. 648

REVENUE AND EXPENDITURE.—The revenue realized from the 648
Khásí and Jáintiá Hills has increased considerably in recent years. 651
As the Khásí States are treated as semi-independent, the receipts from that portion of the District are altogether insignificant, with the exception of the dues levied from the lime quarries. The larger part of the revenue in Jáintiá is derived from the house tax. For 1835, when British authority was first established in the Khásí Hills,

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

316 and in 1851 transferred their rights to Mr. W. Moran, of Calcutta.
648 The last lessee, however, preferred buying his coal to mining it; and
655 Government, seeing that the mines were not worked in a satisfactory manner, resumed the beds in 1859, and advertised them for letting. No person, however, has since come forward to work the mine. The Lá-ká-dong coal mines are the sole property of Government, which in the year 1848 leased the mining rights to Mr. B. W. Darley. This gentleman in the following year made over his lease to Messrs. Gisborne & Co., who soon afterwards transferred it to Mr. Moran. This gentleman surrendered his lease in 1859, when the mines were advertised for letting, but no one has since come forward and undertaken to work the coal. Between 1850 and 1856, while the mines were worked, about 5100 tons of coal were extracted for exportation.

In Mr. Allen's Report, dated 1858, it is stated that the coal of the Hills then found a ready sale at Dacca and elsewhere at 8 *dnnás* per *maund;* and that the average quantity exported into Bengal was about
[435] 25,000 *maunds*, valued at Rs. 12,500, or £1250. According to the local trade reports, this exportation would appear to have entirely died out; but the Bengal registration returns record 2965 *maunds* of coal, valued at Rs. 1482, or £148, at the rate of 8 *dnnás* per *maund*, as exported from Sylhet District in the year 1876-77. This supply was probably derived from the Khásí and Jáintiá Hills.

317 LIMESTONE QUARRIES.—A limestone formation prevails more or less along the whole southern face of the Khásí and Jáintiá Hills. The quarries are chiefly situated in the beds and on the banks of rivers and water-courses.

The limestone-quarrying localities in the Khásí Hills are the following twenty-six:—(1) Bha-wál; (2) Bor-syr-maí; (3) By-rang, *alias* Wáh-long; (4) Bor-púnjí; (5) Chún-jurá; (6) Dholai; (7) Dwárá; (8) Ichhámati; (9) Lúm-dih-long; (10) Lan-grin; (11) Long-long; (12) Máo-nai; (13) Máo-don; (14) Máo-kár-tillá; (15) Mohesh-kháli; (16) Máo-long; (17) No-kriá; (18) Páthériá; (19) Ram-seng-rai-skeh; (20) Soh-lai; (21) Silai; (22) Shellá; (23) Tanglá; (24) Tang-wai; (25) Um-song; (26) Um-tymá. In the Jáintiá Hills, the following seven:—(1) Chún-chhorá; (2) Lámá-pushi; (3) Litháng; (4) Myrli Púnjí; (5) Nongthá-long; (6) Rúpnáth; (7) Rowai. The supply of limestone is literally inexhaustible. The wants of Calcutta and of the whole of Lower Bengal
648 have been satisfied from these hills from time immemorial. During
651 the year 1876-77 the estimated export was 1,600,000 *maunds*, valued
317

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

at Rs. 480,000, or £48,000, and the revenue derived by Government from the quarries was Rs. 67,266, or £6726. In addition, the Khási Chiefs receive a revenue from this source of more than £2000. 648 651 317

IRON.—The smelting of iron was once the chief industry in the Khási Hills, and a considerable quantity of the metal used to be exported into Sylhet, both in the crude and the manufactured state. Recently, however, this industry has almost died out, in the face of the competition of the superior article imported from England and sold in the plains at a cheaper rate. The indigenous methods of extracting, washing, and smelting the ore have been minutely described by Professor Oldham. The following description is taken from Mr. Allen's Report, dated 1858, at which date the annual export of smelted iron was estimated at 45,000 *maunds*, valued at Rs. 67,500, or £6750, at the rate of Rs. 1. 8 per *maund*: —'The ore is said to be most abundant and of the best quality in the State of Khyrim, especially at the villages of Nongkrím and Noyandri. A few iron articles, such as *dáos* or hill knives, *koddlis* or mattocks, spear and arrow-heads, are manufactured by the Khási smiths in the Hills; but the greater bulk of the smelted iron is sent to the plains for sale in circular lumps weighing about 4 or 5 *sers*. These lumps, called *bírú*, sell at Chhaták for from Rs. 1. 4 to Rs. 1. 6 per *maund*. The best iron, however, which is beaten into bars called *peti*, sells for from Rs. 1. 10 to Rs. 1. 12 per *maund*. Khási iron is preferred to English, in consequence of its greater malleability. It is much used by the native boat-builders of Sylhet and the neighbouring Districts to make fastenings for the timbers of their boats. When brought into the market, it is more than half dross, and it is this circumstance which renders the iron trade unprofitable. The cost of carriage from the Hills to the plains is about 6 *ánnás* per *maund*; and the traders, who are all Khásiás themselves, affirm that they get an average profit of only 2 *ánnás* per *maund*.' The tables of trade for 1876-77 return no smelted iron as exported from the Hills, but Rs. 7000 of iron implements exported, against nails and ironmongery imported to the value of Rs. 18,000. 178 325 439 [326] [435] [501]

THE MANUFACTURES of the District, besides iron, consist of coarse cotton and *randia* cloth, plain silver work, rude implements of husbandry, netted bags made of the fibre of the pine-apple, common pottery, and mats and baskets. With the exception of the 28 433

and even the well to do ones do not feel anything to work as labourers in other's farms. It is almost customary among the agriculturists to work in other's farms on wage basis, when agricultural operation in one's own farm are over. This is probably an outcome of the difficult transport situation. Among the non-agriculturists and those who follow agriculture as subsidiary occupation, a large number are porters and labourers engaged in jobs like transporting of goods from place to place, collection of limestone, sand, fuel, Collieries and forests of the district also offer employment to a good number of people. Since the taking up of road programme under the plan, a large number of people are getting employment in construction of roads, etc. It is heartening to note that for construction of roads, nay for all kinds of works demanding unskilled labourers, the district locally supplies the whole labour force. People in the various local points of the district, particularly those living in higher hills are mainly engaged in trade. The Khasis are indefatigable traders and have been able to keep almost the whole of the small trade in the district in their own hands. A small proportion of the people are engaged in cottage industries such as stone cutting, brick making, bee keeping, blacksmithy, cane and bamboo works, etc.

The number of persons returned in the 1951 census under each of the eight main livelihood classes for the rural tract of the district was as follows.

TABLE 1

Number of Persons (Source 1951 Census)

Head	Male	Female	Total	P.C.
(1)	(2)	(3)	(4)	(5)
A. Agricultural class:—				
1. Cultivators of land wholly or mainly owned and their dependents.	90,603	92,107	1,82,710	59·89
2. Cultivators of land wholly or mainly unowned and their dependents.	16,014	16,109	32,123	10·53
3. Cultivating labourers and their dependents.	14,053	14,941	28,994	9·50
4. Non-cultivating owners of land, agricultural rent receivers and their dependents.	344	562	906	·30
Sub-total	1,21,014	1,23,719	2,44,733	80·22
B. Non-agricultural class:—

Total	..	..	3,05,087	100.00

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Silver chains are worn by men as well as by women. The men wear them round the waist like a belt, and the women hang them round their necks, the chains being allowed to depend as low as the waist. Bracelets are worn by women; these are either of gold or of silver. The Lynngam males wear bead necklaces, the beads being sometimes of cornelian gathered from the beds of the local hill streams, and sometimes of glass obtained from the plains markets of Damra and Moiskhola. The cornelian necklaces are much prized by the Lynngams, and are called by them *'pieng blei*, or gods' necklaces. Like the Garos, the Lynngams wear as many brass earrings as possible, the lobes of the ears of the females being frequently greatly distended by their weight. These earrings are made out of brass wire obtained from the plains markets. The Lynngams wear silver armlets above the elbow and also on the wrists. It is only a man who has given a great feast who can wear silver armlets above the elbows. These armlets are taken off as a sign of mourning, but never on ordinary occasions. The Lynngams do not wear Khasi jewellery, but jewellery of a pattern to be seen in the Garo Hills. A distinctive feature of the Lynngam women is the very large number of blue bead necklaces they wear. They put on such a large number as to give them almost the appearance of wearing horse collars. These beads are obtained from the plains markets, and are of glass. Further detailed information regarding this subject can be obtained from Mr. Henniker's monograph, which contains a good plate illustrating the different articles of jewellery.

301 [321] [554] [765]

WEAPONS.

The weapons of the Khasis are swords, spears, bows and arrows, and a circular shield which was used formerly for purposes of defence. The swords are usually of wrought iron, occasionally of steel, and are forged in the local smithies. The Khasi sword is of considerable length, and possesses the peculiarity of not having a handle of different material from that which is used for the blade. In the Khasi sword the handle is never made of wood or bone, or

411 314 [326]

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

415 like a pendulum. An explanation of this method of divination
787 will be found in the paragraph dealing with divination.

There is also a pair of squeezers used by the old and
412 toothless for breaking up betel-nut. In the houses of the
415 well-to-do is to be seen the ordinary hubble-bubble of
● 322 India. Outside the houses of cultivators are wooden troughs hollowed out of the trunks of trees, which are used either as drinking troughs for cattle or for feeding pigs. A special set of utensils is used for manufacturing liquor. The Synteng and Wár articles of furniture and utensils are the same as those of the Khasis, with different names, a remark which applies
415 also to those of the Bhois and Lynngams. Both the latter,
824 however, use leaves as plates, the Bhoi using the wild plantain and the Lynngam a large leaf called *ka 'la mariong*. The leaves are thrown away after eating, fresh leaves being gathered for each meal. The Lynngams use a quilt (*ka syllar*) made out of
513 the bark of a tree of the same name as a bed covering. This
824 tree is perhaps the same as the Garo *simpak*. In the Bhoi and Lynngam houses the swinging shelf for keeping firewood is not
417 to be seen, nor is the latter to be found amongst the sub-montane Bodo tribes in Assam.

MUSICAL INSTRUMENTS.

534 The Khasis have not many musical instruments, and those that they possess, with one or two exceptions, are of very much the same description as those of the Assamese. There are several kinds of drums, viz. *ka nákrá*, which is a large kettle-drum made of wood having the head covered with deer-skin; *ka ksing*, which is a cylindrically-shaped drum rather smaller than the Assamese *dhol* (*ka ksing kynthei* takes its name from the fact that this drum is beaten when women, *kynthei*, dance), *ka padiah*, a small drum with a handle made of wood; *katasa*, a small circular drum. Khasi drums are nearly always made of wood, not of metal, like the drums to be seen in the monasteries of Upper Assam, or of earthenware, as in Lower Assam.

Ka duitara is a guitar with *muga* silk strings, which is

Arrow Shooting and Hunting Customs of the Khasi
by P.F. Stegmiller, S.D.S., Apostolic Missionary
of Assam.

411

1. Arrow Shooting and Its Implements.

Corresponding to the general interest which is shown in arrow shooting, the tools that belong to this art are prepared with great skill and ability, (1) namely the bow, the arrow, and

1. Hermann Meyer, Pfeil und Bogen in Zentralbrasilien, (Leipzig, 1895), p. 16. [Bows and Arrows in Central Brazil].

the target.

411 922 A kind of bamboo with many knots is used for the Khasi bow (ka rynthieh), and it is cut out in one piece so that there are at least five knots on the bow. The length of the bow is about 1.5 meters. It is not a matter of indifference how long the bow is. The best shots claim that the bow must be made to measure and must be made shoulder height. The size of the man determines the size of the bow. (2)

2. Bruno Adler, Internationales Archiv für Ethnographie, [International Archive for Ethnography] Vol. 14, Supplement: "Der nordasiatische Pfeil", [The North Asian Arrow], p. 14: "The long arrow of the Japanese corresponds to the longest bow which we find in Asia-phenomena which are in the grossest contrast to the small figure of the Japanese."

Fig. I

When a strong bamboo with many knots is found, it is cut off and split after the length has been determined. The outside of the bow in smaller bows is rounded off; (3) 411 322

3. Illustration I, fig. 1c.

for the usual bows and the larger ones almost the full half of the bamboo is taken. A little is cut off only on the sides so that the profile of the bow nearly forms a right angle. (4) In each case the shiny

4. Illustration I, figs. 2,3,4c.

outer side of the bamboo becomes the inside of the bow. The bow becomes smaller towards the ends. The ends are rounded off. Underneath one end, about 3 centimeters from the end, a notch is made, into which the string is put directly without any other means of fastening. The string remains fastened by pulling the loop taut. At the other end of the bow a peg is cut, around which the string is hung just before the bow is used. Often both ends of the bow end in a point. (5)

5. Illustration I, fig. 1, 2b.

The bow must not be kept strung but must be unstrung when left unused for a while. Stringing the bow is always done in this way. The archer takes the bow in his left hand while standing, resting on the ground the end to which the string always remains attached, and then pressing down the other end with his right hand as far as is necessary to hang the loop of the string around 411 284

411 the peg. In many cases with bows with the
284 points indented the string is attached by means of a special loop of bast or split bamboo (u thri), tut it is also fastened directly by hanging around the peg. [608] [Illustration I. Khasi Bows. 1a, 1b, 1c, 2a, 2b, 2c, 3a, 3b, 3c, 3d, 3e, 4a, 4b, 4c]. [609] The bow is carved flat in the middle and a strip of reed palm is wound around it so that there is a band 12 to 15 centimeters wide around it. The purpose of this is to provide a surer grip, as the left hand, which carries the bow when shooting, gets a better grip on the ribbed foundation. In other places also, primarily at the ends of the bow, such reed strips are fastened and merely serve the purpose of ornamentation.

411 When the bow is completed, it is thoroughly
322 smoked. The smoking takes place in the hut. In the center of the hut a fire burns constantly in a hearth of earth or of stone, the smoke of which, since there is no vent or chimney, seeks a way out the best it can. Above the fire a swing is set up from the ceiling on which the wood lies for drying. The bow and also the string are left lying on this swing until the desired result occurs. Smoked bows are more resistant to dampness, longer lasting, and considerably tougher. The smoking has no effect on the flexibility of the bow. (6)

411

6.10 **Cottage Industries.**—It has already been mentioned that Village and Cottage Industries are not very popular in the district.

The following table shows the industries operated from the sample villages:—

TABLE 6-9

Industry (1)	No. of villages reporting existence of the industries (2)	No. of villages reporting production for sale (3)
Cane and bamboo works ...	9	7
Blacksmithy	5	5
Tailoring	5	2
Handloom	—	—
Weaving and Spinning ...	9	1
Bowing of cocoons, etc. ...	1	1
Bowing of lac	1	1
Others	9	1

Blacksmithy and making of baskets, cane products, etc., out of cane and bamboo, are a traditional occupation. Weaving and spinning of cotton, rearing of silk cocoon and rearing of lac, etc., are in vogue only in the Khasi area and the areas adjoining Kamrup and North Cachar and White Hill areas of the district. Lac rearing is found in the northern portion of the district, i.e., Mawsynram area.

Cottage cane and bamboo works and blacksmithy other industries are practised to a very limited scale. There is also a lot of scope for introducing cottage industries in the district.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

COTTON CLOTHS.

283 In the Jaintia Hills at Mynso cotton is spun into thread, and
288 weaving is carried on there, but on a limited scale. The Mynso people weave the small strips of cloth worn by the men to serve the purpose of the Assamese *lengti* or Hindi *languti*. In Suhtnga the people import cotton thread from Mynso and weave the (*ingki*) or sleeveless coat, peculiar to the district; these coats are dyed red and blue. The dark blue or black dye
824 is obtained from the leaf of a plant called *u sybu*, which
386 Mr. Rita has classified as *strobilanthus hoeditolius*, which
288 grows in the gardens round the homesteads. The leaves are dried, then reduced to powder, mixed with hot water, and the skeins of thread are steeped in the liquid. The colour is permanent. The red dye is obtained from the mixture of the dry bark of two shrubs, *ka lapyndong* (*symplocos racemosa*, Roxb.), and *ka 'larnong* (*morinda-tinctoria*, Roxb.), the latter being the same as the Assamese (আইচ্ছিথ) *ichchith*. The bark is dried, then pounded, and the two sorts are mixed together and made into a paste with hot water. The skeins are steeped in this mixture for twenty-four hours, then taken out and divided, and again steeped for another twenty-four hours. The Lalungs and Bhoi and Lynngams all weave cotton cloths, which are generally dyed blue, sometimes striped blue and red. The Wars weave cotton cloths which are dyed red and yellow, the cloths being woven in checks. Mr. Darrah remarks that the cotton grown in the Jaintia Hills is said to be the best cotton produced in the province. Its thread can be more closely woven than that of other kinds. This statement, however, is not borne out by Mr. Allen writing in 1858, who says that the cotton is of inferior quality, the staple being short and woolly. The cotton cloths woven by the Bhoi are called *epon*.

POTTERY.

[162] The Census Report of 1901 gave the number of persons who
323 are supported by the manufacture of pottery at 54 only. Pottery is manufactured at one place only in the Jaintia Hills,

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

323 **Larnai.** The Larnai potters make many of the earthen pots to be found in the Khasi houses called *khiew ranei*, or sometimes *khiew Larnai*. Mr. Gait says, "These potters use two kinds of clay mixed; one is of a dark blue colour, *'dew-iong*, and the other of a greyish colour, *'dew khluid*. These clays seem to correspond closely with the *kumár máti* and *hira máti* of the Brahmaputra Valley."

323 415 435 The clay at Larnai is well beaten out upon a hide, or upon a flat disc of wood; the women fashion the pots by hand, they do not use the potter's wheel. The pots are sun-dried and then fired. They are painted black with an infusion of a bark called *sohliya*. The Larnai potters also make flower-pots which are sold in Shillong at from 2 annas to 4 annas each, the price of the ordinary pot or *khiew ranei* varying from 2 pice to 4 annas each. A water-pot (*khiew um*) is also fashioned, which is sometimes used in the manufacture of liquor, price 4 annas to 6 annas each.

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmüller 1924a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

243 on from October to December. For millets the seed is sown in April-May and reaped about six months later. Maize is usually sown in
244 April-May and ripens in August - September. For potato, generally three crops are raised in the district ; the first is sown in December-January and harvested in April-May, the second is sown in February-March and is gathered in June-July and the third is sown in July-August and is harvested in November-December.

245 For oranges and betelnut the orchards are cleared of weeds twice a year. Harvesting of orange takes place from October to January. Betelnut ripens at the beginning of the year and are collected between February and May.

241 2.6.3 **Agricultural implements.**—The usual agricultural implements are a hoe, a sickle, three or four kinds of doas, a harrow, a crowbar which is used for the construction of irrigation channels, 'sierras' and winnowing baskets. Bullock drawn plough is used in wet paddy cultivation in parts of Jowai subdivision and in Bhoi area and resembles the one in use in the plains of the State.

2. 6. 4. **General cultural practices.**—The cultivators mostly adhere to their indigenous practices of cultivation. Rotation of crops is not widely used. Cultivation of rice is usually done by broadcasting the seeds though transplanting is also in vogue in some areas. Mixed cropping is widely practised. Cultivation by making terraces in the hill slopes is gaining popularity in the district.

433 2.7 **Cottage Industries.**—Cottage Industries, it appears, have not
326 found very great favour among the people of the district. A few
323 families here and there manufacture iron implements, earthenware,
285 pottery, baskets, mats and jewellery. In striking contrast with other
306 districts weaving of cotton clothes is rare among the Khasis. The
286 Mikirs in Bhoi area and in areas adjoining North Cachar and Mikir
171 Hills practice it only for their domestic consumption. At present, the
654 Government is trying to popularise weaving in the district and this
231 has been welcomed by the Khasis. Among other cottage industries production of eri cocoon in the northern part of the district adjoining Kamrup district and bee keeping throughout the district are worth mentioning.

142 2.8 **The People.**—The Khasis and Jaintias are a short sturdy
147 race distinct from the neighbouring hill tribes. By nature they are
441 hardy and laborious and in respect of manual labour, they are free
563 from any inhibition. Side by side with the Khasis live the Mikirs, Garos and Nepalis who form respectively 7.32 percent, 3.38 percent and 3·27 per cent of the total rural population. Besides, there are plains people who are mainly concentrated in the town of Shillong. In the marketing centres of the border area there are a large number of Bengali Hindus who dominate the bulk of the trade in the border areas.

241 2.9 **Occupation.**—The greater portion of the population of the
433 district subsists on cultivation. More than 75 percent of the rural
461 households are predominantly agricultural. The industrious Khasi agriculturists males and females have a high regard for hard labour

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

211 the Mikirs, the monoliths at Willong in the Manipur Hills, and
214 the Dimapur monoliths.

(3) The meaning of the stones.

(4) The method of their erection.

With regard to the first heading, the stones may be divided into (*a*) menhirs, or vertical stones; (*b*) table-stones, or dolmens, and (*c*) stone cromlechs, or cairns, which serve the purpose of *cineraria*. Taking the different stones in order, the menhirs are large upright stones varying in height from 2 or 3 ft. to 12 or 14 ft., but in exceptional instances rising to a more considerable elevation, the great monolith at Nartiang, in the Jaintia Hills, being 27 ft. high, and 2½ ft. thick. A photograph of this stone has been included. These menhirs are erected all in one line which nearly always consists of an uneven number of stones. Three is the commonest number of menhirs, but five together are frequently to be found, and there are some instances of seven stones; at Laitkor nine stones are standing, an illustration of which [324] will be found in this book. The stones are of hewn gneiss granite, or sandstone, to be met with in many places in these hills. They are rough hewn, and generally taper gradually to their tops, which are sometimes neatly rounded off. The tallest stone is usually in the middle, and is occasionally ornamented with a small stone, through the middle of which a hole has been drilled so that it may fit on the top of the other. At Nongkrem there is a centre stone with a regularly carved top, evidently intended to represent the head of a man. At Umstow, some two miles from Cherrapunji by the cart road, stood two rows of fine monoliths, each row five in number, and standing on either side of the old bridle road. All of these stones except one were thrown down by the earthquake shock of June, 1897. The centre stone, or *mawkni*, of one of these rows was surmounted by a carved stone covering shaped like a hat, but having a rim with indented edges, the intention being evidently to represent a crown. This stone crown was riveted to the top of the large centre stone. All the stones, including the *mawkynthei*, or dolmen, have been very neatly hewn. They appear to be of granite. Stones with top coverings or carved heads are however rare.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

In former years the Khásiás were great iron-smelters, and enormous excavations in the most favourable localities for obtaining ironstone prove the extent to which this manufacture was carried on. In some places the whole surface of the ground appears to have been dug up for a depth of several feet, leaving huge boulders standing up here and there. Of late years, however, as the price of labour in the Hills has risen, the trade in iron has died away, and there is now little demand for the Khásí article, the cheaper English metal having driven it out of the market. 178 316 325

NATURAL PHENOMENA.—Many peculiar caves and caverns are found in the limestone rock formation, the most notable being the caves at Cherrá Púnji and at Rúpnáth in Amwi. At the latter place the caverns extend a great distance beneath the earth, one being imagined by the people to reach as far as China, and a Hindu legend states that a Chinese army once marched by this route to the invasion of India. In another cave, the limestone stalactites have been carved into images representing the gods of the Hindu pantheon. On the banks of the Kapilí river on the Cáchár border, at a place called Sumir, there is a hot spring, the water of which contains carbonate of lime. All the rivers in the Hills flow through gorges in certain parts of their course, the most picturesque being at Tehriá, where a small stream is compressed into deep pools among limestone rocks; and at Darrang and Borghát, where the Mangat and Mantideo rivers respectively debouch upon the plains. 133 [823]

FORESTS, ETC.—The India-rubber or caoutchouc tree is found in many forests throughout the Hills, but not in great numbers, and the supply and value of the gum has much decreased of late years. In 1870 the right of tapping the trees in the Jáintiá Hills was leased out for a sum of £36, 12s. 0d.; but by 1876 the trade had almost entirely ceased. There are some tracts of timber forest on the lower hills towards the Brahmaputra valley, but through the want of water carriage they are of no great value. Vigorous efforts are being made to preserve the forests in the higher plateaux. Owing to the habit of firing the jungle in spring prior to sowing, great waste of valuable timber has taken place; but since the country has been separated from Bengal and placed under the administration of the Chief Commissioner of Assam, attention has been given to the matter, and special areas are now being set apart for the preservation and growth of forest timber. Cinnamon grows wild in some parts of the country. There is a considerable trade carried on in 137 [314] 137 648 659 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

at Rs. 480,000, or £48,000, and the revenue derived by Government from the quarries was Rs. 67,266, or £6726. In addition, the Khásí Chiefs receive a revenue from this source of more than £2000. 648 651 317

IRON.—The smelting of iron was once the chief industry in the Khásí Hills, and a considerable quantity of the metal used to be exported into Sylhet, both in the crude and the manufactured state. Recently, however, this industry has almost died out, in the face of the competition of the superior article imported from England and sold in the plains at a cheaper rate. The indigenous methods of extracting, washing, and smelting the ore have been minutely described by Professor Oldham. The following description is taken from Mr. Allen's Report, dated 1858, at which date the annual export of smelted iron was estimated at 45,000 *maunds*, valued at Rs. 67,500, or £6750, at the rate of Rs. 1. 8 per *maund*: —'The ore is said to be most abundant and of the best quality in the State of Khyrim, especially at the villages of Nongkrím and Noyandri. A few iron articles, such as *dáos* or hill knives, *koddlis* or mattocks, spear and arrow-heads, are manufactured by the Khásí smiths in the Hills; but the greater bulk of the smelted iron is sent to the plains for sale in circular lumps weighing about 4 or 5 *sers*. These lumps, called *birá*, sell at Chhaták for from Rs. 1. 4 to Rs. 1. 6 per *maund*. The best iron, however, which is beaten into bars called *peti*, sells for from Rs. 1. 10 to Rs. 1. 12 per *maund*. Khásí iron is preferred to English, in consequence of its greater malleability. It is much used by the native boat-builders of Sylhet and the neighbouring Districts to make fastenings for the timbers of their boats. When brought into the market, it is more than half dross, and it is this circumstance which renders the iron trade unprofitable. The cost of carriage from the Hills to the plains is about 6 *ánnás* per *maund*; and the traders, who are all Khásiás themselves, affirm that they get an average profit of only 2 *ánnás* per *maund*.' The tables of trade for 1876-77 return no smelted iron as exported from the Hills, but Rs. 7000 of iron implements exported, against nails and ironmongery imported to the value of Rs. 18,000. 178 325 439 [326] [435] [501]

THE MANUFACTURES of the District, besides iron, consist of coarse cotton and *rundia* cloth, plain silver work, rude implements of husbandry, netted bags made of the fibre of the pine-apple, common pottery, and mats and baskets. With the exception of the 28 433

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

JEWELLERY.

301 The Khasis, as a people, may be said to be fond of jewellery. 326 The women are specially partial to gold and coral bead necklaces. The beads are round and large, and are usually unornamented with filigree or other work. The coral is imported from [439] Calcutta. The gold bead is not solid, but a hollow sphere filled with lac. These necklaces are worn by men as well as women, especially on gala occasions. Some of the necklaces are comparatively valuable, e.g. that in the possession of the Mylliem Siem family. The gold and coral beads are prepared locally by Khasi as well as by foreign goldsmiths. The latter derive considerable profits from the trade. The Assam Census Report of 1901 shows 133 goldsmiths in the Khasi and Jaintia Hills district, but does not distinguish between Khasis and foreigners. There are Khasi goldsmiths to be found in Mawkhar, Cherrapunji, Mawlai, and other villages. Sylheti goldsmiths are, however, more largely employed than Khasi in Mawsynram and certain other places on the south side of the hills. In Mr. Henniker's monograph on "gold and silver wares of Assam" it is stated that the goldsmiths of Karimganj in Sylhet make specially for Khasis certain articles of jewellery, such as men's and women's earrings, &c. An article of jewellery which is believed to be peculiar to the Khasis is the silver or gold crown. This crown is worn by the young women at 301 dances, such as the annual Nongkrem dance. An illustration of one will be seen by referring to the plate. These crowns are circlets of silver or gold ornamented with filigree work. There is a peak or, strictly speaking, a spike at the back, called *u'tiew-lasubon*, which stands up some six inches above the crown. There are long ropes or tassels of silver hanging from the crown down the back. Earrings are worn both by men and women. The former affect a pattern peculiar to themselves, viz. large gold pendants of a circular or oval shape. Women wear different patterns of earrings, according to locality. An ornament which I believe is also peculiar to the Khasis is the *rupa-tylli*, or silver collar. This is a broad flat silver collar which is allowed to hang down over the neck in front, and which is secured by a fastening behind.

Silver chains are worn by men as well as by women. The 301
men wear them round the waist like a belt, and the women hang them round their necks, the chains being allowed to depend as low as the waist. Bracelets are worn by women; these are either of gold or of silver. The Lynngam [321]
males wear bead necklaces, the beads being sometimes of cornelian gathered from the beds of the local hill streams, and sometimes of glass obtained from the plains markets of Damra and Moiskhola. The cornelian necklaces are much prized by the Lynngams, and are called by them *'pieng blei*, or gods' necklaces. Like the Garos, the Lynngams wear as many brass earrings as possible, the lobes of the ears of the females being frequently greatly distended by their weight. These earrings are made out of brass wire obtained from the plains markets. The Lynngams wear silver armlets above the elbow and also on the wrists. It is only a [554]
man who has given a great feast who can wear silver armlets above the elbows. These armlets are taken off as a sign of [765]
mourning, but never on ordinary occasions. The Lynngams do not wear Khasi jewellery, but jewellery of a pattern to be seen in the Garo Hills. A distinctive feature of the Lynngam women is the very large number of blue bead necklaces they wear. They put on such a large number as to give them almost the appearance of wearing horse collars. These beads are obtained from the plains markets, and are of glass. Further detailed information regarding this subject can be obtained from Mr. Henniker's monograph, which contains a good plate illustrating the different articles of jewellery.

WEAPONS.

The weapons of the Khasis are swords, spears, bows and arrows, 411
and a circular shield which was used formerly for purposes of 314
defence. The swords are usually of wrought iron, occasionally of [326]
steel, and are forged in the local smithies. The Khasi sword is of considerable length, and possesses the peculiarity of not having a handle of different material from that which is used for the blade. In the Khasi sword the handle is never made of wood or bone, or

• 326 The arrow tips are made of iron in the village smithies. The tips of the hunting arrows ('nam-pliang) are flat, raised a little towards the middle and have smooth or toothed edges and two or more barbs (shaped like a spear). Length of the tip is about 9 to 15 [531] centimeters. Beautiful wrought iron arrow tips with pierced designs are also made. (13)

13. Illustration II, figs. 3a, 3b.

[526] The tips of the arrows used for sport ('nam-sop) are round and conical. Length is about 3 to 6 centimeters.

The spear-shaped arrow tips are poisoned with (ka bih) poison which the Khasi obtain from the tuber or a plant (aconitum ferox Wallich, aconite).

Attaching the Arrow Tips.

411 The arrow tips are attached in two ways:

1. either the shaft of the arrow is pointed in front and the arrow tip, which is hollow inside, is placed on it-both are joined with sealing wax;

2. or there is a separate shell of copper which connects the arrow tip with the shaft. Sealing wax is not used, since the shell acts as a clamp. Length of the shell is about 1.5 centimeters.

The Notch of the Arrow

At the tip of the opposite end a notch is cut in every arrow. The arrow is taken from a whole 'nam-long or igrâ (kind of bamboo) in

Rearing of cocoons, etc. ...	1	1
Rearing of lac	1	1
Others	2	1

Blacksmithy and making of baskets, cane products, etc., out of cane and bamboo, are a traditional occupation. Weaving and spinning of cotton, rearing of eudi cocoon and weaving of eudi, etc., are in vogue only in the Bhoi area and the areas adjoining Kamrup and North Cachar and Mikir Hills districts. Lac rearing is found in the northern portion of the district, *i.e.*, Nongpoh area.

Except cane and bamboo works and blacksmithy other industries are practised in a very limited scale. There is thus a lot of scope for introducing cottage industries in the district.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

at Rs. 480,000, or £48,000, and the revenue derived by Government from the quarries was Rs. 63,166, or £6,316. In addition, the Khási Chiefs receive a revenue from this source of more than £1000. 698 651 317

IRON.—The smelting of iron was once the chief industry in the Khási Hills, and a considerable quantity of the metal used to be exported into Sylhet, both in the crude and the manufactured state. Recently, however, this industry has almost died out, in the face of the competition of the superior article imported from England and sold in the plains at a cheaper rate. The indigenous methods of extracting, washing, and smelting the ore have been minutely described by Professor Oldham. The following description is taken from Mr. Allen's Report, dated 1858, at which date the annual export of smelted iron was estimated at 45,000 *maunds*, valued at Rs. 67,500, or £6750, at the rate of Rs. 1. 8 per *maund*:—'The ore is said to be most abundant and of the best quality in the State of Khyrim, especially at the villages of Nongkrim and Noyambri. A few iron articles, such as *dáos* or bill knives, *hoddis* or mattocks, spear and arrow-heads, are manufactured by the Khási smiths in the Hills; but the greater bulk of the smelted iron is sent to the plains for sale in circular lumps weighing about 4 or 5 *seers*. These lumps, called *bind*, sell at Chhatak for from Rs. 1. 4 to Rs. 1. 8 per *maund*. The best iron, however, which is beaten into bars called *pati*, sells for from Rs. 1. 10 to Rs. 1. 12 per *maund*. Khási iron is preferred to English, in consequence of its greater malleability. It is much used by the native boat-builders of Sylhet and the neighbouring Districts to make fastenings for the timbers of their boats. When brought into the market, it is more than half dross, and it is this circumstance which renders the iron trade unprofitable. The cost of carriage from the Hills to the plains is about 6 *annas* per *maund*; and the traders, who are all Khásis themselves, affirm that they get an average profit of only 1 *anna* per *maund*.' The tables of trade for 1876-77 return no smelted iron as exported from the Hills, but Rs. 3000 of iron implements exported, against nails and ironmongery imported to the value of Rs. 18,000. 178 325 439 [326] [435] [501]

THE MANUFACTURES of the District, besides iron, consist of coarse cotton and *rendia* cloth, plain silver work, rude implements of husbandry, netted bags made of the fibre of the pine-apple, common pottery, and mats and baskets. With the exception of the 28 433

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

with the exception of the

326 manufacture of iron, in which the master blacksmith often employs
462 hired labourers, the other industries are generally followed by
463 females in their own houses. No class of labourers are hereditarily
attached to any manufacture in a manner that affects their personal
freedom. The system of advancing money for manufacturing pur-
452 poses does not obtain in the Khási and Jáintiá Hills. The total
434 value of the manufactures of the District is stated to be between
£1000 and £3000 per annum. No local manufactures are carried
on by means of imported capital.

439 COMMERCE AND TRADE.—The external commerce of the Khási and Jáintiá Hills is chiefly conducted on the southern boundary, through the District of Sylhet. The total value is more considerable than might be expected, owing to the fact that these Hills practically possess the monopoly of supplying Bengal with lime, potatoes, and oranges. Other important articles of export are raw cotton, stick-lac, betel-nut and *pán* leaves, and bay leaves or *tejpát*. The exportation of iron, which was once large, has now almost ceased. The chief imports consist of rice, dried fish, cotton cloth, salt, and tobacco. On the whole, it would appear that the course of trade is about equally balanced. Trade statistics of more or less value are in existence. The earliest of such statistics are to be found in the Report of Mr. W. J. Allen, dated 1858. The information there given was based for the most part upon oral statements furnished by numerous native traders to Mr. Hudson, who then filled the office of Principal Assistant-Commissioner. It may be accepted as 'a fair representation of the state of trade in
439 the Hills' at that time. The imports and exports on the Assam
434 side were each estimated at about Rs. 15,000, or £1500. The trade with the markets in the Surmá valley was much larger. The total of the exports was valued at Rs. 700,000, or £70,000, giving a profit to the traders of Rs. 170,705, or £17,070. The chief items were:—Limestone, 1,700,000 *maunds*, valued at Rs. 306,000; potatoes, 50,000 *maunds*, value Rs. 125,000; oranges, 45,000,000 in number, value Rs. 78,750; smelted iron, 45,000 *maunds*, value Rs. 67,500; cotton, 12,000 *maunds*, value Rs. 42,000; betel-nuts, value Rs. 37,500; coal, 25,000 *maunds*, value Rs. 12,500. The total value of the imports was estimated at Rs. 350,000, or £35,000, being just one-half the value of the exports; the estimated profits are given as Rs. 44,325, or £4432. The chief items were:—Rice, 150,000 *maunds*, value Rs. 225,000; cloth of sorts, Rs. 25,000;

Total	[illegible]*

The following information regarding the general aspect of the Khasi and Jaintia Hills district, with some additions, is derived from Sir William Hunter's Statistical Account of Assam. The district consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is very steep until a table-land is met with at an elevation of about 4,000 feet at Cherrapunji. Higher up there is another plateau at Mawphlang. This is the highest portion of the hills, some villages being found at as high an elevation as close on 6,000 feet above sea level. Fifteen miles to the east of Mawphlang, and in the same range, is situated the civil station of Shillong, at an average elevation of about 4,900 feet. The elevation of the Shillong Peak, the highest hill in the district, is 6,450 feet above sea level. On the northern side of the hills are two plateaux, one between 1,000 and 2,000 feet below the level of Shillong, and another at an elevation of about 2,000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where the hills have been denuded of forest, the country is covered with short grass, which becomes longer and more rank in the lower elevations. This denudation of forest has been largely due to the wood being used by the Khasis for fuel for iron smelting in days gone by. The Government, however, has taken steps to protect the remaining forests from further spoliation. A remarkable feature is the presence of numerous sacred groves situated generally just below the brows of the hills. In these woods are to be found principally oak and rhododendron trees. The fir-tree (Pinus Khasia) is first met with on the road from Gauhati to Shillong, at Umsing, at an elevation of about 1,500 feet. In the neighbourhood of Shillong the fir grows profusely, but the finest fir-trees are to be seen

* The figures for Khasi population in the Khasi and Jaintia Hills district will be found under "Subdivisions."

I: Garden E-4, 5 (no date) 1907 AR7 Khasi AR7

the ground and well oiled. A silver ornament, or a few rupees, placed at the top, reward the successful climber." A leg of mutton, or a piece of pork fixed at the top of this pole would render the pastime identical with the "greasy-pole" climbing of English villages. The following are some other Khasi games:—

Wrestling; two persons grasping each other's hands with the fingers interlocked, and then trying to push one another down; tug-of-war with a piece of stick, the two combatants placing their feet one against the other; butting at one another like bulls, and trying to upset each other (*in fact mere*); long jump; high jump; blind-man's buff; flying kites; pitching cowries into a hole in the ground; a game like marbles, only played with round pebbles, and others.

MANUFACTURES.

The manufactures of the Khasis are few in number, and do not seem to show any tendency to increase. On the contrary, two of the most important industries, the smelting of iron ore and the forging of iron implements therefrom, and the cotton-spinning industries at Mynso and Sohkings, show signs of dying out. Ploughshares and hoes and bill-hooks can now be obtained more cheaply from the plains than from the forges in the hills, and Manchester piece goods are largely taking the place of cloths of local manufacture. The iron industry in former days was an important one, and there is abundant evidence that the workings were on a considerable scale, e.g. at Nongkrem and Laitlyngkot, in the shape of large granite boulders which have fallen to the ground from the sides of the hills owing to the softer rock which filled the interstices between the boulders having been worked out by the iron-workers, their process being to dig out the softer ferruginous rock, and then extract the iron ore from it by means of washing. The softer rock having been removed, the heavier portions fell by their own weight, and rolled down to the bottom of the slopes, the result being the great number of boulders to be seen near the sites of these workings.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

327 Colonel Lister, writing in 1853, estimated that 20,000 maunds
439 of iron were exported from the hills in the shape of hoes to
442 the Assam Valley, and in lumps of pig iron to the Surma Valley, where it was used by boat-builders for clamps. Nowadays the smelting of iron is carried on in very few places. There are still smelting-houses at Nongkrem and Nongpyrung, but these are practically the only places left where smelting of iron ore goes on; there are many forges where rough iron brought from the plains is melted down and forged into bill-hooks and hoes. Messrs. Yule and Craccroft have described the native process of smelting iron, and it is only necessary to refer to their papers if information is required on the subject. Yule's account is a very full one, and is to be found at page 853, vol. vi part ii. of the *Journal of the Asiatic Society of Bengal*. The system pursued, both in the extraction and in the subsequent smelting of the ore, is the same at the present day as that described by Yule. Dr. Oldham, writing in 1863, says, "The quality of this Khasi iron is excellent for all such purposes as Swedish iron is now used for. The impurity of the blooms (or masses of the metal in a molten state), however, as they are sent to market, is a great objection to its use, and the waste consequent thereon renders it expensive. It would also form steel or wootz (Indian steel) of excellent quality. I have no doubt that the manufacture could be greatly improved and possibly extended." Dr. Oldham, however, goes on to remark that the manufacture of iron could not be very much extended, owing to the scanty dissemination of the ore in the rocks, and the consequent high cost of obtaining it. At present the want of any permanent supply of water prevents the natives from working for more than a few days during the year, whilst the rains are heavy, and they can readily obtain sufficient force of water for the washing of the ore from its matrix. The export of iron in any form from the district has now almost died out, only a few bars being brought down by the Khasis from Lubbam, in Khubowphed, to the Burdwar and Fakshari markets in the Kamrup District of the Assam Valley. Iron of English manufacture has, of course, much cheapened the market, but probably the fact that the parts of the country in the neighbourhood of the rocks which contain the metal have

113
114
327

327

[344]

been denuded completely of timber, charcoal being necessary for smelting, has affected the production almost as much as the presence of cheap iron in the market.

MANUFACTURE OF ERI SILK CLOTHS AND COTTON CLOTHS IN THE JAINTIA HILLS.

The number of weavers in the district at the last Census was 533. This number in the Census Report is ascribed to the cotton industry, no mention being made of weavers of silk. The spinning of Eri silk thread, and weaving it into cloths is, however, a fairly considerable industry amongst the Khyrwang and Nongtung villages of the Jaintia Hills. The Nongtungs and Khyrwangs rear their own Eri worms, and spin the silk from the cocoons. The late Mr. Stack, in his admirable note on silk in Assam, says, "Throughout the whole range of the southern hills, from the Mikir country, Eri thread is in great request for weaving those striped cloths, in which the mountaineers delight," but this observation should have been confined to the Jaintia Hills portion of this district, the Khasis not weaving themselves either in silk or cotton. The Khasis obtain their silk cloths from the Assam Valley, and from the Nongtung or Khyrwang villages in Jaintia. The latter villages have given the name to the striped cloth, *ka jiin Khyrwang*, which is almost invariably worn by the Syntengs. Mr. Stack has given in detail a description of the silk industry in Assam; and it is not therefore necessary to go over the same ground here. The Khyrwang cloth is red and white, mauve and white, or chocolate and white, the cloth being worn by both men and women. The Khyrwang cloths vary in price from Rs. 5 to Rs. 25, according to size and texture. These cloths are the handiwork of women alone, and a woman working every day regularly will take six months to manufacture a cloth valued at Rs. 25; but, as a rule, in the leisurely manner in which they work, it takes a year to complete it.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

000 which are not found usually in the people of India. He is
461 not above manual labour, and even the Khasi clerk in the
333 Government offices is quite ready to take his turn at the hoe
335 in his potato garden. The men make excellent stonemasons and carpenters, and are ready to learn fancy carpentry and
276 mechanical work. They are inveterate chewers of *supari* and
809 the pan leaf (when they can get the latter), both men, women, and children; distances in the interior being often measured by the number of betel-nuts that are usually chewed on a
273 journey. They are not addicted usually to the use of opium or other intoxicating drugs. They are, however, hard drinkers, and consume large quantities of spirit distilled from rice or millet. Rice beer is also manufactured; this is used not only as a beverage, but also for ceremonial purposes. Spirit drinking is confined more to the inhabitants of the high plateaux and to the people of the Wár country, the Bhois and Lyngams
276 being content to partake of rice beer. The Mikirs who inhabit
751 what is known as the "Bhoi" country, lying to the north of the district, consume a good deal of opium, but it must be remembered that they reside in a malarious *terai* country, and that the use of opium, or some other prophylactic, is probably
525 beneficial as a preventive of fever. The Khasis, like other people of Indo-Chinese origin, are much addicted to gambling.
577 The people, and especially those who inhabit the Wár country, are fond of litigation. Col. Bivar remarks, "As regards truthfulness the people do not excel, for they rarely speak the truth unless to suit their own interests." Col. Bivar might have confined this observation to the people who live in the larger centres of population, or who have been much in contact with the denizens of the plains. The inhabitants of the far interior are, as a rule, simple and straightforward people, and are quite as truthful and honest as peasants one meets in other countries. My impression is that the Khasis are not less truthful certainly than other Indian communities. McCosh, writing in 1837, speaks well of the Khasis. The following is his opinion of them:—"They are a powerful, athletic
[42] race of men, rather below the middle size, with a manliness of gait and demeanour. They are fond of their mountains, and look down with contempt upon the degenerate race of the

[the Khasis --- Angul 7.1]

342 but for themselves. In all these cases the youngest daughter of the family who is known as the Ka Khadduh of the family must live in the old house and maintain the social and religious traditions of the family. In the village of Mawphlang we found that the houses of all the Ka Khaddubs like Ka Sadia, Ka Hosibon and others, and also the old house of the wife of U. Suburai, the myntri of the Mawphlang State, all belong to this 'U'-shaped type. This association of Ka Khaddubs and 'U' shaped huts suggests that this is the old type. The modern huts vary in their structure, some being like modern bungalows common now-a-days in Shillong.

The old Khasi house, in general, can be described as follows :—

[343] [35] Generally there is a compound in front and a pigsty at one side, the whole site being enclosed by a fencing of reed and small plants or of wooden planks or some such material. The hut as observed from outside is elliptical in front and box-shaped behind (as seen in the diagram). It is 'U'-shaped in the ground plan. The roof of the hut is sloped on the two sides and spread out like a fan, in a semi-circle, in front.

• 333 342 The material used in the construction of the hut varies. In some of the old houses the walls were found to be made of blocks of stone with mud in the interstices serving the purpose of mortar. The roof had a bamboo frame covered with thatching grass. In other old huts the walls were not entirely made of stone blocks. In some we found the front portion made entirely of stone, the lower portions of the side and of the rear walls, up to a level of two to three feet, made of stone, the remaining portions being made of wooden planks or reeds covered with mud. In some modified huts again (either they were built later or the old huts were repaired) the entire rear wall except at the base and the upper portions of the sides were made of tinplates from used cans nailed to a frame. In some huts corrugated and galvanised iron sheets have been used. The material for the roof

also varies a good deal now-a-days, some being of corrugated galvanised iron sheets and others of flat tinplate sheets instead of

Ground plan

3. Ka Kynrein; 4. Ka Ring Kyndong;
5. Ka Rumpei; 6. Ka Dypei.

thatching grass. In some modified houses we found a porch added in front of the main door of the hut.

Entering the hut by the main door, the interior can be divided into two compartments, the front one which is on the ground level and the inner compartment which has a wooden floor raised to a height of about four feet supported on pillars of stone.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

000 which are not found usually in the people of India. He is
461 not above manual labour, and even the Khasi clerk in the

525 beneficial as a preventive of fever. The Khasis, like other people of Indo-Chinese origin, are much addicted to gambling.
577 The people, and especially those who inhabit the Wár country, are fond of litigation. Col. Bivar remarks, "As regards truthfulness the people do not excel, for they rarely speak the truth unless to suit their own interests." Col. Bivar might have confined this observation to the people who live in the larger centres of population, or who have been much in contact with the denizens of the plains. The inhabitants of the far interior are, as a rule, simple and straightforward people, and are quite as truthful and honest as peasants one meets in other countries. My impression is that the Khasis are not less truthful certainly than other Indian communities. McCosh, writing in 1837, speaks well of the Khasis. The following is his opinion of them:—"They are a powerful, athletic
[47] race of men, rather below the middle size, with a manliness of gait and demeanour. They are fond of their mountains, and look down with contempt upon the degenerate race of the

[the Khasis — Angly.]

headquarters of the Administration. The manufacture of country spirit gives employment to a considerable number of persons, most of whom are females. At a recent census of the country stills in the district, undertaken by the district officials, the number of stills has been found to be 1,530. There must be at least one person employed at each still, so that the number of distillers is probably not less than 2,000, possibly more. The spirit is distilled both for home consumption and for purposes of sale, in some villages almost entirely for sale. In the Jaintia Hills stock-breeding and dealing in cattle provides occupation for 1,295 people, according to the last census. The cattle are reared in the Jaintia Hills and are driven down to the plains when they reach the age of maturity, where they find a ready market amongst the Sylhetis. Cattle are also driven into Shillong for sale from the Jaintia Hills. Another place for rearing cattle is the Siemship of Nongkhlaw, where there is good pasturage in the neighbourhood of Mairang. These cattle are either sold in Shillong or find their way to the Kamrup district by the old Nongkhlaw road. Cattle-breeding is an industry which is capable of expansion in these hills. There are a few carpenters to be found in Shillong and its neighbourhood. The Khasis are said by Col. Waddell to be unacquainted with the art of weaving; but the fact that a considerable weaving industry exists amongst the Khyrwang villages of the Syntengs, and at Mynso and Suhtngs, has been overlooked by him. The Khyrwangs weave a special pattern of cotton and silk cloth, striped red and white. In Mynso and Suhtngs similar cloths are woven, also the sleeveless coat. In former days this industry is said to have been considerable, but it has been displaced to a large extent of late years by Manchester piece goods. The number of weavers returned at the last census in the district was 533. The Khasis and Mikirs of the low country, or Bhois as they are called, weave cotton cloths which they dye with the leaves of a plant called u nelli. This is perhaps the wild indigo, or *rum*, of the Shan settlers in the Assam Valley. The weavers are almost always females. An important means of subsistence is road and building work; a considerable number of coolies, both male and female, are employed under Government, practically throughout the year, in

16: McCormack E-4,5 (1956-1958) 1964
[P. 108 B] AR7 Khasi AR7

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongrung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, cardamom, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shawls, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stoughton 1954a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

577 plains, jealous of their power, brave in action, and have an aversion to falsehood."

797 Khasis of the interior who have adopted Christianity are generally cleaner in their persons than the non-Christians, 177 and their women dress better than the latter and have an air 515 of self-respect about them. The houses in a Christian village 342 are also far superior, especially where there are resident European missionaries. Khasis who have become Christians often 771 take to religion with much earnestness (witness the recent 797 religious revival in these hills, which is estimated by the Welsh 794 missionaries to have added between 4,000 and 5,000 converts to Christianity), and are model Sabbatarians, it being a pleasing sight to see men, women, and children trooping to church on a Sunday dressed in their best, and with quite the Sunday expression on their faces one sees in England. It is a pleasure to hear the sound of the distant church bell on the hill-side on a Sunday evening, soon to be succeeded by the beautiful Welsh hymn tunes which, when wafted across the valleys, carry one's thoughts far away. The Welsh missionaries have done, and continue to do, an immense amount of good amongst these people. It would be an evil day for the Khasis if anything should occur to arrest the progress of the mission work in the Khasi Hills.

GEOGRAPHICAL DISTRIBUTION.

162 The Khasis inhabit the Khasi and Jaintia Hills, although 101 there are a few Khasi settlers in the neighbouring plains districts. The Census Report of 1901 gives the following figures of Khasi residents in the plains:—

Cachar	333
Sylhet	3,083
Goalpara	4
Kamrup	191
Darrang	10
Nowgong	29
Sibsagar	62

231 Shillong is excellent, the flavour being quite as good as that
263 of English honey. Under "Miscellaneous Customs connected with Death" will be found a reference to the statement that the
[764] dead bodies of Siems used to be embalmed in honey. The existence of the custom is generally denied by Khasis, but its former prevalence is probable, as several trustworthy authors have quoted it.

HOUSES.

342 The houses of the people are cleaner than might be supposed
515 after taking into consideration the dirtiness of the clothes and persons of those who inhabit them. They are as a rule substantial thatched cottages with plank or stone walls, and raised on a plinth some 2 to 3 ft. from the ground. The only
354 window is a small opening on one side of the house, which admits but a dim light into the smoke-begrimed interior. The beams are so low that it is impossible for a person of ordinary stature to stand erect within. The fire is always burning on an earthen or stone hearth in the centre. There is no chimney, the smoke finding its exit as best it can. The firewood is placed to dry on a swinging frame above the hearth. In the
343 porch are stacked fuel and odds and ends. The pigs and calves
342 are generally kept in little houses just outside the main building. The Khasi house is oval-shaped, and is divided into three rooms, a porch, a centre room, and a retiring-room.

354 In olden days the Khasis considered nails *sang*, or taboo, and
784 only used a certain kind of timber for the fender which surrounds the hearth; but they are not so particular now-a-days. In Mawkhar, Cherrapunji, and other large villages, the walls of
342 houses are generally of stone. In Cherrapunji the houses are frequently large, but the largest house I have seen in the hills is that of the Doloi of Subtngs in the Jaintia Hills, which measures 74 ft. in length. The house of the Siem Priestess at Smit in the Khasi Hills is another large one, being 61 ft. long by 20 ft. broad. In front of the Khasi house is a little space fenced in on two sides, but open towards the village street. The

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

342 Syntengs plaster the space in front of the house with red earth and cow-dung, this custom being probably a remnant of Hindu influences. The Khasis have some peculiar customs when they build a new house. When the house is completed they perform a ceremony, *kynjoh-hku-skain*, when they tie three pieces of dried fish to the ridge pole of the house and then jump up and try to pull them down again. Or they kill a pig, cut a piece of the flesh with the skin attached, and fix it to the ridge pole, and then endeavour to dislodge it. The Syntengs at Nartiang worship *U Biskurom* (Biswakarma) and *Ka Siem Synshar* when a house is completed, two fowls being sacrificed, one to the former, the other to the latter. The feathers of the fowls are affixed to the centre post of the house, which must be of *u dieng sniang*, a variety of the Khasi oak. The worship of a Hindu god (Biswakarma), the 776 architect of the Hindu gods, alongside the Khasi deity *Ka Siem* 177 *Synshar*, is interesting, and may be explained by the fact that 342 Nartiang was at one time the summer capital of the kings of Jaintia, who were Hindus latterly and disseminated Hindu customs largely amongst the Syntengs. Mr. Rita says that 627 amongst the Syntengs, a house, the walls of which have been 342 plastered with mud, is a sign that the householder has an enemy. The plastering no doubt is executed as a preventive of fire, arson in these hills being a common form of revenge.

342 Amongst the Khasis, when a daughter leaves her mother's house and builds a house in the mother's compound, it is considered *sang*, or taboo, for the daughter's house to be built on the right-hand side of the mother's house, it should be built either on the left hand or at the back of the mother's house.

776 In Nongstoin it is customary to worship a deity called 793 *u-ki lop* (Khasi, *u phaw*), by nailing up branches of the Khasi oak, interspersed with jaw-bones of cattle and the feathers of fowls, to the principal post, which must be of *u dieng sniang*. The Siem priestess of the Nongkrem State at Smit and the ladies of the Siem family perform a ceremonial dance before a large post of oak in the midst of the Siem priestesses' house on the occasion of the annual goat-killing ceremony. This oak post is furnished according to custom by the *lyngskor*

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

776 793 or official spokesman of the Siem's Durbar. Another post of oak in this house is furnished by the people of the State.

342 177 353 The houses of the well-to-do Khasis of the present day in Mawkhar and Cherrapunji are built after the modern style with iron roofs, chimneys, glass windows and doors. In Jowai the well-to-do traders have excellent houses of the European pattern, which are as comfortable as many of the European subordinates' quarters in Shillong. Some up-to-date families in Shillong and at Cherra allow themselves muslin curtains and European furniture.

342 [324] The houses of the Pnar-Wárs are peculiar. The roof, which is thatched with the leaves of a palm called a *tyaniw*, is hog-backed and the eaves come down almost to the ground. There are three rooms in the Wár as in the Khasi house, although called by different names in the Wár dialect. The hearth is in the centre room. [361] The houses are built flush with the ground and are made of bamboo. In the Wár villages of Nongjri and 396 Umniah there are small houses erected in the compounds of 782 the ordinary dwelling-houses called *ing hynid* (spirit houses). In these houses offerings to the spirits of departed family ancestors are placed at intervals, this practice being very similar to the more ancient form of Shintoism. In some Wár villages 342 there are also separate bachelors' quarters. This custom is in accordance with that of the Naga tribes. There is no such custom amongst the Khasi Uplanders. The Wár houses are similar to those of the Pnar Wárs, except that a portion of the house is generally built on a platform, the main house resting on the hill-side and the portion on the platform projecting therefrom, the object being to obtain more space, the area for houses in the village sites being often limited owing to the steepness of the hill-sides.

The Bhoi and Lyngngam houses are practically similar, and may be described together. They are generally built on fairly high platforms of bamboo, are frequently 30 to 40 ft. in length, and are divided into various compartments in order [354] to suit the needs of the family. The hearth, which is of earth, is in the centre room. There is a platform at the back of the Lyngngam house, and in front of the Bhoi house, used for drying paddy, spreading chillies, &c., and for sitting on when the day's

work is done. In order to attend to a Bhoi house, you have to climb up a notched pole. The Bhois sacrifice a he-goat and a fowl to *Rik-kuplong* (Khasi, *Rumiew ñiej*), the household god, when they build a new house.

VILLAGES.

Unlike the Naga and Kukis, the Khasis do not build their villages on the extreme summits of hills, but a little below the top, generally in small depressions, in order to obtain some protection from the strong winds and storms which prevail in these hills at certain times of the year. According to the late U Jowlon Roy, it is *sang*, or taboo, to the Khasis to build a house on the last eminence of a range of hills, this custom having perhaps arisen owing to the necessity of locating villages with reference to their defence against an enemy. Khasis build their houses fairly close together, but not as close as houses in the Bhoi and Lyngngam villages. Khasis seldom change the sites of their villages, to which they are very much attached, where, as a rule, the family tombs are standing and the *mawbynna* or memorial stones. In many villages stone cromlechs and memorial stones are to be seen which from their appearance show that the villages have been there for many generations. During the Jaintia rebellion the village of Jowai was almost entirely destroyed, but as soon as the rebellion was over the people returned to the old site and rebuilt their village. Similarly, after the earthquake, the ancient village sites were not abandoned in many cases, but the people rebuilt their houses in their former positions, although in Shillong and Cherrapunji they rebuilt the walls of the houses of wooden materials instead of stone. There is no such thing as a specially reserved area in the village for the Siem and the nobility, all the people, rich or poor, living together in one village, their houses being scattered about indiscriminately. To the democratic Khasi the idea of the Siem living apart from his people would be repugnant. In the vicinity of the Khasi village, often just below the brow of the hill to the leeward side, are to be seen dark woods of oak

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

custom of their own from cultivating the *landoo*, in which case they plant certain other trees favourable to the growth of the lac insect. The villages are situated near their patches of cultivation in the forest. The villages are constantly shifting, owing to the necessity of burning fresh tracts of forest every two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the houses are raised some 3 or 4 ft. from the ground on platforms, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading chillies and other articles to dry. Some Lyngam houses have only one room in which men, women, and children are all huddled together, the hearth being in the centre, and, underneath the platform, the pigs. Well-to-do people, however, possess a retiring room, where husband and wife sleep. A house I measured at Nongshlar village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a Garo custom. In some Lyngam villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the village festivities go on. These are similar to the *dekachang* or bachelors' club-houses of the Mikirs, Garos, and Lalungs, and to the *morung* of the Nagas. This is a custom of the Thibeto-Burman tribes in Assam, and is not a Khasi institution. There are also high platforms, some 12 ft. or 15 ft. in height, in Lyngam villages, where the elders sit of an evening in the hot weather and take the air. Lyngam houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lyngams keep pigs, they do not seem to be so much *en évidence* as in the Khasi village. There is little or no furniture in a Lyngam house. The Lyngam sleeps on a mat on the floor, and in cold weather covers himself with a

784

for a cremation). See table I, picture 2, "The heathen Khasi village Raliang with a "holy wood" (law kyntang) in the background."

6. Giving or taking anything at all with the left hand.
7. Stepping over the corpse of another person.
8. Killing an animal or bird without having previously strewn rice on its head.
9. Using the milk of the cow or the goat.
10. Completing all kinds of started sewing or basket weaving for pregnant women.
11. Pregnant women are not allowed to accompany any funeral procession.
12. The husband of a pregnant woman is forbidden to roof the house (straw roof) or to make a handle for a hatchet or an axe (ka wait - ka da).
13. Speaking with anyone at all as long as the threshing of the rice lasts, unless it is with the co-workers of the man or of the woman.
14. Variously the use of pork, dried fish, melons, lemons, etc. is forbidden.

784 Violating the sang is punished by the
68 deity. Thus several Khasi explained after the
342 great earthquake of June 12, 1897: "Because you built your houses of stone and fastened the planks with nails, it has so happened that everything has tumbled down, because god does not wish stone and despises nails. Formerly we too built only with wood and bamboo and used bast for making things fast and for binding, but today people have become proud and have built with stone. That is why this has happened; god

hotee stone; he does not wish any lime." (14.)

4. Egg Throwing (khat-pylleng)

The most common of all the oracles of the Khasi is egg throwing (khat-pylleng). A great deal has already been written about it. (15)

15. P. Dr. C. Becker, Das Eierwerfen der Khasi (Egg Throwing Among the Khasi), Anthropos XII-XIII (1917-1918), pp. 434-436.

I will only add here the prayer of the sacrificer a nongkhat-pylleng. It is not an actual prayer, at least the nongkhat-pylleng is not bound to any formula. The sacrificer speaks approximately thus:

Ka longsem khun ka blei, ka bamang ka bstip ka ka lah ka bslai, nga pyrkhah nga pyrdem haiar ka dienghat ka dienghsein, ka duwan ka dupat, a kynrad ngan kylli ngan

O thou egg of the oracle, thou daughter of the goddess, thou whom thou knowest and art aware of (art able to) thou commanest thou (already). I cut thee down here on the board (16)

291 small kilt), and a cap which is peaked in front and which comes down well over the ears, called (*ka ingin ehor*) *ear cap*. The dress of the Khasi females is somewhat different from that of the Syntengs, the former wears a striped cloth tied round the waist, hanging down to the knees, and another cloth, with a fringed border, knotted on both the shoulders to cover the bust and a narrow cloth, called *ka jymphen*, to serve the purpose of under-clothing. A cloth knotted in front is also worn like a cloak over shoulders. The Syntengs women wears a cloth smoothed round the body fastened above the bust and dropping down to the ankles. Another cloth is thrown over the shoulders, and crossed in front. Both Khasi and Syntengs women wear a cloth tied over the head, called *ka tap mukhlieh*. Up-to-date Khasi males wear knickerbockers, stockings, and boots, and females chemises. On festive occasions, both Khasis and Syntengs, males and females, wear expensive silks, with earrings of gold or silver. There is a special dancing-dress of elaborate pattern. The women at festivals wear a circlet of silver with a spear-head ornament behind, rising 4 or 5 inches from the back of the head. Large coral beads are much valued, and necklaces of alternate beads of coral and gold, and sometimes of coral alone, are worn by the chief's and their principal followers. Such necklaces are worn by women also on gala occasions. The staple diet of both Khasis and Syntengs is rice and dried fish. They are, however, fond of all kinds of meat, especially pork. Some of the Syntengs abstain from beef, owing no doubt to Hindu influences. Neither Khasis nor Syntengs eat dog, which is partaken of with zest by the Naga and the Garo tribes,—this is owing to the dog being considered by the Khasis to be the friend of man. Neither Khasis nor Syntengs use milk, the latter being thought by them to be an excrement. Neither Khasis nor Syntengs tattoo. The weapons of both Khasis and Syntengs are bows and arrows, swords and shields. The national game of the Khasis is archery, regarding which a detailed description will be found in paragraph 10.

292

301

[77]

302

The people live in regular villages on fixed sites which have not altered, where, as a rule, the family tombs are standing. The houses are built in the shape of a shell, the houses being divided into three compartments,—the *Shyngkup*, or porch, where axes and *dhas*, and sometimes fowls, are kept; *nongpei*, or centre room, which is used for cooking and sitting in; and *nongpei*, or inner room, where the people sleep. The houses are low, with grass roofs reaching nearly to the ground, the beams are of hewn timber, the walls are of either planks roughly hewn or of reeds or split bamboos plastered with clay. The Khasis' houses generally have beneath them raised seats fixed from the ground level,

302

St Gordon G-3 (no date) 1904 AR7 Khasi AR7

—the *Nongkup*, or porch, being built with the ground. The *nongpoi*, or 342
entire room, is approached by a flight of steps. There are no windows,
except one, which is hung on one side to admit light and air,—this is
called the *ponphai*. Both Khasis and Syntengs, like other Indo-Chinese 524
room, are much addicted to gambling, and drinking to excess is a 272
national vice. Christianity has, through the agency of the Welsh Col- 191
vinistic Mission, gained a very striking extension, and may be said in- 171
deed to be becoming the whole nation. Schools are numerous, and are
pretty well attended by girls as well as boys. The Christians, and
those who have come under the influence of Christianity, have adopted
a high standard of comfort, and their houses resemble English cottages
more nearly than the huts with which one is familiar in India.

Agriculture.—The Khasis do not use the plough; they cultivate their 241
fields with a peculiar-shaped hoe, or *mokkhow*. They cultivate rice in
the valleys, the rice being sown broadcast and the fields irrigated often
after considerable labour. They also cultivate hill rice on the sylands,
which they sow broadcast. The potato, which was introduced into the 199
Khasi Hills by Mr David Scott about the 429
year 1831,[1] is extensively cultivated and forms
one of the principal articles of export. *Jaitia-*
kaw (*Coix lachryma*), several kinds of millet, Indian corn, the *Sidpi-*
lang (*Plectogyna mollis*), are also largely cultivated. The valleys on the 245
southern slopes of the hills have extensive orange groves, the oranges,
especially those grown in the neighbourhood of Shella, being famous for
their quality. The betel, vine, and areca nut are also largely grown on
the southern side of the hills and in the low valleys, these plantations
being irrigated by elaborate systems of aqueducts. The leaf of the bay-
tree (*Tejpatta*) is collected, and is exported to the Sylhet plains. The 428
Syntengs differ from the Khasis, in that they make use of the plough.
Both Khasis and Syntengs are industrious cultivators, and they possess
a certain rough and ready knowledge of the uses of manure. A more
detailed description of agriculture in these hills will be given in the
monograph.

3. *Matriarchal customs and law of inheritance of property.*—The 611
mother is the head of the house, and in both owner and the custodian of 428
the family property so long as she lives. Males can own no property
amongst either Khasis or Syntengs except self-acquired property. On
the death of the mother, in the case of the Khasis, the family property
passes to the youngest daughter. According to some authorities, how-
ever, the property would in practice be divided amongst all the survi-
ving daughters. Failing daughters, the property passes to the youngest
male, and failing a male, to the youngest female cousin. The same

THE KHASI HUTS OF MAWTHLANG

BY

RAI KHOBRA MUKHERJEE, RAI CHANDRA DUTT, SAILI. RAI CHAUDHURI, SAMIR GUPTA AND KUMARA DEBGUPTA

1[illegible] Post-Graduate students of the Department of Anthropology of the University of Calcutta are expected to do a certain amount of field work for practical training. In 1940 a Khasi village was studied by us, the students of the Post-Graduate class, as part of our training, under the guidance of Prof. K. P. Chattopadhyay, the Head of the Department of Anthropology, whom we have to thank also for the photographs used for this paper. This note on Khasi house structure is based on our work in the village of Mawphlang, the headquarters of the Khasi State of this name, in the Khasi Hills, Assam. Our studies included a survey of the village and its house types. Particular attention was paid to the structure of the old type of Khasi house.

192. Gurdon in his book on the Khasis of Assam describes the Khasi hut as elliptical in shape. But in Mawphlang we found that they can be more strictly said to be "U"-shaped, in ground plan the head of the "U" being the front, the two parallel arms the sides, and a straight line connecting the two ends of the two arms of the "U" the rear. We found this to be the type of most of the old houses of Mawphlang village. As is well known it is the custom among Khasis for the women of a family to live together, until the number of members increases so much that they cannot be provided with rooms in a single house. Then new houses are built. It is usual for a married couple with children to put up a separate

342. but for themselves. In all these cases the youngest daughter of the family who is known as the Ka Khadduh of the family must live in the old house and maintain the social and religious traditions of the family. In the village of Mawphlang we found that the houses of all the Ka Khadduhs like Ka Sadia, Ka Ilmiban and others, and also the old house of the wife of U. Sohmei, the myntri of the Mawphlang State, all belong to this "U"-shaped type. This association of Ka Khadduhs and "U" shaped huts suggests that this is the old type. The modern huts vary in their structure some being like modern bungalows common now-a-days in Shillong.

The old Khasi house, in general, can be described as follows :—

[343] [26] Generally there is a compound in front and a pigsty at one side, the whole site being enclosed by a fencing of reed and small pieces or of wooden planks or some such material. The hut as observed from outside is elliptical in front and box-shaped behind (as seen in the diagram). It is "U"-shaped in the ground plan. The roof of the hut is sloped on the two sides and spread out like a fan, in a semi-circle, in front.

343 342. The material used in the construction of the hut varies. In some of the old houses the walls were found to be made of blocks of stone with mud in the interstices serving the purpose of mortar. The roof had a bamboo frame covered with thatching grass. In other old huts the walls were not entirely made of stone blocks. In some we found the front portion made entirely of stone, the lower portions of the side and of the rear walls, up to a level of two to three feet, made of stone, the remaining portions being made of wooden planks or reeds covered with mud. In some modified huts again (either they were built later or the old huts were repaired) the entire rear wall except at the base and the upper portions of the sides were made of tinplates from used cans nailed to a frame. In some huts corrugated and galvanized iron sheets have been used. The material for the roof

also varies a good deal now-a-days, some being of corrugated galvanised iron sheets and others of flat tinplate sheets instead of

Ground plan

1. Ka Kynduh; 2. Ka Kynpaei;
3. Ka Kynmaw; 4. Ka Jing Kynsang;
5. Ka Kumpei; 6. Ka Dypei.

thatching grass. In some modified houses we found a porch added in front of the main door of the hut.

Entering the hut by the main door, the interior can be divided into two compartments, the front one which is on the ground level and the inner compartment which has a wooden floor raised to a height of about four feet supported on pillars of stone.

Construction of the frame of the Ka Kyndai

Thatching the Ka Kyndai

[Facing p. 180]

342 In some huts there is a wooden partition in between the two compartments, while in others it is absent. The front compart-

ELEVATION

ment on the ground floor is known in Mawphlang as Ka Kyndor, while the raised portion is known as Ka Nyngai. The Ka Kyndor is smaller than the Ka Nyngai and is roughly semi-circular in shape as it is formed of the front portion of the hut. Its floor is paved with stone or made of beaten earth. In some huts where there is a partition between the Ka Kyndor and the Ka Nyngai, there is a raised shelf in the Ka Kyndor which is really the projection of the wooden floor of the Ka Nyngai. From the Ka Kyndor the Ka Nyngai is reached by means of a few steps made of stone or a short staircase of wood. Where there is a partition between the Ka Kyndor and the Ka Nyngai there is a door in the middle of the wooden partition to enter the Ka Nyngai.

The Ka Nyngai is rectangular in shape and occupies about two-thirds of the area of the hut. The Ka Nyngai is not a single compartment but is divided into smaller compartments at its two sides and the rear by means of low wooden partitions.

342 But in some huts there are no such partitions and the demarcation is made by the pillars and beams which support the roof of the hut. The small enclosures at the two sides in the front portion are known locally as Ka Kynwin. The Ka Kynwin at the right hand side of the Ka Nympei close to the Ka Kyndor generally is used for storing water. The Ka Kynwin at the left hand side of the Ka Nympei just opposite to that for storing water is used as a larder for potatoes and other provisions. The enclosures at the rear of the Ka Nympei and those remaining at its sides are used as sleeping places. The sleeping places at the sides are known as Ka Ing Kyndong and those at the rear as Ka Rumpei. In most huts there is a window in the Ka Rumpei, high up in the back wall of the hut. In some huts there is a window in the front wall, in the Ka Kyndor. In many huts there is no window at all. Besides the main door in the Ka Kyndor, there is another door to the Ka Kynwin at the right hand side of the Ka Nympei. We were informed that in Cherra the part called Ka Kyndor is termed Ka Shyngkup, and Ka Kynwin as Ka Pyngdai.

343 354

In the centre of the Ka Nympei there is the hearth known as Ka Dypei. It is a rectangular space, about four feet and a half in length and three feet and a half in breadth, enclosed by timbers of wood. The floor of the hearth is paved with stone and mud. In the centre of it there are three small-shaped stone pieces which are known as Mawkynrew. On the Mawkynrew there is an iron triangle known as Ka Nar to hold the pots. The space of the Ka Nympei behind the hearth and in front of the Ka Rumpei is known as Jingbakhiewja.

352

Running round the edge of the Ka Nympei at a man's height there is a wooden frame supported on vertical posts; to this frame are fixed the partitions, separating the Ka Nympei from the Ka Kyndor, Ka Kynwin, Ka Ing Kyndong and Ka Rumpei. This wooden frame is known as Bahtynghan or Bahtynghu. Just above the Bahtynghan several stout beams of wood cross the house from side to side and rest on the

352 Bakiyaphan. They are known as Ukhong. The Ukhong above the Dypei are placed close to one another. A little apart from this row of Ukhongs, there is a single Ukhong parallel to the others which in some huts is hollowed out and is used as a receptacle for some household articles.

342 The frame of the roof as observed from inside consists of a central ridge pole running along the length of the hut and situated above the middle of it. From the ridge pole pairs of rafters diverge on two sides, their lower ends resting on the side walls of the hut. In front of the hut, the rafters are radially spread out from the anterior end of the ridge pole which is supported by a vertical pole known as Ript. These rafters rest on semi-circular wall at the head of the 'U'. The ridge pole and the rafters are known as Kynshi. Besides the rafters there are thinner wooden poles similarly arranged which further strengthen the frame of the roof. They are known as Ubnoh. The small rafters which are set cross-wise on the sloping Kynshi and form each series a 'U' round the ceiling are known as U Pynior. This frame for the roof is made on those huts where thatching grass is used, that is, in the old type of huts. In modern huts where corrugated or flat sheets of iron have been used instead of thatching grass such a frame is not required.

In the village of Mawphlang, we saw an old type hut, of Ka Lita repaired and re-built. At first the raised rectangular portion of the hut, the Ka Nympei, was reconstructed on a raised platform, with the frame for the roof above it. Then a semi-circular area was taken in front of the Ka Nympei about one-third the area of the inner compartment. Simultaneously with the making of the frame of the Ka Kynshor, the thatch was made in sections in bamboo frames. Then the roof of the hut was covered with these sections which were arranged in overlapping sheets (see plate). An old type Khasi hut is about thirty feet long; it is about twenty feet wide at the back.

343 Reference has been made to the usual pigsty adjoining each house. It is generally a small thatched shed with walls made of

wood and grass matting. The shed may be partitioned into two compartments one for keeping the cows and the other for keeping pigs. The upper portion of the pigsty is used for storing fuel in some houses. There is no uniformity in respect of this shed. 343

All the "U"-shaped huts found in the Mawphlang village were studied. Besides these typical "U"-shaped huts there are many other huts in the village which are rather flattened in front and can be said to belong to the flattened "U"-type. In the table given below the variations are shown in detail of the typical "U"-type huts and also of a flattened "U"-type hut belonging to Ka Lahirmon of Lyngdoh clan. It is peculiar that all these huts have their main door facing north. 342

Serial No.	Owner of the hut.	Materials used.	Partitions.
I.	Ka Shadem (Elder Sister).	Wall—Is made entirely of stone. Lower portions of sides and rear of stone. Upper portions of sides of wood, reed and wood. Upper portion of rear of thatch. Roof—Thatched entirely.	Partition between Ka Kynsiar and Ka Kynpai. No partition between Ka Kynpai and its stalls.
II.	Ka Sriw (Lyngdoh).	Wall—Wood with no outer covers of reed and thatch. Roof—Thatching grass.	No partition between Ka Kynsiar and Ka Kynpai, and between Ka Kynpai and its stalls.
III.	Ka Thiang	Wall—Planks covered with thatch. Roof—Thatched.	No partition between Ka Kynsiar and Ka Kynpai but the front Shongpiri gives it present.
IV.	Ka Pa (Lyngdoh)	Wall—Planks with outer thatchings. Very low stone wall all round, on one side. Roof—Thatched.	No partition between Ka Kynsiar and Ka Kynpai.
V.	Ka Lu (Sawi)	Wall—Low stone wall all round. Upper portions of front of reed and wood. Upper portions of side and rear of planks with outer cover of thatch. Roof—Thatched.	Partition between Ka Kynsiar and Ka Kynpai.

Serial No.	Owner of the hut.	Materials used.	Peculiarities.
VI.	Ka Ini (Khasi Dumpep).	Wall—Front, sides, and lower portions of rear of stone. Upper portions of rear of flat tinned sheets. Roof—Thatched.	Same as above.
VII.	Ka Ko (Lyngdoh).	Wall—Front, sides, and lower portion of rear of stone. Upper portion of rear of flat tinned sheets. Roof—Thatched.	Partition between Ka Kyndor and Ka Nyngei. In front of the main door a porch has been added,—a two-sloped tin shed resting on four wooden pillars.
VIII.	Ka Sadia (Lyngdoh).	Wall—Front and lower portions of sides and rear of room. Upper portion of left wall of flat tinned sheets. Upper portions of right wall and rear of thatch. Roof—Thatched.	No partitions.
IX.	Ka Pyn (Khasi Sawai).	Wall—Front and lower portions of sides and rear of room. Upper portions of sides of wood, bamboo, and mud. Upper portions of rear of thatch. Roof—Sloping sides of corrugated sheets. Front thatched.	Partition between Ka Kyndor and Ka Nyngei. No partition between Ka Nyngei and its underroom.
X.	Ka Kia (Lyngdoh).	Wall—Low stone walls all round. Roof—Thatched.	
XI.	Ka Kiah (Kup Thap).	Wall—Front entirely of stone. Lower portions of sides and rear of room, upper portions of planks. Roof—Flat tin plates.	Partition between Ka Kyndor and Ka Nyngei, and between Ka Nyngei and its underroom. One window in Ka Nyngei.
XII.	Ka Sirkan (Lyngdoh).	Wall—Stone all round. Roof—Corrugated tin sheets.	All the partitions present. Two windows at the head of the "U" by the two sides of the main door. One window at the back of Ka Nyngei on the left side of it.
XIII.	Ka Ka (Lyngdoh).	Wall—Lower portions of stone. Upper portions of sides of bamboo and mud. Upper portion of rear of tinned sheets. Roof—Thatched.	No partition between Ka Kyndor and Ka Nyngei.

Serial No.	Owner of the hut	Material used	Partitions
XIV.	Ka Skyrapah Lyngdoh.	Wall—Front, lower portion of stone. Upper portion of rear of ... sheets. Roof—Corrugated iron.	Partition between Ka Kyndor and Ka Kyrpen. A porch in front of hut similar to that in Ka Ri's hut.
XV.	Ka Tai Lyngdoh	Wall—Front portions of lower sides of stone. Upper sides of bamboo and mud. Some portion of rear ... sheets. Roof—Entirely of thin tinplate.	
XVI.	Ka Pahun (Khar Dohling).	Wall—Front, lower portion of stone. Upper portion of rear of flat ... sheets. Roof—Corrugated iron.	No partition between Ka Kyndor and Ka Kyrpah. No stage in Ka Kyndor to match Ka Kyrpah. A small porch in front of main door as in the hut of Ka Ka.
XVII.	Ka Dienbon (Lyngdoh.)	Wall—Lower stone all round, upper portions of corrugated iron sheet. Roof—Corrugated iron.	Small opening in the rear wall.
XVIII.	Ka Wer (Khar Wankhar).	Wall—Same as ... Roof—Same as ... iron.	
XIX.	Ka Kyrbon (Lyngdoh).	Wall—Low stone round all ... Upper portion and front of ... sheets. Type of rear of ... corrugated Roof—all tinplate.	Partition between Ka Kyndor and Ka Kyrpah. Small porch in front of main door as mentioned in some huts previously.
XX.	Ka Lotiness (Lyngdoh)	Wall—Low stone round all ... Upper portion of corrugated ... Roof Corrugated iron.	No partition between Ka Kyndor and Ka Kyrpah.

It has already been said that the Khasi house type is now changing. Some such changes have been noted in the table, such as, the addition of a porch, the ground plan of one hut changing into a flattened 'U,' and the extensive use of flat or corrugated iron sheets in place of thatch. As mentioned previously besides these typical 'U'-type huts, in many other huts the bend of the 'U' in front has been flattened but the oval roof in front is present. This is quite common. In other modified

342 huts the ground plan is entirely rectangular. In this type of huts the materials used are also different, the corrugated sheets and wooden planks being more used than blocks of stone and thatching grass. The inner apartments, however, conform to the old plan. In the market place of the village there are some houses which are two-storied, the front of the ground floor of which have been utilised for shops. These houses do not at all conform to the old 'U'-type but are square or rectangular in
342 ground plan. Near the market place there are three houses
177 of well-to-do Khasis which resemble the bungalows of Europeans of Shillong (and of the Mission house at Mawphlang) in their structure and material. In these modern houses unlike the old ones the main door faces the street. The mysir U. Suburai who is one of the well-to-do persons of Mawphlang village has his old house (that is, the old house he put up for his wife after marriage) of the 'U'-type, the description of which has been given in the preceding table under the name of the owner, the wife of U Suburai, Ka Shyengeh. But their new house which has been added to their old one in front of it is altogether of the bungalow type. This new house is entered from a porch in front, leading to the central room which is used as parlour. The mysir generally sits here with his friends, round the fire-place, which is not a Dypai but a hearth in European style. The kitchen is beyond this room. Bedrooms open from the drawing room to the sides.

342 A plan of the village showing the distribution of the various
361 types of hut in Mawphlang is given below. From the plan it
177 will be found that out of the 100 houses in the village, inhabited at present, the typical 'U'-type of huts form about 11·3 per cent.; the flattened 'U'-type about 33·0 per cent.; the intermediate type, which has totally given up the 'U'-shaped ground plan but has its interior of the old type, about 27·5 per cent. and the English bungalow type about 28·2 per cent. This data shows how rapidly the old type of Khasi hut is now changing.

Shella

Gudabway forms a more marked endogamous community, through being cut off geographically and economically from the rest of the Khasi, and socially from the neighbouring Hindu people.

The Economy and the People.

Shella lies along the upper part of the Shella River and stretches upwards along the steep slope, looking down towards the Bengal plain. The climate of this part of the hills is considered to be one of the worst in tropical India for human habitation. The Bengal plain, though warmer than this area, is considered more healthy. This border land is the area of malaria, typhoid, black fever, cholera, etc. None of the Bengalee peasants dare to live in such an area. However, it is the most fertile for products such as betel-nuts, pathaw, oranges, bananas and pineapples, and it also produces limestone. These people seem to prefer to settle in this area and to enjoy its prosperity, at the expense of human lives every year, especially between March and September, the inhabitants suffer from various fevers and dysentry and other diseases, many of the weaker facing death.

Before the Partition of India and Pakistan, the products of Shella were carried down the Shella River to Sylhet, one of the biggest centres in East Bengal, which brought unimaginable wealth to the Shella people. Their houses were built by carpenters from Sylhet. The style and structure of these houses were exceptionally elaborate for the Khasi. They purchased vast rice fields in the plain, which used to be cultivated by Bengalee and Garo labourers engaged by them. These Khasi do not themselves know how to cultivate rice fields; they have always been managers or landowners. Their boys used to be sent to high schools and colleges in Sylhet. As a result of their trading with the Bengalee, many of them read and speak fluent Bengalee. There is no difference between their style of clothing and that of the Bengalee, though the women maintain their traditional dress in the Shella style.

They have thus been distinguished from the rest of the Khasi not only geographically, but also economically and culturally. Their personality also differs sharply from the rest of the Khasi. They are very sensible, and quick, a quality lacking among the Khasi of Sohkynduh and Kongkon. They are clever enough to deal with strangers. The upland Khasi say Shella people are very cunning. This remark shows one side of these people. They had to be cunning, since they traded with the Sylhet Bengalee who were said to be the most cunning of their race. Their role in the trade and in the history of the modernization of the Hills was considerable. For centuries they represented intellectual Khasi owing to their contact with Hindu civilization, while the Hills remained in darkness. They assumed an important role when the British established an administration in the Hills, and even up to now, many leading Khasi originated from this area, for instance, Lett Hall, the first interpreter [illegible] Magistrate among the Khasi; Mohan Ging, a lawyer and Member of the Legislative Assembly (the grandson of Jadow Roy); Nicholas Roy, Minister of Health and Prisons of the Assam Government, Member of the Legislative Assembly, and Missionary of the Church of God; R. R. Thomas (brother of Nicholas Roy), Principal of the Gauhati University, etc.

Through constant cultural contact with Hindu, and encouraged by their economic prosperity, the Shella Khasi, like the Jaintias, have been much influenced by Hindu culture. However, this does not mean that the people of Shella adopted the Hindu beliefs. Though there is a small Hindu shrine, and some ceremonial elements were borrowed from the Hindu, most of the

potable water supply. Villages are about two to 361
five miles apart, and have no boundary markers. In
the past, villages contained semipublic buildings and [944]
grounds: the home of the village priest (also the [443]
home of a chief if he resided in that village), the vil-
lage marketplace, and tree groves, cremation grounds, [778]
or other awesome spots that were believed to be [340]
inhabited by supernatural beings. Villages today may
have also one or more Christian churches, govern-
ment social welfare buildings, and schools. Formerly, [178]
villages were entered through a guarded gateway;
this is no longer the case, and paths feed into vil-
lages from all directions. Often several villages are
nucleated into one large unit, named and also de-
scribed as a "village." There were once defense units, [712]
but were so unobtrusive otherwise that institution-
alized rivalry obtained among the component vil- [628]
lages. Now, they have been integrated through the [178]
agency of all-village public services, especially [182]
schools. **Housing.** The traditional Khasi house is en- 342
tered through a door at the rounded end of a U-
shaped ground plan, and is about 20 feet at widest
extent, it is about 30 feet deep, and is elliptical or
longback in profile. Its walls are of stone blocks ce-
mented with mud. The roof of grass thatch, sup-
ported by a bamboo frame, overhangs the walls on
three outside, down to about three feet above the
ground. The house is divided into two parts: the
front one-third is on the ground level, floored either
with stone blocks or tamped earth, and is used for
storage of occupational instruments and as a shelter
for poultry. The rear two-thirds is raised four feet on
piles of stone blocks to a platform of planks, and
is partitioned into six rooms, comprising a kitchen,
areas for storage of food and water, and sleeping
quarters. Furniture is minimal, and the house is to- 352
tally undecorated. There are no windows, and no 335
smoke vents. A house generally has a companion 354
shed, walled of wood and grass matting and thatched 343
with grass. This serves as a pigsty, but it may be
partitioned also to house cows, and it may have a loft
for fuel storage. Compounds often contain garden 361
plots, and are fenced around with stone or bamboo
and mud. Nowadays, the traditional house has given 177
way to Western-style bungalows of wood and tin, 184
especially in and around Shillong. [Cf. Mukherjee et 342
al. 1943.]

ECONOMY. The Khasi economy is a market economy 241
based on agriculture, and most Khasis are primary 433
producers, sellers, middlemen, and/or providers of 443
services in connection with markets. Khasis are often [463]
multioccupational: they produce goods for partial sub-
sistence, and also play some part in trade. **Agricul-**
ture. On the Shillong plateau, the major field crops 241
are potatoes, maize, millets, and dry rice, still pro-
duced mostly through swidden farming, with a two- to
three-year period of fallow, but increasingly through
continuous use of a single field with the aid of ma-

household deities, and remedial and auxiliary deities. 776
Deities of the first two categories are simply aspects 771
of the high God or Goddess. ● The earth is peopled with two great orders of land demons and water demons who cause all undesirable, unnatural, and otherwise inexplicable events, acting either on their own or as instruments in the hands of sorcerers. Apart from caverns, both in nature and in dwellings, 767
Khasis attach supernatural significance also to seven 814
numbers, and to the colors white, black, and red. They hold especially important folk beliefs regarding 829
betel nut, paddy rice, gold and silver, and clothing.
Practitioners. The two classes of religious practitioners are the village or state priests and the sacrificers. 781
Both are male. They use the same divinatory tools, 783
experts of reading broken eggshells and the entrails 784
of cocks, and they both sacrifice cocks, hens, goats, pigs, and cattle. Their skills are not taught to them so much as picked up by observation and confirmed by demonstrations of efficacy. A priest is elected from among the men of his ab to direct his skills to the public good until he dies, and his rewards are institutionalized and come from the village or the state. A sacrificer acts for private persons or his groups, on call, and is recompensed by them personally with gifts in cash or in kind. The sacrificer is called upon to explain and then to ritually remedy every variety of misfortune, especially illness, though his powers are nowadays regarded with ambivalence, and he is widely suspected to become a sorcerer sooner or later. ● There are two major types of sorcerer. 756
One is the ritual specialist or sacrificer who secretly turns his skills from good to evil, manipulating demons to injure a person or his group, and acting always for himself alone out of considerations of jealousy or revenge. The other is normally a leading citizen, a woman who is so wealthy and successful that it is believed that she must keep a *thiw*, i.e. a creature which will bring her prosperity so long as she feeds it periodically with human blood. To provide this blood, the men of her household, or other males whom she bewitches with a special whistle, will indiscriminately murder anyone except a member of her matrilineage. The Jaintias have an analogue to the *thiw* in their *ioy*, except that the ultimate result is death from illness rather than murder. Minor witchcraft can be perpetrated by private keepers or persons with an evil eye, who are often women. [P. 112]
Ceremonies. The important traditional ceremonies were the life-crisis rituals relating to 815
pregnancy and childbirth, the naming of a child, and 816
death. Lesser ceremonies related to marriage and 817
divorce, and to housebuilding. All these rituals were 818
addressed primarily to the ancestors, and they are 819
still performed in modified form by many Khasis. ●
Other rituals, which were performed by groups such 778
as villages, sibs, local descent groups, or households, 779
were addressed to the ancestral aspects of the high 782

[illegible]

[illegible] The table shows clearly that the medical facilities [illegible] in these villages are far from satisfactory. [illegible] A village [illegible] of [illegible] villages has a dispensary within [illegible] the village or within a radius of five miles. Considering the lack of communication facilities and the hilly nature of the district even five miles is often too long a distance for a patient to go to the doctor or for a doctor to attend a patient. When the doctor has to cover long distances the charges become too high. As a result the poorer section is one of serious illness have to approach unqualified medical men which are is probably is already to depend upon the mercy of God. Even for quinine and other cheap medicines one has to go to a dispensary or a private qualified practitioner which costs. Especially the main difficulty lies is that the medical help received by the people from Government dispensaries are not often timely and adequate due to unavailability of a doctor and inadequacy of stock of medicines.

[illegible] 6.8 **Conclusion**.—Though conditions of housing, sanitation, etc., of the villages are described in village notes in the appendix, it will be [illegible] to make some general observations on the point. Unlike other hill tribes, the Khasis select their house sites on the hill slopes and level lands in the side of the hills as a protection from winds. From the fact that the villages are situated in the slopes one might be tempted to think that the sanitary and drainage system of the villages should be quite satisfactory. But in fact it is otherwise in many cases particularly in the case of big villages where too many families huddle up constructing their houses very close to each other thus practically converting the village into a slum. Many of the villages, due to their very location in groves surrounded by thick jungle do not get sufficient sunlight and as a result always remain damp, facilitating frequent incidence of cold and influenza. People assume the cult of nature in jungles and bushes to and to and the villages. Many of the villages are built on level lands full of swamps, and old old ponds, pools which provide good breeding place for mosquitoes. Cowsheds and pig sties are built close to the well-used sources which make the villages all the more dirty. Indeed, there are villages enjoying excellent sanitation and health but in majority of the villages there remains a lot to be done for improving the sanitary, drainage system, for educating the people to make their villages more hygienic. From the Government side also, adequate measures should be adopted to combat and eradicate malaria which is still raging there in the district. Sanitary, drinking water supply schemes should receive a high priority in a programme of developments.

[illegible] 6.9 **Housing**.—Majority of the houses in the hilly areas are made of thatch and bamboo with wooden planking in some or earthen floor. Walls are plastered with mud. In higher altitude houses are fairly roofed permanently on a pre-cution, spider wall and heavy rain. Some of these houses seems the shape of a half buried cylinder. Doors generally have only one opening through the main door, though some of them have another in their rear wall. Two generally centers with one small room. One who is not used to such environs wonder how the peasants, especially those from the plains of Assam, could feel comfortable. Groups of the [illegible] people particularly those on the road side, are fast in the modern style with G.I. roofing, plank floor, wall [illegible], [illegible]

[illegible] to the nature of his wife, or to her nearest relatives if there are no [illegible]. The rank and titles of a deceased male descend to his brother; when no brother exists, then to the male children of his mother's sisters (maternal cousins); should the maternal cousins have no male children living, then to the children male child of his sisters. When no relatives are to be found, the property of the deceased goes to the ruler of the country; or if a man dies leaving no relative other than wife and children, or no relatives on the mother's side, the property in this case also goes to the ruler, who, as the wife and children cannot preserve the rules of the deceased, takes charge of them, and for so doing takes all the property also. With regard to the inheritance of the Lower Ills or Shelli, the custom is as nearly as follows:—Property belonging to a subject of Shelli is divided into two classes:(1) Property inherited from ancestors, which descends to the nearest of kin or to the relatives of a deceased person who can perform his obsequies. (2) Property acquired during the lifetime of the holder, which is inherited by the children, whose duty it is to provide for the maintenance of their mother and the ceremonies at death.'

[illegible] Houses, Clothing and Food.—The Kiriisu and the Dyenegs are as a people prosperous. Common labourers, if adult males, can earn wages as high as one shilling per diem, and adult females as high as eightpence. The dwellings of the well-to-do classes are generally constructed of masonry, with flat-bed roof and plank floor, and divided into two or three rooms. The furniture consists of a bedstead (charpoi), a seat or two (peed), some cooking utensils, and a few boxes. The ordinary peasants and poorer classes construct their huts of stone, mud, or plank walls, with a thatch or tiled roof. These are lined with wooden platforms or bamboo planks placed on the ground to serve as beds. The food of the well-to-do classes consists of rice, fish when obtainable, fowl or meat, curry, vegetables, oil, bag's lard, fermented and spirituous liquors. It may be estimated that the living expenses of an average well-to-do family of this class would be about Rs. 25 or £1. per month, taking the price of consumption at Kiriisu prices. An ordinary husbandman or labourer lives on rice, dry fish, occasionally a little meat, oil, or bag's lard. Also lard, tobacco, and beer are essential to the comfort of all the hill people, who are inveterate drinkers of gin. They consumed at an early age, and are rarely seen without a gin leaf in their mouths; the females are quite

Of the sub-divisions of these people, the Khasi proper (74)--1911: 120,933--live in the Khasi

74. P.R.T. Gurdon, The Khasis (London, 1907), pp. 1 ff. about house construction pp. 30 ff.

Hills, the Kindred Systems in the Jaintia Hills. The Lyng Gam who are classified by Gurdon as half Khasi and half Garo live in the western part of the Khasi Hills, the people who inhabit the low hill country in the north of the district, which is usually called "Bhoi," are named the Bhoi. Many of them are really Nikir. My observations of the Khasi are limited to the surrounding of Shillong from where I visited the village of Mongkrem which is about 13 kilometers away (75).

75. Cf. G. Becker, Anthropos 4 (1909), pp. 932-902.

The place is located in a trough between low hills which are covered by large stone boulders. A small water course runs through the village. The huts are partly built along the slopes of the hills which surround the village. The houses (Plate X, 4) all stand on small plots of land which are separated from each other by low stone walls; a narrow passage leads to them from the front side. Sometimes this passage is completely missing, in which event one has to climb over the wall. The houses stand on foundations of layers of irregular stone boulders. The walls are made of wooden boards--sometimes of bamboo--and are covered on the outside by grass. Grass is also used for roofing. Each strand is tied individually to bamboo poles, as in Burma (not as in Bengal where it is squeezed together between bamboo poles). Especially typical is the form of the roof; it is high and steep in the middle and the roof ridge is curved. The roof slopes down

pg 90 down /231/ toward the front in a broad curve, projects here quite a bit beyond the front of the house and covers the stone terrace before the entrance, which is supported by posts, where the occupants customarily sit during the daytime. Firewood is also piled up here at the sides. In the rear the roof ridge is very little--or not at all--curved; the general impression which the house makes through its roof form has been compared with a pig which stands with bowed head before the fodder trough. Generally speaking, the Khasi houses are not very large. I did not see any houses longer than from 6 to 9 meters and with a width of from 3 to 5 meters. However, according to Gurdon (p. 30) there are sometimes houses with a length of more than 20 meters. The interior is completely dark. Sometimes a small window at the side--an innovation--or a second side entrance allows some light to filter in. From the roofed terrace one enters first an anteroom which contains at both sides provisions, potatoes, and also wood. A board wall which is closed on top by a wooden grate, where light and air can pass through, separates this anteroom from the main room; upon entering one has to walk up a few steps or climb over a high threshold. pg 204 In the middle, toward the rear, is the fireplace. If the owner has a distilling license from the pg 213 British authorities (76) the distilling vessels

76. The restriction through licenses to counteract a little the consumption of alcohol, exists only in the area of Shillong. Otherwise the brandy production by the Khasi is not regulated.

for the preparation of rice or millet brandy are always kept here. The people have a strong preference for alcohol and especially on bazaar days it is no rarity to see tipsy people. I observed this particularly at the bazaar in Nong-

area. Before I could enter a hut the occupants had to remove a man who was dead drunk. Over the fireplace hangs a rack on which wood is piled up for drying; also food provisions, rice, etc. are kept dry here during the rainy season. Behind it a rack made of sturdy beams runs straight through the center and sometimes extends along the sides. On it all kinds of household items are kept. In the better houses the best dishes of shiny, polished brass and china are displayed here. This rack also serves as a partition behind which, on the sides and at the rear wall of the house, are the sleeping accommodations. Considering the very unprepossessing physical appearance of the people, it is surprising how orderly and clean the houses are kept inside. In the principal towns the well-to-do have already adopted the brick building and European comfort. With the Lungum and the Khel, however, we still find the pile dwelling (77). The houses

77. Gordon, ibid., p. 32. There it is mentioned (above) that in some villages of the subdivision of the Nar pile dwellings are built because the main part of the house rests on firm ground on the mountain side and then extends on piles over the slope. (Cf. the Gara.) The same people still use the bachelor house.

have a length from 10 to 12 meters with a veranda which among the Lungum is in front, among the Khel in the rear of the house. These people still practice migratory agriculture and therefore move their flimsily constructed houses every two or three years when they change to new fields. It follows that the Khel house, as described above, represents an advanced construction method. That in earlier days bamboo construction was

K house with its curved roof form reflects the
[77] building style of the Bengali, who also in other respects influenced the customs of the Khasi (79).

79. To be sure the roof ridge of the Bengal hut is evenly curved toward both sides and the entrance is from the broad side. This roof style is a distinctive architectural theme with temples and tombs of Bengal, as Monmohan Chakravarti in "Bengali Temples and Their General Characteristics" Journal and Proceedings of the Asiatic Society of Bengal 5 (Calcutta, 1909), p. 160 explains in detail. But whether the relation with the Pallava architecture of South India exists, as conjectured here on p. 167, seems to me very doubtful.

or whether the roof, sloping down in front and projecting broadly over the entrance wall must be considered as a modification of the veranda awning of the pile dwellings.

Shillong is excellent, the flavour being quite as good as that of English honey. Under "Miscellaneous Customs connected with Death" will be found a reference to the statement that the dead bodies of Siems used to be embalmed in honey. The existence of the custom is generally denied by Khasis, but its former prevalence is probable, as several trustworthy authors have quoted it.

HOUSES.

The houses of the people are cleaner than might be supposed after taking into consideration the dirtiness of the clothes and persons of those who inhabit them. They are as a rule substantial thatched cottages with plinth or stone walls, and raised on a plinth some 2 to 3 ft. from the ground. The only window is a small opening on one side of the house, which admits but a dim light into the smoke-begrimed interior. The houses are so low that it is impossible for a person of ordinary stature to stand erect within. The fire is always burning on an earthen or stone hearth in the centre. There is no chimney, the smoke finding its exit as best it can. The firewood is placed to dry on a swinging frame above the hearth. In the porch are stacked fuel and odds and ends. The pigs and calves are generally kept in little houses just outside the main building. The Khasi house is oval-shaped, and is divided into three rooms, a porch, a centre room, and a retiring-room.

In olden days the Khasis considered nails sang, or taboo, and only used a certain kind of timber for the feeder which surrounds the hearth; but they are not so particular now-a-days. In Mawkhar, Cherrapunji, and other large villages, the walls of houses are generally of stone. In Cherrapunji the houses are frequently large, but the largest house I have seen in the hills is that of the Doloi of Sohtinga in the Jaintia Hills, which measures 74 ft. in length. The house of the Siem Priestess at Smit in the Khasi Hills is another large one, being 61 ft. long by 30 ft. broad. In front of the Khasi house is a little open-fronted or on two sides, but open towards the village street. The

but for themselves. In all these cases the youngest daughter
342 of the family who is known as the Ka Khadduh of the family must live in the old house and maintain the social and religious traditions of the family. In the village of Mawphlang we found that the houses of all the Ka Khadduhs like Ka Sadie, Ka Ibanlon and others, and also the old house of the wife of U. Sabuni, the myntri of the Mawphlang State, all belong to this "U"-shaped type. This association of Ka Khadduhs and "U" shaped huts suggests that this is the old type. The modern huts vary in their structures some being like modern bungalows common now-a-days in Shillong.

The old Khasi house, in general, can be described as follows :—

[343] [26] Generally there is a compound in front and a pigsty at one side, the whole site being enclosed by a fencing of reed and small plants or of wooden planks or some such material. The hut as observed from outside is elliptical in front and box-shaped behind (as seen in the diagram). It is "U"-shaped in the ground plan. The roof of the hut is sloped on the two sides and spread out like a fan, in a semi-circle, in front.

333 The material used in the construction of the hut varies. In
342 some of the old houses the walls were found to be made of blocks of stone with mud in the interstices serving the purpose of mortar. The roof had a bamboo frame covered with thatching grass. In other old huts the walls were not entirely made of stone blocks. In some we found the front portion made entirely of stone, the lower portions of the side and of the rear walls, up to a level of two to three feet, made of stone, the remaining portions being made of wooden planks or reeds covered with mud. In some modified huts again (either they were built later or the old huts were repaired) the entire rear wall except at the base and the upper portions of the sides were made of bamboo frame and cane tailed to a frame. In some huts corrugated and galvanized iron sheets have been used. The material for the roof

Bahumphan. They are known as Ukhung. The Ukhung above the Dypei are placed close to one another. A little apart from this row of Ukhungs, there is a single Ukhung parallel to the others which in some huts is hollowed out and is used as a receptacle for some household articles.

The frame of the roof as observed from inside consists of a central ridge pole running along the length of the hut and situated above the middle of it. From the ridge pole pairs of rafters diverge on two sides, their lower ends resting on the side walls of the hut. In front of the hut, the rafters are radially spread out from the exterior end of the ridge pole which is supported by a vertical pole known as Bijit. These rafters rest on semi-circular wall at the bend of the "U". The ridge pole and the rafters are known as Kynshi. Besides the rafters there are thinner wooden poles similarly arranged which further strengthen the frame of the roof. They are known as Ubnah. The small rafters which are set cross-wise on the sloping Kynshi and form each series a "U" round the ceiling are known as U Pynior. This frame for the roof is made on those huts where thatching grass is used, that is, in the old type of huts. In modern huts where corrugated or flat sheets of iron have been used instead of thatching grass such a frame is not required.

In the village of Mawphlang, we saw an old type hut, of Ka Lita repaired and re-built. At first the raised rectangular portion of the hut, the Ka Nyngei, was constructed on a raised platform, with the frame for the roof above it. Then a semi-circular area was taken in front of the Ka Nyngei about one-third the area of the inner compartment. Simultaneously with the making of the frame of the Ka Kynshir, the thatch was made in sections in bamboo frames. Then the roof of the hut was covered with these sections which were arranged in overlapping sheets (see plate). An old type Khasi hut is about thirty feet long; it is about twenty feet wide at the back.

Reference has been made to the usual pigsty adjoining each house. It is generally a small thatched shed with walls made of

wood and grass matting. The shed may be partitioned into two compartments one for keeping the cows and the other for keeping pigs. The upper portion of the pigsty is used for storing fuel in some houses. There is no uniformity in respect of this shed. 343

All the "U"-shaped huts found in the Mawphlang village were studied. Besides these typical "U"-shaped huts there are many other huts in the village which are rather flattened in front and can be said to belong to the flattened "U"-type. In the table given below the variations are shown in detail of the typical "U"-type huts and size of a flattened "U"-type hut belonging to Ka Lahiemon of Lyngkhi clan. It is peculiar that all these huts have their main door facing north. 342

Serial No.	Owner of the hut	Measurements	Peculiarities
I.	Ka Shadow Ohar Khonsi.	Wall—Six feet [illegible] of stones. Lower portion of sides and side of plinth. Upper portion of sides of wood, [illegible] wood. Upper portion of roof of thatch. Roof—Thatched [illegible].	Peculiarities between the Khonsis and the Kyngdoh, the peculiarities between the Kyngdoh and the [illegible] clans.
II.	Ka Sohe Lyngdoh.	Wall—Wood with no lower [illegible] of wood and thatch. Roof—Thatching grass.	The peculiarities between the Khonsis and the Kyngdoh, and between the Kyngdoh and the [illegible] clans.
III.	Ka Thomas	Wall—Plastered with thatch. Roof—Thatched.	The peculiarities between the Khonsis and the Kyngdoh but the main Kyngdoh given in [illegible].
IV.	Ka Pre Lyngdoh	Wall—Plastered with [illegible] [illegible] wood of [illegible] [illegible] [illegible]. Roof—Thatched.	The peculiarities between the Khonsis and the Kyngdoh.
V.	Ka Ka Khonsi	Wall—Lower [illegible] wall of [illegible]. Upper portion of sides and [illegible] of thatch. Roof—Thatched.	Peculiarities between the Khonsis and the Kyngdoh.

possible water supply. Villages are about two to two miles apart, and have no boundary markers. In the past villages contained ceremonial buildings and grounds, the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and two groves, cremation grounds, or other sacrificial spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway; this is no longer the case, and paths lead into villages from all directions. Often several villages are incorporated into one large unit, named and also described as a "village." There were once defense units, but now no significance attaches that institution, plural residy, obtained among the components villages. Now, they have been integrated through the agency of village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a T-shaped ground plan, and is about 20 feet or wider (which is about 30 feet deep) and a physical or lengthwise in profile. Its walls are of stone blocks or covered with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on three sides. Door to door there have been the ground. The house is divided into two parts, the front one-third is on the ground level (floored either with stone blocks or tamped earth) and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, area for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is dark, underventilated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for hay storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Westernized bungalows of wood and tin, especially in and around Shillong. (D. McKinnon et al. 1964.)

ECONOMY. The Khasi economy is a market economy, based on agriculture, and most Khasis are primary producers, artisans, middlemen, and/or providers of services in competition with markets. Khasis are also multioccupational; their produce goods for partial subsistence, and also plot some part to really lucrative ends. On the Shillong plateau, the major field crops are potatoes, beans, millets, and dry rice, and pineapple and mandarin orange. Formerly, with a hoe or three-tine pattern of hollow, but increasingly through continuous use of a single field with the aid of an

Ic Gawton E-4, 5 (no date) 1907 AR7 Khasi AR7

being in a position to help his descendant in times of trouble. The same thought underlies the extreme reverence with which *Ka Iawbei* is regarded. Thus we see a striking point of resemblance between the Khasi ancestor-worship and the ancient Shinto cult of Japan, as described by Mr. Lafcadio Hearn. *U Bnid-Sin*, or *u Kni Blogbah*, the first maternal uncle, i.e. the elder brother of *Ka Iawbei*, is also much revered. It will also be noticed under the heading of memorial stones that the great central upright monolith of the *mawbynna*, or memorial stones, is erected in his honour. The influence of the *kyi*, or mother's elder brother, in the Khasi family is very great, for it is he who is the manager on behalf of the mother, his position in the Khasi family being very similar to that of the *karta* in the Hindu joint family. It is on this account that he is so much revered, and is honoured with a stone which is larger than the other up-right memorial stones after death. It will be seen in the article dealing with "the disposal of the dead," that at Cherra, on the occasion of the burial of the ashes in the cinerarium of the clan, a part of the attendant ceremonies consists of the preparation of two effigies called *Ka Pawno* and *U Tyngkop*, intended to represent *Ka Iawbei* (the first mother) and *U Bnid-Sin* (the first maternal uncle). The Wars of Nongjri have a custom peculiar to themselves. They erect small thatched houses in their compounds, which they call *sing lawid*. When they worship their ancestors they deposit offerings of food in these houses, the idea being that the ancestors will feed on the offerings. These Wars do not erect memorial stones, nor do they collect the ashes of the clan in a common sepulchre; they deposit the ashes in circular cineraria, each family, or *sing*, possessing one. It should further be noted with reference to the Khasi custom of *ai kaw*, or giving food to the spirits of deceased ancestors, that Dr. Frazer, in his "Golden Bough," has mentioned numerous instances of foodstuffs being offered to the spirits of deceased ancestors by the tribes inhabiting the Malay Archipelago. (See pages 462-463 of the "Golden Bough.") Some other points of similarity in customs have already been noticed between the Khasis and certain Malay tribes.

possible water supply. Villages are about two to
five miles apart and have no boundary markers. In
the past, villages contained compatible buildings and
grounds: the house of the village priest (also the
house of a chief if he resided in that village), the vil-
lage marketplace, and two green, cremation grounds,
or other ceremonial spots that were believed to be
inhabited by supernatural beings. Villages today may
have also one or more Christian churches, govern-
ment social welfare buildings, and schools. Formerly,
villages were entered through a guarded gateway;
this is no longer the case, and paths lead into vil-
lages from all directions. Often several villages are
unclustered into one large unit, named and also de-
scribed as a "village." There were two defense units,
but none so conclusive otherwise that institution-
al ties were obtained among the component vil-
lages. Now they have been integrated through the
agency of all-village public services, especially
schools. **Housing.** The traditional Khasi house is en-
tered through a door at the rounded end of a U-
shaped ground plan, and is about 20 feet at widest
center, 6 to about 30 feet deep, and is elliptical or
hogback in profile. Its walls are of stone blocks or
covered with mud. The roof of grass thatch, sup-
ported by a bamboo frame, overhangs the walls on
two sides, down to about three feet above the
ground. The house is divided into two parts: the
front one-third is on the ground level, floored either
with stone blocks or tamped earth, and is used for
storage of occupational instruments and as a shelter
for poultry. The rear two-thirds is raised four feet on
piles of stone blocks to a platform of planks, and
is partitioned into six rooms, comprising a kitchen,
areas for storage of food and water, and sleeping
quarters. Furniture is minimal, and the house is to-
tally undecorated. There are no windows, and no
smoke vents. A house generally has a companion
shed, walled of wood and grass matting and thatched
with grass. This serves as a pigsty, but it may be
partitioned also to house cows, and it may have a loft
for fuel storage. Compounds often contain garden
plots, and are fenced around with stone or bamboo
and mud. Nowadays, the traditional house has given
way to Western-style bungalows of wood and tin,
especially in and around Shillong. [Cf. Middleton et
al. 1961.]

ECONOMY. The Khasi economy is a market economy
based on agriculture, and most Khasis are primary
producers, sellers, middlemen, and/or providers of
services in connection with markets. Khasis are often
multioccupational; they produce goods for partial sub-
sistence, and also play some part in trade. Agricul-
ture. On the Shillong plateau, the major field crops
are potatoes, maize, millets, and dry rice, still pro-
duced mostly through swidden farming, with a two to
three-year period of fallow, but increasingly through
continuous use of a single field with the aid of ma-

disfigured from the practice. Adults will chew as many as four or five betel-nuts a day, with the usual accompaniment of *Pán* leaves. The estimated cost of maintaining an average family of the labouring class is about Rs. 8 or 16s. a month.

Towns: Shillong.—There are no towns in the usual acceptance of the word; but the chief places in the Hills, looked upon by the inhabitants as cities, are Shillong, Jowái, Cherrá Púnji, and Shellá. According to the Census of 1872, Shillong had only 1363 inhabitants, Cherrá Púnji 443, and Jowái 4502. Jowái, however, is a collection of rural hamlets, and the population of Shillong has entirely altered since the date of the Census. The latter place first became the Civil Station in 1864, in substitution for Cherrá Púnji; and when Assam was erected into an independent Province in 1874, it was selected as the permanent seat of the Local Government. The Chief-Commissioner resides there, and also the heads of all departments in the Administration. The area of the Station is 7 miles in length by 1½ to 1¾ miles in breadth. A considerable native population is already settled, and is increasing from day to day. One of the largest weekly markets is held in the *Bázár*; and with a view to facilitate access to the Station, which is the sanitarium for the Province of Assam, a cart road has recently been completed to Gauhátí on the Brahmaputra, which will tend to make the place more and more important. An excellent water supply is introduced into Shillong through an aqueduct which has its source in the neighbouring hill streams, and sanitary measures are carefully enforced. Large sums of money have annually been expended on the erection of the public buildings necessary for the offices of the administration. A printing-press has been established, from which issue all the official documents and reports of the Province. The climate is excellent, the temperature being more equable than that of any other hill station in India, and therefore admirably suited to the constitution of Europeans. There is a church at Shillong, and a chaplain on the Bengal establishment officiates both there and at Gauhátí. The cantonments were occupied in 1875 by the 43d Regiment of Assam Light Infantry, with three outposts. The strength was 9 European officers, 16 native commissioned officers, 80 non-commissioned officers, 772 fighting men, and 58 paid camp followers and non-combatants; grand total, 935. The total cost, including contingencies, was Rs. 183,190, or £18,319.

1:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

or official quadrangle of the Siem's Durbar. Another part of each in this house is furnished by the people of the State.

The houses of the well-to-do Khasis of the present day in Mawkhar and Cherrapunji are built after the modern style with iron roofs, chimneys, glass windows and doors. In Jowai the well-to-do traders have excellent houses of the European pattern, which are as comfortable as many of the European subordinates' quarters in Shillong. Some up-to-date families in Shillong and at Cherra allow themselves muslin curtains and European furniture.

The houses of the Pnar-Wáre are peculiar. The roof, which is thatched with the leaves of a palm called a *tyrsiew*, is long-backed and the eaves come down almost to the ground. There are three rooms in the Wáre as in the Khasi house, although called by different names in the Wáre dialect. The hearth is in the centre room. The houses are built flush with the ground and are made of bamboos. In the Wáre villages of Nongpi and Umiesh there are small houses erected in the compounds of the ordinary dwelling-houses called *ing lewid* (spirit houses). In these houses offerings to the spirits of departed family ancestors are placed at intervals, this practice being very similar to the more ancient form of Shintoism. In some Wáre villages there are also separate bachelors' quarters. This custom is in accordance with that of the Naga tribes. There is no such custom amongst the Khasi Uplanders. The Wáre houses are similar to those of the Pnar Wáre, except that a portion of the house is generally built on a platform, the main house resting on the hill-side and the portion on the platform projecting therefrom, the object being to obtain more space, the area for houses in the village sites being often limited owing to the steepness of the hill-sides.

The Bhoi and Lyngam houses are practically similar, and may be described together. They are generally built on fairly high platforms of bamboo, are frequently 30 to 40 ft. in length, and are divided into various compartments in order to suit the needs of the family. The hearth, which is of earth, is in the centre room. There is a platform at the back of the Lyngam house, and in front of the Bhoi house, used for drying paddy, spreading chillies, &c., and for sitting on when the day's

Ic Gordon E-4, 5 (no date) 1907 ABT Khasi ABT

589 dition that she does not remarry; the idea being that so long as
765 the bones remain in the widow's keeping, the spirit of her husband is still with her. On this account many wives who mourn their husband's memories, and who do not contemplate remarriage, purposely keep the bones for a long time. If a
587 765 widow marries, even after the customary taboo period of one year, whilst her deceased husband's bones are still in her keeping, she is generally looked down upon. Her children by such a
[345] case perform the ceremony of handing over the bones of their father to his clan in a building specially erected for the purpose. The widow cannot enter therein, or even go near it, whilst the ceremony is proceeding, no matter whether the *ding-sang*, or the price for removing the taboo after a husband's death, has been
586 paid to the husband's clan or not. There is no evidence to show that polyandry ever existed amongst the Khasis. Unlike the Thibetans, the Khasi women seem to have contented themselves always with one husband, at any rate with one at a time. Certainly at the present day they are monandrists. Polygamy does not exist amongst the Khasis; such a practice would naturally not be in vogue amongst a people who observe the matriarchate. There are instances, however, of men having wives other than those they have regularly married, and in the Wild country children by such wives enjoy rights to their father's acquired property equally with the children by the legally
582 married wife. As the clans are strictly exogamous, a Khasi
688 cannot take a wife from his own clan; to do this would entail
764 the most disastrous religious, as well as social consequences. For to marry within the clan is the greatest sin a Khasi can commit, and would cause excommunication by his kindred and the refusal of funeral ceremonies at death, and his bones would
[115] not be allowed a resting-place in the sepulchre of the clan. To
614 give a list of all the Khasi exogamous clans would perhaps serve
582 no useful purpose, but I have prepared from information kindly furnished me by the Siems of Khyrim and Cherrapunji, a list of the clans in those States which will be found in Appendices A and B. These will suffice as examples. It will be seen from the Cherra list that the different divisions of the Diengdoh clan, viz. Lalu, Diengdoh-bah, Diengdoh-kylla, are prohibited from intermarriage; this is due to those branches of the clan being

An excellent water supply is introduced into Shillong through an aqueduct which has its source in the neighbouring hill streams, and sanitary measures are carefully enforced. Large sums of money have annually been expended on the erection of the public buildings necessary for the offices of the administration. A printing-press has been established, from which issue all the official documents and reports of the Province. The climate is excellent, the temperature being more equable than that at any other hill station in India, and therefore admirably suited to the constitution of Europeans. There is a church at Shillong, and a chaplain on the Bengal establishment; officiates both there and at Cherra. The cantonments were occupied in 1873 by the 42d Regiment of Assam Light Infantry, with three outposts. The strength was 9 European officers, 18 native commissioned officers, 80 non-commissioned officers, 770 fighting men, and 98 paid camp followers and non-combatants; grand total, 955. The total cost, including contingencies, was Rs. 187,130, or £18,713.

later, but there is a small wood near there. 643
The market place is also often found under 34'
trees, at the edge of a forest or near the
memorial stones.

c) Market Huts. Usually the market is 643
held in the open air. Green offers places 347
to sit as well as places for laying out the
wares. But in many places there are also
market halls or market huts. These are
simple halls, open on all sides, made with a
framework of bamboo poles and a roof of
straw or palm leaves. The market huts or
market halls are built with square corners
and have gabled roofs. They offer the women
sellers protection from the sun or rain only,
but no other comforts. Neither tables nor
chairs nor other arrangements for displaying
wares are there. On the side where the wind
blows these market halls are often covered
with bamboo mats.

d) Choosing the Place for Selling. 643
The choice of the place for selling is left 964
up to the seller. Yet a certain division can
be recognized at every market. This division
could be called a division according to sex.
In the middle the food stuffs are usually
sold which the women take care of. Utensils
and cattle which are the business of the men,
are sold at the edges. Therefore there is a
definite arrangement to the market which is
taken for granted by the Khasis: in the middle
the women, outside the men (there is a similar
order for the dance): in the middle the feminine
sex, outside the masculine sex. The indivi-
dual types of wares have their definite
places, although individual sellers are not
assigned definite places.

The women settle down at any place that 643
seems good to them after their arrival at the
market. They spread out in front of them the

McGordon E-4, 9 (no date) 1907 ART Khasi ART

and other trees. These are the sacred groves. Here the villagers worship U syngkow U kong, the tutelary deity of the village. These groves are taboo, and it is an offence to cut trees therein for any purpose other than for performing funeral ceremonies. The groves are generally not more than a few hundred yards away from the villages. The villages of the Syntengs are similar in character to those of the Khasis. The War villages nestle on the hill-sides of the southern border, and are to be seen peeping out from the green foliage with which the southern slopes are clad. In the vicinity of, and actually up to the houses, in the War villages, are to be observed large groves of areca-nut, often twined with the *pan* creeper, and of plantain trees, which much enhance the beauty of the scene. Looking at a War village from a distance, a darker shade of green is seen; this denotes the limits of the extensive groves where the justly celebrated Khasi orange is grown, which is the source of so much profit to these people. The houses in the War villages are generally closer together than those of the Khasis, probably owing to space being limited, and to the villages being located on the slopes of hills. Generally up the narrow village street, and from house to house, there are rough steep stone steps, the upper portion of a village being frequently situated at as high an elevation as 200 to 300 ft. above the lower. In a convenient spot in a War village a clear space is to be seen neatly swept and kept free from weeds, and surrounded with a stone wall, where the village tribunals sit, and the elders meet in solemn conclave. Dances also are held here on festive occasions. At Nongjri village there is a fine rubber tree, under whose hollow trunk there are certain sacred stones where the priest performs the village ceremonies.

The Bhoi and Lyngngam villages are built in small clearings in the forest, the houses are close together and are built often in parallel lines, a fairly broad space being reserved between the lines of houses to serve as a street. One misses the pretty gardens of the War villages, for Bhois and Lyngngams attempt nothing of the sort, probably because, unlike the Khasi, a Bhoi or Lyngngam village never remains more than two or three years in one spot; generally the villages of these people are in the vicinity of the forest clearings, sometimes actually in the midst

[41] so take such a clan mother with the name Ka Ring Lan. She has two
[72] sons and five daughters, and in addition two brothers and two sisters who are all married. Also each of the five daughters and two sisters has four children. These forty-six people live with the clan mother and form the family clan of the Lan. To these we also add the sons
[72] and brothers, the nephews and grandsons, but not their children. The latter have nothing to do with the family Lan but belong to the family clan of their wives, live with that clan and are counted in it. Likewise neither the husband of Ka Ring Lan, nor the husbands of the various daughters, sisters, nieces, and granddaughters belong here. They are all counted with their own clans, live and work with them according to Khasi customs, and only visit their wives occasionally perhaps after dark.

63] The entire clan-family of Lan is housed in 5 or 6 huts, which all
• 157] stand next to each other in a semicircle or are built one above the other on the slope of a hill, according to the character of the land. A
[241] garden frequently surrounds them in which maize, sweet potatoes, potato-like roots of bulb-or and tubers, bananas and, on the southern slopes of the Khasi Mountains, also coffee, pineapples, and other fruits are cultivated. A circle of bamboo cane that is so important for building purposes, household objects, and /156/ implements surrounds the garden and huts. This bamboo cane grows up as thick as an arm to a height of 30 or 35 meters and at the same time forms a good protection against bad weather. A wall (mawtha) of thrown-up earth encloses everything, forming an enclosed farm, prevents unimpeded access, and protects cattle and crops from the attacks and devastations of wild animals.

What is considered the family property of such a clan? Primarily
123 it is also land, the garden, the rice fields, woods, fallow mountain and grazing lands. On the southern slopes of the Khasi Mountains there
[242] are fields for the cultivation of rape, orange groves, laurel groves, plantations of betel palms and of pepper leaves which far and wide are so highly treasured for betel chewing as a source of pleasure. (2)

2/. Cf. Becker, Im Stromtal des Brahmaputra, /In the River Valley of the Brahmaputra/ (Munich, 1952), pp. 207 ff.

[311] Usually there is so much land available that the family-clan can nourish itself properly and also increase in number

423 According to its size and wealth a family clan also owns a
231 corresponding number of cows, oxen, hens, pigs, and goats. Neither the milk nor the flesh of the cows is used. They are kept for the

but for themselves. In all these cases the youngest daughter
342 of the family who is known as the Ka Khadduh of the family
must live in the old house and maintain the social and religious
traditions of the family. In the village of Mawphlang we found
that the houses of all the Ka Khadduhs like Ka Sadia, Ka
Thaslum and others, and also the old house of the wife of
U. Sukawi, the myntri of the Mawphlang State, all belong to
this "U"-shaped type. This association of Ka Khadduhs and
"U" shaped huts suggests that this is the old type. The modern
huts vary in their structure some being like modern bungalows
common now-a-days in Shillong.

The old Khasi house, in general, can be described as
follows :—

(343) (26) Generally there is a compound in front and a pigsty on
one side, the whole site being enclosed by a fencing of reed and
small plants or of wooden planks or some such material. The
hut as observed from outside is elliptical in front and box-shaped
behind (as seen in the diagram). It is "U"-shaped in the ground
plan. The roof of the hut is sloped on the two sides and spread
out like a fan, in a semi-circle, in front.

The material used in the construction of the hut varies. In
343 some of the old houses the walls were found to be made of blocks
342 of stone with mud in the interstices serving the purpose of
mortar. The roof had a bamboo frame covered with thatching
grass. In other old huts the walls were not entirely made of
stone blocks. In some we found the front portion made entirely
of stone, the lower portions of the side and of the rear walls,
up to a level of two to three feet, made of stone, the remaining
portions being made of wooden planks or reeds covered with mud.
In some modified huts again (either they were built later or the
old huts were repaired) the entire rear wall except at the base
and the upper portions of the sides were made of tinplates from
used cans nailed to a frame. In some huts corrugated and
galvanized iron sheets have been used. The material for the roof

of them, more especially when the latter are situated in places where jungle is dense, and there is fear of attacks from wild animals. In the Lyngpun village is to be seen a high bamboo platform some 20 to 30 ft. from the ground, built in the midst of the village, where the elders sit and gossip in the evening.

All the villages, Khasi, War, Lyngpun and Bhoi, swarm with pigs, which run about the villages unchecked. The pigs feed on all kinds of filth, and in addition are fed upon the wort and spent wash of the brewings of country spirit, or rice beer, the latter being carefully collected and poured into wooden troughs. The pigs are of the usual black description seen in India. They thrive greatly in the Khasi villages, and frequently attain extreme obesity.

In the Khasi villages of the high plateaux are often seen large potato gardens, the latter being carefully protected from the inroads of pigs, calves, and goats by dry dikes surmounted by hedges.

I noticed an interesting custom at a Bhoi village in Nongpoh of barricading the path leading to the village from the forest with bamboo palisading and bamboo *chevaux de frise* to keep out the demon of cholera. In the middle of the barricade there was a wooden door over which was nailed the skull of a monkey which had been sacrificed to this demon, which is, as amongst the Syntengs, called *Kblaw*.

FURNITURE AND HOUSEHOLD UTENSILS.

As in the case of houses, so with reference to furniture, the influence of civilisation shows many changes. The Khasi of the present day who lives in Mawkhar * has a comfortable house regularly divided up into rooms in the European style with even some European articles of furniture, but owing probably to the influence of the women, he still possesses several of the articles of furniture which are to be met with in the houses of those who still observe the old style of living. Let us take the furniture of the kitchen to begin with. Above the hearth is slung by ropes of cane a swinging wooden framework

* Mawkhar is a suburb of Shillong, the headquarters station.

1:Gordon E-4, 5 (no date) 1907 A87 Khasi A87

blackened with the smoke of years, upon which are spread the faggots of resinous fir-wood used for kindling the fire. Above this again is a wooden framework fixed on to the beams of the house, upon which all sorts of odds and ends are kept. Around the fire are to be seen small wooden stools, upon which the members of the household sit. Up-to-date Khasis have cane chairs, but the women of the family, true to the conservative instincts of the sex, prefer the humble stool to sit upon. Well-to-do Khasis nowadays have, in addition to the ordinary cooking vessels made of iron and earthenware, a number of brass utensils. The writer has seen in a Khasi house in Mawkhar brass drinking vessels of the pattern used in Orissa, of the description used in Manipur, and of the kind which is in vogue in Sylhet. The ordinary cultivator, however, uses a waterpot made from a gourd hollowed out for keeping water and liquor in, and drinks from a bamboo cylinder. Plates, or more properly speaking dishes, are of several kinds in the houses of the rich, the two larger ones being styled *ka pliang kyrkhei* (female) and *ka pliang shyawang* (male). Needless to say, the first mentioned is a larger utensil than the latter. The ordinary waterpots, *u khiew pliang kyrkhei* and *u khiew pliang shyawang*, are made of brass, the former being a size larger and having a wider mouth than the latter. The pot for cooking vegetables is made of iron. Another utensil is made of earthenware; this is the ordinary cooking pot used in the houses of the poor. Brass spoons of different sizes are used for stirring the contents of the different cooking utensils, also a wooden spoon.

In the sleeping-rooms of the well-to-do there are wooden beds with mattresses and sheets and pillows, clothes being hung upon clothes-racks, which in one house visited were of the same pattern as the English "towel horse." The ordinary cultivator and his wife sleep on mats made of plaited bamboo, which are spread on the bare boards of the house. There are various kinds of mats to be met with in the Khasi houses made of plaited cane, of a kind of reed, and of plaited bamboo. The best kind of mat is prepared from cane. In all Khasi houses are to be seen *ki kwap*, or rain shields, of different sizes and sometimes of somewhat different shapes. The large

shield of Chamyong) is used as a protection from rain. Those of Mahrawan and Mawlong are each of a peculiar pattern. Smaller shields are used as protections from the sun or merely for show, and there are specially small sizes for children. Then there are the different kinds of basket (ki khak) which are carried on the back, along across the forehead by a cane head-strap. These, again, are of different sizes. They are, however, always of the same conical shape, being round and broad-mouthed at the top and gradually tapering to a point at the bottom. A bamboo cover is used to protect the contents of the basket from rain. There is a special kind of basket made of cane or bamboo with a cover, which is used for carrying articles on a journey. These baskets, again, are of different sizes, the largest and best that the writer has seen being manufactured at Raneiai, in the south-western portion of the hills. Paddy is husked in a wooden mortar by means of a heavy wooden pestle. These are to be seen all over the hills. The work of husking paddy is performed by the women. A bamboo sieve is sometimes used for sifting the husked rice, a winnowing fan being applied to separate the husk. The cleaned rice is exposed to the sun in a bamboo tray. Paddy is stored in a separate store-house in large circular bamboo receptacles. These hold sometimes as much as 30 maunds* of grain. Large baskets are also used for keeping paddy in. In every Khasi house is to be found the net bag which is made out of pineapple fibre, or of a stem, the Assamese rika (Boehmeria nivea). These bags are of two sizes, the larger one for keeping cowries in, the cowrie in former days having been used instead of current coin in these hills, the smaller for the ever necessary betel-nut. *Pân* leaves are kept in a bamboo tube, and tobacco leaves in a smaller one. Lime, for eating with betel-nut, is kept in a metal box, sometimes of silver, which is made in two separate parts held together by a chain. The box is called *ka shanam*, and is used all over the hills. This box is also used for divination purposes, one end of it being held in the hand, and the other, by means of the chain, being allowed to swing

* The maund is 82 lbs.

Gordon E-6, 9 (no date) 1907 AR? Khasi AR?

custom of their own from cultivating the *lendu*, in which case they plant certain other trees favourable to the growth of the lac insect. The villages situated near their patches of cultivation in the forest. The villages are constantly shifting, owing to the necessity of burning fresh tracts of forest every two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the houses are raised some 5 or 6 ft. from the ground on platforms, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading chillies and other articles to dry. Some Lyngam houses have only one room in which men, women, and children are all huddled together, the hearth being in the centre, and underneath the platform, the pigs. Well-to-do people, however, possess a sitting room, where husband and wife sleep. A house I measured at Nongkhlaw village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a Garo custom. In some Lyngam villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the village festivities go on. These are similar to the *dekachang* or bachelors' club-houses of the Mikirs, Garos, and Lalungs, and to the *morung* of the Nagas. This is a custom of the Thibet-Burman tribes in Assam, and is not a Khasi institution. There are also high platforms, some 12 ft. or 15 ft. in height, in Lyngam villages, where the elders sit of an evening in the hot weather and take the air. Lyngam houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lyngams keep pigs, they do not seem to be so much *en évidence* as in the Khasi village. There is little or no furniture in a Lyngam house. The Lyngam sleeps on a mat on the floor, and in cold weather covers himself with a

[of the Lyngams ... (no ly.)]

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

quilt, made out of the bark of a tree, which is beaten 352
out and then carefully woven, several layers of flattened 513
bark being used before the right thickness is attained. 287
This quilt is called by the Lyngams "*Ka syllar*" (Garo *simpak*).
Food is cooked in earthen pots, but no plates are used, the broad 252
leaves of the *mariang* tree taking their place. The leaves are 415
thrown away after use, a fresh supply being required for each meal.

The Lyngams brew rice beer, they do not distil spirit; the 279
beer is brewed according to the Khasi method. Games they have 526
none, and there are no jovial archery meetings like those of the Khasis. The Lyngam methods of hunting are setting spring 221
guns and digging pitfalls for game. The people say that now the Government and the Siem of Nongstoin have prohibited both of these methods of destroying game, they no longer employ them. But I came across a pitfall for deer not long ago in the neighbourhood of a village in the Lyngam country. The people declared it to be a very old one; but this I very much doubt, and I fear that these objectionable methods of hunting are still used. The Lyngams fish to a 226
small extent with nets, but their idea of fishing, *par excellence*, is poisoning the streams, an account of which has already been given in this monograph. The Lyngams are omnivorous 262
feeders, they may be said to eat everything except dogs, snakes, the *bulok* monkey, and lizards. They like rice, when they can get it; for sometimes the out-turn of their fields does not last them more than a few months. They then have to fall back on Job's-tears and millet. They eat arums largely, and for vegetables they cook wild plantains and the young shoots of bamboos and cane plants. The Lyngams are divided up into 614
exogamous clans in the same manner as the Khasis. The clans 773
are overgrown families. The Lyngams have some stories regarding the founders of these clans, of which the following is a specimen:—"A woman was asleep under a *sohbar* tree in the jungle, a flower from which fell on her, and she conceived and bore a female child who was the ancestress of the Nongsohbar clan." Some of the stories of the origins of other clans do not bear repeating. There do not appear to be any 582
hypergamous groups. As with the Khasis, it is a deadly sin to 614

342 But in some huts there are no such partitions and the demarcation is made by the pillars and beams which support the roof of the hut. The small enclosures at the two sides in the front portion are known locally as Ka Kynrein. The Ka Kynrein at the right hand side of the Ka Nympei close to the Ka Kyndur generally is used for storing water. The Ka Kynrein at the left hand side of the Ka Nympei just opposite to that for storing water is used as a larder for potatoes and other provisions. The enclosures at the rear of the Ka Nympei and those remaining at its sides are used as sleeping places. The sleeping places at the sides are known as Ka Iing Kyndong and those at the rear
342 as Ka Rumpei. In most huts there is a window in the Ka
354 Rumpei, high up in the back wall of the hut. In some huts there is a window in the front wall, in the Ka Kyndur. In many huts there is no window at all. Besides the main door in the Ka Kyndur, there is another door to the Ka Kynrein at the right hand side of the Ka Nympei. We were informed that in Cherra the part called Ka Kyndur is termed Ka Shyngkup, and Ka Kynrein as Ka Pyngkai.

In the centre of the Ka Nympei there is the hearth known as Ka Dypei. It is a rectangular space, about four feet and a half in length and three feet and a half in breadth, enclosed by fenders of wood. The floor of the hearth is paved with stone and mud. In the centre of it there are three small-shaped stone
352 pieces which are known as Mawbyrsiew. On the Mawbyrsiew there is an iron triangle known as Ka Nar to hold the pots. The space of the Ka Nympei behind the hearth and in front of the Ka Rumpei is known as Jingbuhkhiewja.

Running round the edge of the Ka Nympei at a man's height there is a wooden frame supported on vertical posts; to this frame are fixed the partitions, separating the Ka Nympei from the Ka Kyndur, Ka Kynrein, Ka Iing Kyndong and Ka Rumpei. This wooden frame is known as Bahtymphan or Bahtympha. Just above the Bahtymphan several stout beams of wood cross the house from side to side and rest on the

● 352 Babtymphan. They are known as Ukhung. The Ukhung above the Dypei are placed close to one another. A little apart from this row of Ukhungs, there is a single Ukhung parallel to the others which in some huts is hollowed out and is used as a receptacle for some household articles.

342 The frame of the roof as observed from inside consists of a central ridge pole running along the length of the hut and situated above the middle of it. From the ridge pole pairs of rafters diverge on two sides, their lower ends resting on the side walls of the hut. In front of the hut, the rafters are radially spread out from the anterior end of the ridge pole which is supported by a vertical pole known as Rijit. These rafters rest on semi-circular wall at the bend of the 'U'. The ridge pole and the rafters are known as Kynshi. Besides the rafters there are thinner wooden poles similarly arranged which further strengthen the frame of the roof. They are known as Ubnoh. The small rafters which are set cross-wise on the sloping Kynshi and form each series a 'U' round the ceilling are known as U Pyniar. This frame for the roof is made on those huts where thatching grass is used, that is, in the old type of huts. In modern huts where corrugated or flat sheets of iron have been used instead of thatching grass such a frame is not required.

In the village of Mawphlang, we saw an old type hut, of Ka Lita repaired and re-built. At first the raised rectangular portion of the hut, the Ka Nympei, was reconstructed on a raised platform, with the frame for the roof above it. Then a semi-circular area was taken in front of the Ka Nympei about one-third the area of the inner compartment. Simultaneously with the making of the frame of the Ka Kyndur, the thatch was made in sections in bamboo frames. Then the roof of the hut was covered with these sections which were arranged in overlapping sheets (see plate). An old type Khasi hut is about thirty feet long; it is about twenty feet wide at the back.

343 Reference has been made to the usual pigsty adjoining each house. It is generally a small thatched shed with walls made of

16: McCormack E-4,5 (1956-1958) 1964
[P. 107 B] AR7 Khasi AR7

pendable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and tree groves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway, this is no longer the case, and paths feed into villages from all directions. Often several villages are nucleated into one large unit, named and also described as a "village." These were once defense units, but were so uncohesive otherwise that institutionalized rivalry obtained among the component villages. Now, they have been integrated through the agency of all-village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a U-shaped ground plan, and is about 20 feet at widest extent, it is about 30 feet deep, and is elliptical or hogback in profile. Its walls are of stone blocks cemented with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on their outside, down to about three feet above the ground. The house is divided into two parts: the front one-third is on the ground level, floored either with stone blocks or tamped earth, and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, areas for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is totally undecorated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for fuel storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Western-style bungalows of wood and tin, especially in and around Shillong. [Cf. Mukherjee et al. 1941.]

ECONOMY. The Khasi economy is a market economy based on agriculture, and most Khasis are primary producers, sellers, middlemen, and/or providers of services in connection with markets. Khasis are often multioccupational: they produce goods for partial subsistence, and also play some part in trade. **Agriculture.** On the Shillong plateau, the major field crops are potatoes, maize, millets, and dry rice, still produced mostly through swidden farming, with a two- to three-year period of fallow, but increasingly through continuous use of a single field with the aid of ma-

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

428 to the sisters of his wife, or to her nearest relatives if there are no sisters. The rank and titles of a deceased male descend to his brother; when no brother exists, then to the male children of his mother's sisters (maternal aunts); should the maternal aunts have no male children living at the time, then to the eldest male child of his sisters. When no relatives are to be found, the property of the deceased goes to the ruler of the country; or if a man dies leaving no relative other than wife and children, *i.e.* no relatives on the mother's side, the property in this case also goes to the ruler, who, as the wife and children cannot preserve the ashes of the deceased, takes charge of them, and for so doing takes all the property also. With regard to the inhabitants of the Lower Hills at Shellá, the custom as to succession is as follows:—Property belonging to a subject of Shellá is divided into two classes—(1) Property inherited from ancestors, which descends to the nearest of kin or to the relative of a deceased person who can perform his obsequies. (2) Property acquired during the lifetime of the holder, which is inherited by the children, whose duty it is to provide for the maintenance of their mother until she re-marries or dies.'

434 465 MATERIAL CONDITION OF THE PEOPLE.—The Khásiás and the Syntengs are as a people prosperous. Common labourers, if adult males, can earn wages as high as one shilling per diem, and adult 342 females as high as eightpence. The dwellings of the well-to-do classes are generally constructed of masonry, with thatched roof and 352 plank floor, and divided into two or three rooms. The furniture consists of a bedstead (*charpái*), a seat or two (*morá*), some cooking 342 utensils, and a few boxes. The ordinary peasants and poorer 184 classes construct their huts of stone, mud, or plank walls, with a thatch or cane roof. These are fitted with wooden platforms 262 or loose planks placed on the ground to serve as beds. The food of the well-to-do classes consists of rice, fish when obtainable, fowl 434 or meat, curry, vegetables, oil, hog's lard, fermented and spirituous liquor. It may be estimated that the living expenses of an average-sized household of this class would be about Rs. 25 or £2, 10s. a month, valuing the articles of consumption at *bázár* prices. An ordinary husbandman or labourer lives on rice, dry fish, occasionally a 276 little meat, oil, or hog's lard. *Pán* leaf, betel-nut, and lime are essential to the comfort of all the hill people, who are inveterate chewers of *pán*. They commence at an early age, and are rarely seen without a *pán* leaf in their mouths; the females are quite

273 krem. Before I could enter a hut the occupants had to remove a man who was dead drunk. Over
352 the fireplace hangs a rack on which wood is piled up for drying; also food provisions, rice, etc. are kept dry here during the rainy season. Behind it a rack made of sturdy beams runs straight through the center and sometimes extends along the sides. On it all kinds of household items are kept. In the better houses the best dishes of shiny, polished brass and china are displayed here. This rack also serves as a partition behind which, on the sides and at the rear wall of the house, are the sleeping accommodations.
[356] Considering the very unprepossessing physical appearance of the people, it is surprising how orderly and clean the houses are kept inside.
342 In the principal towns the well-to-do have already adopted the brick building and European comfort. With the Lynngam and the Bhoi, however, we still find the pile dwelling (77). The houses

77. Gurdon, ibid., p. 32. There it is mentioned (above) that in some villages of the subdivision of the War pile dwellings are built because the main part of the house rests on firm ground on the mountain side and then extends on piles over the slope. (Cf. the Garo.) The same people still use the bachelor house.

have a length from 10 to 12 meters with a veranda which among the Lynngam is in front, among the Bhoi in the rear of the house. These people
[241] still practise migratory agriculture and therefore move their flimsily constructed houses every two or three years when they change to new fields. It follows that the Khasi house, as described above, represents an advanced construction method. That in earlier days bamboo construction was

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

776 793 or official spokesman of the Siem's Durbar. Another post of oak in this house is furnished by the people of the State.

342 177 353 The houses of the well-to-do Khasis of the present day in Mawkhar and Cherrapunji are built after the modern style with iron roofs, chimneys, glass windows and doors. In Jowai the well-to-do traders have excellent houses of the European pattern, which are as comfortable as many of the European subordinates' quarters in Shillong. Some up-to-date families in Shillong and at Cherra allow themselves muslin curtains and European furniture.

342 [824] The houses of the Pnar-Wárs are peculiar. The roof, which is thatched with the leaves of a palm called *u tynriew*, is hog-backed and the eaves come down almost to the ground. There are three rooms in the Wár as in the Khasi house, although called by different names in the Wár dialect. The hearth is in the centre room. [361] The houses are built flush with the ground and are made of bamboos. 346 In the Wár villages of Nongjri and Umniuh there are small houses erected in the compounds of 782 the ordinary dwelling-houses called *ieng ksuid* (spirit houses). In these houses offerings to the spirits of departed family ancestors are placed at intervals, this practice being very similar to the more ancient form of Shintoism. In some Wár villages 342 there are also separate bachelors' quarters. This custom is in accordance with that of the Naga tribes. There is no such custom amongst the Khasi Uplanders. The Wár houses are similar to those of the Pnar Wárs, except that a portion of the house is generally built on a platform, the main house resting on the hill-side and the portion on the platform projecting therefrom, the object being to obtain more space, the area for houses in the village sites being often limited owing to the steepness of the hill-sides.

The Bhoi and Lynngam houses are practically similar, and may be described together. They are generally built on fairly high platforms of bamboo, are frequently 30 to 40 ft. in length, and are divided into various compartments in order [354] to suit the needs of the family. The hearth, which is of earth, is in the centre room. There is a platform at the back of the Lynngam house, and in front of the Bhoi house, used for drying paddy, spreading chillies, &c., and for sitting on when the day's

pendable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and tree groves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. 231 Shillong is excellent, the flavour being quite as good as that
263 of English honey. Under "Miscellaneous Customs connected with Death" will be found a reference to the statement that the
[764] dead bodies of Siems used to be embalmed in honey. The existence of the custom is generally denied by Khasis, but its former prevalence is probable, as several trustworthy authors have quoted it.

HOUSES.

342 The houses of the people are cleaner than might be supposed
515 after taking into consideration the dirtiness of the clothes and persons of those who inhabit them. They are as a rule substantial thatched cottages with plank or stone walls, and raised on a plinth some 2 to 3 ft. from the ground. The only
354 window is a small opening on one side of the house, which admits but a dim light into the smoke-begrimed interior. The beams are so low that it is impossible for a person of ordinary stature to stand erect within. The fire is always burning on an earthen or stone hearth in the centre. There is no chimney, the smoke finding its exit as best it can. The firewood is placed to dry on a swinging frame above the hearth. In the
343 porch are stacked fuel and odds and ends. The pigs and calves
342 are generally kept in little houses just outside the main building. The Khasi house is oval-shaped, and is divided into three rooms, a porch, a centre room, and a retiring-room.

354 In olden days the Khasis considered nails *sang*, or taboo, and
784 only used a certain kind of timber for the fender which surrounds the hearth; but they are not so particular now-a-days. In Mawkhar, Cherrapunji, and other large villages, the walls of
342 houses are generally of stone. In Cherrapunji the houses are frequently large, but the largest house I have seen in the hills is that of the Doloi of Suhtnga in the Jaintia Hills, which measures 74 ft. in length. The house of the Siem Priestess at Smit in the Khasi Hills is another large one, being 61 ft. long by 30 ft. broad. In front of the Khasi house is a little space fenced in on two sides, but open towards the village street. The

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

776 793 or official spokesman of the Siem's Durbar. Another post of oak in this house is furnished by the people of the State.

342 179 353 The houses of the well-to-do Khasis of the present day in Mawkhar and Cherrapunji are built after the modern style with iron roofs, chimneys, glass windows and doors. In Jowai the well-to-do traders have excellent houses of the European pattern, which are as comfortable as many of the European subordinates' quarters in Shillong. Some up-to-date families in Shillong and at Cherra allow themselves muslin curtains and European furniture.

342 [824] The houses of the Pnar-Wárs are peculiar. The roof, which is thatched with the leaves of a palm called *u tynriew*, is hog-backed and the eaves come down almost to the ground. There are three rooms in the Wár as in the Khasi house, although called by different names in the Wár dialect. The hearth is in the centre room. [361] The houses are built flush with the ground and are made of bamboos. In the Wár villages of Nongjri and 346 Umniuh there are small houses erected in the compounds of 782 the ordinary dwelling-houses called *ieng ksuid* (spirit houses). In these houses offerings to the spirits of departed family ancestors are placed at intervals, this practice being very similar to the more ancient form of Shintoism. In some Wár villages 342 there are also separate bachelors' quarters. This custom is in accordance with that of the Naga tribes. There is no such custom amongst the Khasi Uplanders. The Wár houses are similar to those of the Pnar Wárs, except that a portion of the house is generally built on a platform, the main house resting on the hill-side and the portion on the platform projecting therefrom, the object being to obtain more space, the area for houses in the village sites being often limited owing to the steepness of the hill-sides.

The Bhoi and Lynngam houses are practically similar, and may be described together. They are generally built on fairly high platforms of bamboo, are frequently 30 to 40 ft. in length, and are divided into various compartments in order [354] to suit the needs of the family. The hearth, which is of earth, is in the centre room. There is a platform at the back of the Lynngam house, and in front of the Bhoi house, used for drying paddy, spreading chillies, &c., and for sitting on when the day's

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

241 custom of their own from cultivating the *landoo*, in which
231 case they plant certain other trees favourable to the growth of
784 the lac insect. The villages are situated near their patches of cultivation in the forest. The villages are constantly shifting,
361 owing to the necessity of burning fresh tracts of forest every
241 two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the
342 houses are raised some 3 or 4 ft. from the ground on platforms, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading chillies and
342 other articles to dry. Some Lynngam houses have only one
●354 room in which men, women, and children are all huddled together, the hearth being in the centre, and, underneath the
231 platform, the pigs. Well-to-do people, however, possess a
342 retiring room, where husband and wife sleep. A house I measured at Nongsohbar village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a Garo custom. In some Lynngam villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the
[171] village festivities go on. These are similar to the *dekachang* or bachelors' club-houses of the Mikirs, Garos, and Lalungs, and to the *morang* of the Nagas. This is a custom of the Thibeto-Burman tribes in Assam, and is not a Khasi institution. There
[517] are also high platforms, some 12 ft. or 15 ft. in height, in Lynngam villages, where the elders sit of an evening in the hot
[356] weather and take the air. Lynngam houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lynngams keep pigs, they do not seem to be so
352 much *en évidence* as in the Khasi village. There is little
513 or no furniture in a Lynngam house. The Lynngam sleeps on
287 a mat on the floor, and in cold weather covers himself with a

342 But in some huts there are no such partitions and the demarcation is made by the pillars and beams which support the roof of the hut. The small enclosures at the two sides in the front portion are known locally as Ka Kynrein. The Ka Kynrein at the right hand side of the Ka Nympei close to the Ka Kyndur generally is used for storing water. The Ka Kynrein at the left hand side of the Ka Nympei just opposite to that for storing water is used as a larder for potatoes and other provisions. The enclosures at the rear of the Ka Nympei and those remaining at its sides are used as sleeping places. The sleeping places at the sides are known as Ka Iing Kyndong and those at the rear
342 as Ka Rumpei. In most huts there is a window in the Ka
354 Rumpei, high up in the back wall of the hut. In some huts there is a window in the front wall, in the Ka Kyndur. In many huts there is no window at all. Besides the main door in the Ka Kyndur, there is another door to the Ka Kynrein at the right hand side of the Ka Nympei. We were informed that in Cherra the part called Ka Kyndur is termed Ka Shyngkup, and Ka Kynrein as Ka Pyngshai.

In the centre of the Ka Nympei there is the hearth known as Ka Dypei. It is a rectangular space, about four feet and a half in length and three feet and a half in breadth, enclosed by fenders of wood. The floor of the hearth is paved with stone and mud. In the centre of it there are three small-shaped stone
352 pieces which are known as Mawbyrsiew. On the Mawbyrsiew there is an iron triangle known as Ka Nar to hold the pots. The space of the Ka Nympei behind the hearth and in front of the Ka Rumpei is known as Jingbuhkhiewja.

Running round the edge of the Ka Nympei at a man's height there is a wooden frame supported on vertical posts; to this frame are fixed the partitions, separating the Ka Nympei from the Ka Kyndur, Ka Kynrein, Ka Iing Kyndong and Ka Rumpei. This wooden frame is known as Bahtymphan or Bahtympha. Just above the Bahtymphan several stout beams of wood cross the house from side to side and rest on the

pendable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and tree groves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway; this is no longer the case, and paths feed into villages from all directions. Often several villages are nucleated into one large unit, named and also described as a "village." These were once defense units, but were so uncohesive otherwise that institutionalized rivalry obtained among the component villages. Now, they have been integrated through the agency of all-village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a U-shaped ground plan, and is about 20 feet at widest extent; it is about 30 feet deep, and is elliptical or hogback in profile. Its walls are of stone blocks cemented with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on their outside, down to about three feet above the ground. The house is divided into two parts: the front one-third is on the ground level, floored either with stone blocks or tamped earth, and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, areas for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is totally undecorated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for fuel storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Western-style bungalows of wood and tin, especially in and around Shillong. [Cf. Mukherjee et al. 1941.]

361 [944] [443] 778 [344] [178] [712] [628] [178] [182] 342 352 353 354 343 351 177 184 342

ECONOMY. The Khasi economy is a market economy based on agriculture, and most Khasis are primary producers, sellers, middlemen, and/or providers of services in connection with markets. Khasis are often multioccupational: they produce goods for partial subsistence, and also play some part in trade. **Agriculture.** On the Shillong plateau, the major field crops are potatoes, maize, millets, and dry rice, still produced mostly through swidden farming, with a two- to three-year period of fallow, but increasingly through continuous use of a single field with the aid of ma-

241 433 443 [463] 241

342 down /233/ toward the front in a broad curve, projects here quite a bit beyond the front of the house and covers the stone terrace before the entrance, which is supported by posts, where the occupants customarily sit during the daytime. Firewood is also piled up here at the sides. In the rear the roof ridge is very little--or not at all--curved; the general impression which the house makes through its roof form has been compared with a pig which stands with bowed head before the fodder trough. Generally speaking, the Khasi houses are not very large. I did not see any houses longer than from 6 to 9 meters and with a width of from 3 to 5 meters. However, according to Gurdon (p. 30) there are sometimes houses with a length of more than 20 meters. The interior is completely dark. Sometimes a small window at the side--an innovation--or a second side entrance allows some light to filter in. From the roofed terrace one enters first an anteroom which contains at both sides provisions, potatoes, and also wood. A board wall which is closed on top by a wooden grate, where light and air can pass through, separates this anteroom from the main room; upon entering one has to walk up a few steps or climb over a high threshold. [354] In the middle, toward the rear, is the fireplace. If the owner has a distilling license from the 273 British authorities (76) the distilling vessels

76. The restriction through license to counteract a little the consumption of alcohol, exists only in the area of Shillong. Otherwise the brandy production by the Khasi is not regulated.

for the preparation of rice or millet brandy are always kept here. The people have a strong preference for alcohol and especially on bazaar days it is no rarity to see tipsy people. I observed this particularly at the bazaar in Nong-

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

241 custom of their own from cultivating the *landoo*, in which
231 case they plant certain other trees favourable to the growth of
784 the lac insect. The villages are situated near their patches of cultivation in the forest. The villages are constantly shifting,
361 owing to the necessity of burning fresh tracts of forest every
241 two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the
342 houses are raised some 3 or 4 ft. from the ground on platforms, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading chillies and
342 other articles to dry. Some Lynngam houses have only one
354 room in which men, women, and children are all huddled together, the hearth being in the centre, and, underneath the
231 platform, the pigs. Well-to-do people, however, possess a retiring room, where husband and wife sleep. A house I
342 measured at Nongsohbar village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a Garo custom. In some Lynngam villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the
[171] village festivities go on. These are similar to the *dekachang* or bachelors' club-houses of the Mikirs, Garos, and Lalungs, and to the *morang* of the Nagas. This is a custom of the Thibeto-Burman tribes in Assam, and is not a Khasi institution. There
[517] are also high platforms, some 12 ft. or 15 ft. in height, in Lynngam villages, where the elders sit of an evening in the hot
• [356] weather and take the air. Lynngam houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lynngams keep pigs, they do not seem to be so
352 much *en évidence* as in the Khasi village. There is little
513 or no furniture in a Lynngam house. The Lynngam sleeps on
287 a mat on the floor, and in cold weather covers himself with a

273 krem. Before I could enter a hut the occupants
had to remove a man who was dead drunk. Over
352 the fireplace hangs a rack on which wood is piled
up for drying; also food provisions, rice, etc.
are kept dry here during the rainy season. Be-
hind it a rack made of sturdy beams runs straight
through the center and sometimes extends along
the sides. On it all kinds of household items
are kept. In the better houses the best dishes
of shiny, polished brass and china are displayed
here. This rack also serves as a partition be-
hind which, on the sides and at the rear wall of
the house, are the sleeping accommodations.
[356] Considering the very unprepossessing physical
appearance of the people, it is surprising how
orderly and clean the houses are kept inside.
342 In the principal towns the well-to-do have al-
ready adopted the brick building and European
comfort. With the Lynngam and the Bhoi, however,
we still find the pile dwelling (77). The houses

77. Gurdon, ibid., p. 32. There
it is mentioned (above) that in
some villages of the subdivision
of the War pile dwellings are
built because the main part of the
house rests on firm ground on the
mountain side and then extends on
piles over the slope. (Cf. the
Garo.) The same people still use
the bachelor house.

have a length from 10 to 12 meters with a veranda
which among the Lynngam is in front, among the
Bhoi in the rear of the house. These people
[241] still practise migratory agriculture and there-
fore move their flimsily constructed houses every
two or three years when they change to new fields.
It follows that the Khasi house, as described
above, represents an advanced construction method.
That in earlier days bamboo construction was

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

[p. 24]

SECTION II.

OCCUPATION.

241 THE greater proportion of the population subsists by cultiva-
463 tion. Cultivation of rice may be divided under two headings,
[162] high land or dry cultivation and low land or wet cultivation. The total number of persons who subsist by agriculture generally in the hills, is given in the last Census Report as 154,907, but the term agriculture includes the cultivation of the potato, the orange, betel-nut and *pán*. A full description of the different forms of agriculture will be given under the
463 heading "Agriculture." A considerable number of Khasis earn
482 their livelihood as porters, carrying potatoes to the markets on
439 the Sylhet side of the district, from whence the crop is conveyed by means of country boats to the different places of call of river-steamers in the Surma Valley, the steamers carrying the potatoes to Calcutta. Potatoes are also largely carried to Shillong by porters, where the tuber is readily bought by Marwari merchants, who load it in carts to be conveyed by road to Gauhati, from which station it is again shipped to
492 Calcutta and Upper Assam. Many persons are also employed in
463 carrying rice up the hill from Theria to Cherrapunji, Shillong,
[466] and on to other places. Salt is also carried by porters by this route. Many Khasis, both male and female, live by daily labour in this way, earning as much as eight annas, and
[463] six annas a day, respectively. The Census Report of 1901 shows some 14,000 "general labourers" in the district, the greater number of whom are porters and coolies, both male
[357] and female, employed on road work and on building. In Shillong the Government Offices and the printing press give employment to a certain number of Khasis. There is also a fair demand for Khasi domestic servants, both among the Europeans and the Bengali and Assamese clerks who are employed at the headquarters of the Administration.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

101 131 563 district. The Lyngams inhabit the western portion of the Khasi Hills proper. A line drawn north and south through the village of Nongtoin may be said to form their eastern boundary, and the Kamrup and Sylhet districts their northern and southern boundaries, respectively. The people known as *Bhois* in these hills, who are many of them really Mikirs, live in the low hills to the north and north-east of the district, the term "Bhoi" being a territorial name rather than tribal. The eastern boundary of the Lyngam country may be said to form their north-western boundary. The Wárs inhabit the precipitous slopes and deep valleys to the south of the district. Their country extends along the entire southern boundary of the district to the Jadukata, or Kenchi-iong, river where the Lyngam territory may be said to commence towards the south. There are some Hadem colonies in the extreme eastern portions of the Jaintia Hills. It is these colonies which are sometimes referred to by other writers as "Kuki Colonies." They are settlers from the North Cachar Sub-division of the Cachar district within recent years. It is possible that the title Hadem may have some connection with *Hidimba*, the ancient name for the North Cachar Hills.

APPEARANCE.

142 The colour of the Khasi skin may be described as being usually brown, varying from dark to a light yellowish brown, according to locality. The complexion of the people who inhabit the uplands is of a somewhat lighter shade, and many of the women, especially those who live at Nongkrem, Laitlyngkot, Mawphlang, and other villages of the surrounding high plateaux, possess that pretty gipsy complexion that is seen in the South of Europe amongst the peasants. The people of Cherrapunji village are specially fair. The Syntengs of the Jaintia Hills are darker than the Khasi uplanders. The Wárs who live in the low valleys are frequently more swarthy than the Khasis. The Bhois have the flabby-looking yellow skin of the Mikirs, and the Lyngams are darker than the Khasis. The Lyngams are probably the darkest complexioned people in the

Garo Hills	117	162
Manipur	69	101
Total	4,091*	

The following information regarding the general aspect of [127] the Khasi and Jaintia Hills district, with some additions, is 133 derived from Sir William Hunter's Statistical Account of Assam. The district consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is very steep until a table-land is met with at an elevation of about 4,000 feet at Cherrapunji. Higher up there is another plateau at Mawphlang. This is the [361] highest portion of the hills, some villages being found at as high an elevation as close on 6,000 feet above sea level. Fifteen miles to the east of Mawphlang, and in the same range, is situated the civil station of Shillong, at an average elevation of about 4,900 feet. The elevation of the Shillong Peak, the highest hill in the district, is 6,450 feet above sea level. On the northern side of the hills are two plateaux, one between 1,000 and 2,000 feet below the level of Shillong, and another at an elevation of about 2,000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where 137 the hills have been denuded of forest, the country is covered 185 with short grass, which becomes longer and more rank in the 374 lower elevations. This denudation of forest has been largely 327 due to the wood being used by the Khasis for fuel for iron smelting in days gone by. The Government, however, has taken steps to protect the remaining forests from further 137 spoliation. A remarkable feature is the presence of numerous [778] sacred groves situated generally just below the brows of the hills. In these woods are to be found principally oak and rhododendron trees. The fir-tree (Pinus Khasia) is first met with on the road from Gauhati to Shillong, at Umsning, at an elevation of about 2,500 feet. In the neighbourhood of Shillong the fir grows profusely, but the finest fir-trees are to be seen

* The figures for Khasi population in the Khasi and Jaintia Hills district will be found under "Habitat."

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

limestone caves and underground water-courses on the southern face of the hills. This series contains coal-beds, e.g. the Cherra-field and that at Lakadong in the Jaintia Hills. Some description of the remarkable Kyllang Rock may not be out of place. Sir Joseph Hooker describes it as a dome of red granite, 5,400 feet above sea level, accessible from the north and east, but almost perpendicular to the southward where the slope is 80° for 600 feet. The elevation is said by Hooker to be 400 feet above the mean level of the surrounding ridges and 700 feet above the bottom of the valleys. The south or steepest side is encumbered with enormous detached blocks, while the north is clothed with forests containing red tree-rhododendrons and oaks. Hooker says that on its skirts grows a "white bushy rhododendron" which he found nowhere else. There is, however, a specimen of it now in the Shillong Lake garden. Numerous orchids are to be found in the Kyllang wood, notably a beautiful white one, called by the Khasis *u'tiw kyllang synrai*, which blooms in the autumn. The view from the top of the rock is very extensive, especially towards the north, where a magnificent panorama of the Himalayas is obtained in the autumn. The most remarkable phenomenon of any kind in the country is undoubtedly the enormous quantity of rain which falls at Cherrapunji.* Practically the whole of the rainfall occurs in the rains, i.e. from May to October. The remainder of the district is less rainy. The climate of the central plateau of the Shillong range is very salubrious, but the low hills in parts of the district are malarious. The effect of the different climates can at once be seen by examining the physique of the inhabitants. The Khasis who live in the high central plateaux are exceptionally healthy and strong, but those who live in the unhealthy "Bhoi country" to the north, and in the Lynngam portion to the west of the district, are often stunted and sickly. Not so, however, the Wárs who live on the southern slopes, for although their country is very hot at certain times of the year, it does not appear to be abnormally unhealthy except in certain

* The average rainfall at the Cherrapunji Police Station during the last twenty years, from figures obtained from the office of the Director of Land Records and Agriculture, has been 448 inches. The greatest rainfall registered in any one year during the period was in 1899, when it amounted to 641 inches.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

147 villages, such as Shella, Borpunji, Umniuh, and in Narpuh in
132 the Jaintia Hills.
361

ORIGIN.

173 The origin of the Khasis is a very vexed question. Although it is probable that the Khasis have inhabited their present abode for at any rate a considerable period, there seems to be a fairly general belief amongst them that they originally came from elsewhere. The Rev. H. Roberts, in the introduction to his Khasi Grammar, states that "tradition, such as it is, connects them politically with the Burmese, to whose king they were up to a comparatively recent date rendering homage, by sending him an annual tribute in the shape of an axe, as an emblem merely of submission." Another tradition points out the north as the direction from which they migrated, and Sylhet as the terminus of their wanderings, from which they were ultimately driven back into their present hill fastnesses by a great flood, after a more or less peaceful occupation of that district. It was on the occasion of this great flood, the legend runs, that the Khasi lost the art of writing, the Khasi losing his book whilst he was swimming at the time of this flood, whereas the Bengali
[212] managed to preserve his. Owing to the Khasis having possessed no written character before the advent of the Welsh missionaries, there are no histories as is the case with the Ahoms of the Assam Valley, and therefore no record of their journeys.
114 Mr. Shadwell, the oldest living authority we have on the
173 Khasis, and one who has been in close touch with the people for more than half a century, mentions a tradition amongst them that they originally came into Assam from Burma *viâ* the Patkoi range, having followed the route of one of the Burmese invasions. Mr. Shadwell has heard them mention the name Patkoi as a hill they met with on their journey. All this sort of
144 thing is, however, inexpressibly vague. In the chapter dealing
173 with "Affinities" have been given some reasons for supposing that the Khasis and other tribes of the Mon-Anam family, originally occupied a large portion of the Indian continent. Where the actual cradle of the Mon-Anam race was, is as

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

776 793 or official spokesman of the Siem's Durbar. Another post of oak in this house is furnished by the people of the State.

342 177 353 The houses of the well-to-do Khasis of the present day in Mawkhar and Cherrapunji are built after the modern style with iron roofs, chimneys, glass windows and doors. In Jowai the well-to-do traders have excellent houses of the European pattern, which are as comfortable as many of the European subordinates' quarters in Shillong. Some up-to-date families in Shillong and at Cherra allow themselves muslin curtains and European furniture.

342 [824] The houses of the Pnar-Wárs are peculiar. The roof, which is thatched with the leaves of a palm called *u tynriew*, is hog-backed and the eaves come down almost to the ground. There are three rooms in the Wár as in the Khasi house, although called by different names in the Wár dialect. The hearth is in the centre room. [361] The houses are built flush with the ground and are made of bamboos. In the Wár villages of Nongjri and 346 Umniuh there are small houses erected in the compounds of 782 the ordinary dwelling-houses called *ieng ksuid* (spirit houses). In these houses offerings to the spirits of departed family ancestors are placed at intervals, this practice being very similar to the more ancient form of Shintoism. In some Wár villages 342 there are also separate bachelors' quarters. This custom is in accordance with that of the Naga tribes. There is no such custom amongst the Khasi Uplanders. The Wár houses are similar to those of the Pnar Wárs, except that a portion of the house is generally built on a platform, the main house resting on the hill-side and the portion on the platform projecting therefrom, the object being to obtain more space, the area for houses in the village sites being often limited owing to the steepness of the hill-sides.

The Bhoi and Lynngam houses are practically similar, and may be described together. They are generally built on fairly high platforms of bamboo, are frequently 30 to 40 ft. in length, and are divided into various compartments in order [354] to suit the needs of the family. The hearth, which is of earth, is in the centre room. There is a platform at the back of the Lynngam house, and in front of the Bhoi house, used for drying paddy, spreading chillies, &c., and for sitting on when the day's

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

work is done. In order to ascend to a Bhoi house, you have to climb up a notched pole. The Bhois sacrifice a he-goat and a fowl to *Rèk-ànglong* (Khasi, *Ramiew iing*), the household god, when they build a new house.

VILLAGES.

Unlike the Nagas and Kukis, the Khasis do not build their villages on the extreme summits of hills, but a little below the tops, generally in small depressions, in order to obtain some protection from the strong winds and storms which prevail in these hills at certain times of the year. According to the late U Jeebon Roy, it is *sang*, or taboo, to the Khasis to build a house on the last eminence of a range of hills, this custom having perhaps arisen owing to the necessity of locating villages with reference to their defence against an enemy. Khasis build their houses fairly close together, but not as close as houses in the Bhoi and Lynngam villages. Khasis seldom change the sites of their villages, to which they are very much attached, where, as a rule, the family tombs are standing and the *mawbynna* or memorial stones. In many villages stone cromlechs and memorial stones are to be seen which from their appearance show that the villages have been there for many generations. During the Jaintia rebellion the village of Jowai was almost entirely destroyed, but as soon as the rebellion was over the people returned to the old site and rebuilt their village. Similarly, after the earthquake, the ancient village sites were not abandoned in many cases, but the people rebuilt their houses in their former positions, although in Shillong and Cherrapunji they rebuilt the walls of the houses of wooden materials instead of stone. There is no such thing as a specially reserved area in the village for the Siem and the nobility, all the people, rich or poor, living together in one village, their houses being scattered about indiscriminately. To the democratic Khasi the idea of the Siem living apart from his people would be repugnant. In the vicinity of the Khasi village, often just below the brow of the hill to the leeward side, are to be seen dark woods of oak

1;Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

137 and other trees. These are the sacred groves. Here the
778 villagers worship *U ryngkew U basa*, the tutelary deity of the village. These groves are taboo, and it is an offence to cut
[776] trees therein for any purpose other than for performing funeral
361 obsequies. The groves are generally not more than a few hundred yards away from the villages. The villages of the
137 Syntengs are similar in character to those of the Khasis. The
245 Wár villages nestle on the hill-sides of the southern border, and are to be seen peeping out from the green foliage with which the southern slopes are clad. In the vicinity of, and actually up to the houses, in the Wár villages, are to be observed large groves of areca-nut, often twined with the *pan* creeper, and of plantain trees, which much enhance the beauty of the scene. Looking at a Wár village from a distance, a darker shade of green is seen; this denotes the limits of the extensive groves where the justly celebrated Khasi orange is grown, which is the
361 source of so much profit to these people. The houses in the Wár villages are generally closer together than those of the Khasis, probably owing to space being limited, and to the villages being located on the slopes of hills. Generally up the
[363] narrow village streets and from house to house, there are rough steep stone steps, the upper portion of a village being frequently situated at as high an elevation as 200 to 300 ft. above the lower. In a convenient spot in a Wár village a clear space is to be seen neatly swept and kept free from weeds, and surrounded with a stone wall, where the village tribunals sit, and the elders meet in solemn conclave. Dances also are held here
778 on festive occasions. At Nongjri village there is a fine rubber
796 tree, under whose hollow trunk there are certain sacred stones where the priest performs the village ceremonies.

361 The Bhoi and Lynngam villages are built in small clearings in the forest, the houses are close together and are built often
[363] in parallel lines, a fairly broad space being reserved between
[351] the lines of houses to serve as a street. One misses the pretty gardens of the Wár villages, for Bhois and Lynngams attempt nothing of the sort, probably because, unlike the Khasi, a Bhoi or Lynngam village never remains more than two or three years in one spot; generally the villages of these people are in the vicinity of the forest clearings, sometimes actually in the midst

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

of them, more especially when the latter are situated in places where jungle is dense, and there is fear of attacks from wild animals. In the Lynngam village is to be seen a high bamboo platform some 20 to 30 ft. from the ground, built in the midst of the village, where the elders sit and gossip in the evening. 361

All the villages, Khasi, Wár, Lynngam and Bhoi, swarm with pigs, which run about the villages unchecked. The pigs feed on all kinds of filth, and in addition are fed upon the wort and spent wash of the brewings of country spirit, or rice beer, the latter being carefully collected and poured into wooden troughs. The pigs are of the usual black description seen in India. They thrive greatly in the Khasi villages, and frequently attain extreme obesity. 361 231 274

In the Khasi villages of the high plateaux are often nowadays potato gardens, the latter being carefully protected from the inroads of pigs, calves, and goats by dry dikes surmounted by hedges. 24 417

I noticed an interesting custom at a Bhoi village in Nongpoh of barricading the path leading to the village from the forest with bamboo palisading and bamboo *chevaux de frise* to keep out the demon of cholera. In the middle of the barricade there was a wooden door over which was nailed the skull of a monkey which had been sacrificed to this demon, which is, as amongst the Syntengs, called *khlam*. 751 776 782

FURNITURE AND HOUSEHOLD UTENSILS.

As in the case of houses, so with reference to furniture, the influence of civilization shows many changes. The Khasi of the present day who lives in Mawkhar * has a comfortable house regularly divided up into rooms in the European style with even some European articles of furniture, but owing probably to the influence of the women, he still possesses several of the articles of furniture which are to be met with in the houses of those who still observe the old style of living. Let us take the furniture of the kitchen to begin with. Above the hearth is slung by ropes of cane a swinging wooden framework 352 352 417

* Mawkhar is a suburb of Shillong, the headquarters station.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

played with a little wooden key held in the hand. *Ka maryngod* is an instrument much the same as the last, but is played with a bow like a violin. *Ka marynthing* is a kind of guitar with one string, played with the finger. 534

Ka tángmuri is a wooden pipe, which is played like a flageolet. *Ka kynsháw*, or *shákuriaw*, are cymbals made of bell metal; *ka sháráti*, or *ka shingwiang*, is a kind of flute made of bamboo. This instrument is played at cremation ceremonies, and when the bones and ashes of a clan are collected and placed in the family tomb, or *máwbah*. This flute is not played on ordinary occasions. In the folk-lore portion of the Monograph will be found a tale regarding it. There are other kinds of flutes which are played on ordinary occasions. The Wárs of the twenty-five villages in the Khyrim State make a sort of harp out of reed, which is called *ka 'sing ding phong*. The Khasis also play a Jews' harp (*ka mieng*), which is made of bamboo. [764] [361]

AGRICULTURE.

The Khasis are industrious cultivators, although they are behindhand in some of their methods of cultivation, (e.g. their failure to adopt the use of the plough in the greater portion of the district); they are thoroughly aware of the uses of manures. Their system of turning the sods, allowing them to dry, then burning them, and raking the ashes over the soil, is much in advance of any system of natural manuring to be seen elsewhere in the Province. The Khasis use the following agricultural implements:—A large hoe (*mokhíw heh*), an axe for felling trees (*u sdie*), a large da for felling trees (*ka wait lynngam*), two kinds of bill-hooks (*ka wáit prat* and *ka wáit khmut*), a sickle (*ka ráshi*), a plough in parts of the Jaintia Hills (*ka lyngkor*), also a harrow (*ka iuh moi*). In dealing with agriculture, the lands of the Khasi and Jaintia Hills may be divided into the following classes:—(*a*) Forest land, (*b*) wet paddy land called *háli* or *pynthor*, (*c*) high grass land or *ka ri lúm* or *ka ri phlang*, (*d*) homestead land (*ka 'dew kypér*). Forest lands are cleared by the process known as *jhuming*, the trees being felled early in the winter and allowed to lie till January or February, 241 412 241

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

wonderful mass of granite known by the name of the Kyllang 773
Rock will be found in the section of the monograph which 133
deals with geographical distribution. I have also added a
photograph of the rock. The Syntengs have a story that
when the strong west wind blows in the spring this is due to [823]
the advent of *U Kyllang*, who comes to visit his wife, the river
Umngot, at that season: amongst the Khasis hills are all of
them masculine, but to rivers is usually attributed the feminine [193]
gender. U Symper is another isolated rocky eminence rising
from the Maharam plain close to the village of K'mawan. The
best view of the hill is obtainable from Laitmawsiang on the
path to Mawsynram. The village of Mawsmai every traveller [361]
from Therria to Cherrapunji knows. It is chiefly remarkable for [211]
a fairly large limestone cave, and its fine memorial stones. The
Khasi theory to explain how the moon got its spots is, I believe,
original, but is no more extraordinary than our own nursery
tale about the "man in the moon." The *Sohpet Byneng* hill
is the first hill of any size that the traveller sees on the Gauhati
road when journeying to Shillong. It is close to Umsning Dak [36]
Bungalow. There are caves in the hill which are tenanted by
bears. Strange to say, according to Khasi ideas, this is one of the
highest points in the hills; in reality *Sophet Byneng* is some
2,000 ft. lower than the Shillong Peak. As mentioned elsewhere, 231
the Khasis are very fond of dogs; so I have given their version of 773
how the dog came to live with man. The well-known *thlen*
superstition will be found fully described under the heading of
"Human sacrifices." I have, however, thought the tale of suffi-
cient interest to reproduce at length here. The story of the river 773
Rupatylli is a pretty tale, and is just such a one as would 782
appeal to the imagination of mountaineers like the Khasis. 211
The Kopili story is important, in that it indicates the origin of 133
human sacrifices in the Jaintia Hills; it also throws, perhaps,
some light on the question of the use to which the flat table me-
morial stones were put in years gone by. The superstition about
the crossing of the Kopili can be vouched for by many who
have taken the journey from the Jaintia Hills to North Cachar
by the Kopili route. Mawpunkyrtiang is a small village close [361]
to Cherrapunji. The weird tale about the Siem of Malyniang 773
is the pride of the Maskut people, for in olden days their King,

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

805
443

Khasi Hills.	Jaintia Hills.
1. Lynkah (Barpani or Khawang)	Kyllao. (Suhtnga).
2. Nongkrem	Pynsing.
3. Um-long (Maolong the hat at Laban)	Maolong. (Nartiang).
4. Ranghep (Jeu-bah at Cherra) (Mawtawar in Mylliem) (Unsaw in Nongkhlaw)	Maosiang. (Jowai).
5. Shillong (Laitlyngkot)	Maoshai. (Shangpung).
6. Pomtih or Pomtiah (Mawkhar, small market)	Pynkat. (Mynso).
7. Umnih	Thym-blein.
8. Yeo-duh (Mawkhar, large market)	Ka-hat. (Jaintiapur).

In the Wár country, markets are usually held every fourth day, e.g. at Nongjri, Mawbang, Tyllap, and Shella. At Theria the market is held every Friday, and at Hat-majai, or Bholagunj, every Tuesday.

THE LYNNGAMS.

101 Although mention has been made incidentally in various
131 parts of this monograph of Lynngam customs, it has been thought necessary to give the Lynngams a separate chapter, as these people differ so very greatly from the Khasis in their manner of life, and in their customs. *Lynngam* is the Khasi name: the Garo name for the Lynngams is *Megam*. There
[341] are several *Megam* villages in the north-eastern corner of the Garo Hills district, and there is regular communication kept up between these villages and the Lynngam inhabitants of the Khasi Hills district. The Lynngams must not be confused with the *Hánú* or *Námdaniya* Garos who inhabit the low hills to the north of the Khasi Hills district, and are called by the
101 Khasis *Dko*. All Lynngams claim to be Khasis, they dislike
197 being called Garos; but although it is true they speak what may be called a dialect of Khasi, and observe some of the Khasi customs, the Lynngams are more Garo than Khasi. Before
101 proceeding further, it should be stated that the Assamese of Boko call the Lynngams *Núniyá* Garos, all hill people being Gares to the Assamese of that region, without distinction

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

or difference. It is owing to these three different names being 101
used for the same people that there has been so much confusion about Lynngams previously; e.g. at one census they were named *Lynngam*, at another they received the appellation of Garo, and at a third enumeration they were called Khasis. In Section I. 131
the habitat of the Lynngams has been roughly defined. It is 361
impossible to define the Lynngam country exactly, because 173
these people are continually shifting their village sites owing to the exigencies of *jhum* cultivation, which has been described in Section II. Some of the Lynngams preserve a tradition that they originally came from the Kamrup plains. It is interesting that a people, like the Garos in so many respects, should have the same idea as the Garos as to the hills on the south bank of the Brahmaputra not always having been their abode. The Garo legend is that they dwelt for 173
some years in the Goalpara and Kamrup plains after they 361
descended from Thibet, and before they moved to the Garo 144
Hills; and there is unmistakable evidence of their occupation of both districts in the shape of certain Garo villages on both banks of the Brahmaputra for some little distance up the river. If, as I suspect, the Lynngams are an offshoot of the Garos, it is, perhaps, possible that they entered the Khasi Hills much in the same way as the Garos entered the hill district to which they have given their name. The Lynngams are much darker 142
than the Khasis, and possess the Thibeto-Burman type of 177
feature often to a marked degree. It is not extraordinary that they should have adopted some of the Khasi customs, for the Khasis, being the stronger people, would in course of time be bound to influence them in this respect. That the Lynngams 611
observe the matriarchate and erect (some clans) memorial 211
stones is not peculiar, because the Garos, like the Khasis, are 764
also a matriarchal people (to a limited degree), and the custom of erecting memorial stones is not confined to the Khasis, for other hill tribes in Assam observe the practice, e.g. certain Naga tribes and the Mikirs; and the Garos themselves put up carved posts, called *kima*, in honour of the departed. Although 582
there is not much intermarriage between the Khasis and the 101
Lynngams nowadays, perhaps in days gone by there was a 144
mixture of blood, the result being the hybrid race we are now
consider

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

241 custom of their own from cultivating the *landoo*, in which
231 case they plant certain other trees favourable to the growth of
784 the lac insect. The villages are situated near their patches of cultivation in the forest. The villages are constantly shifting,
361 owing to the necessity of burning fresh tracts of forest every
241 two years. The houses are entirely built of bamboo, and, for such temporary structures, are very well built. In front, the
342 houses are raised some 3 or 4 ft. from the ground on platforms, being generally built on the side of a fairly steep hill, one end of the house resting on the ground, and the other on bamboo posts. The back end of the house is sometimes some 8 or 9 ft. from the ground. At the end of the house farthest away from the village path is a platform used for sitting out in the evening, and for spreading chillies and
342 other articles to dry. Some Lynngam houses have only one
354 room in which men, women, and children are all huddled
231 together, the hearth being in the centre, and, underneath the platform, the pigs. Well-to-do people, however, possess a
342 retiring room, where husband and wife sleep. A house I measured at Nongsohlar village was of the following dimensions:—Length, 42 ft.; breadth, 16 ft.; height of house from the ground to the eaves, front, 9 ft.; back 18 ft. Houses are built with a portion of the thatch hanging over the eaves in front. No explanation could be given me for this. It is probably a Garo custom. In some Lynngam villages there are houses in the centre of the village where the young unmarried men sleep, where male guests are accommodated, and where the
[171] village festivities go on. These are similar to the *dekachang* or bachelors' club-houses of the Mikirs, Garos, and Lalungs, and to the *morang* of the Nagas. This is a custom of the Thibeto-Burman tribes in Assam, and is not a Khasi institution. There
[577] are also high platforms, some 12 ft. or 15 ft. in height, in Lynngam villages, where the elders sit of an evening in the hot
[356] weather and take the air. Lynngam houses and villages are usually much cleaner than the ordinary Khasi villages, and although the Lynngams keep pigs, they do not seem to be so
352 much *en évidence* as in the Khasi village. There is little
513 or no furniture in a Lynngam house. The Lynngam sleeps on
287 a mat on the floor, and in cold weather covers himself with a

[40a] The Village Raliang

482 laden themselves with more than 80 to 85 pounds.

484 Many Khasi have to start during the afternoon because of the great distance to the market. They spend the night with acquaintances. In the dark [706] they march by torch light. The torches consist of several igra, i.e., very thin bamboo tube[4], saturated with petroleum and lighted. Or a large bamboo tube is filled with cloth that has been saturated in petroleum. The burning torches are swung in circles while the Khasi march so that only a glow is provided, but this prevents the torches from going out. The glow is quite sufficient for giving enough light for the road (foot path).

[276] Betel nuts are chewed (4) all the way and

4. The length of the road is also measured in "betel nuts."

water pipes are smoked during the rests.

443 b) The Market Place. It is not possible
●361 to talk about a definite place where the Khasi usually hold the market. This varies considerably according to the region. First of all the place chosen for the market lies outside the village. By preference they hold their markets on high ground or some such safe place. A place that has once been chosen remains the
[778] market place for that particular village. The market place is often found very close to the memorial stones, just as if the spirits of the ancestors honored there should offer aid and protection to the visitors to the market. On the southern slopes of the Khasi Mountains the market is often held on the bank of a river, for the reason that the Khasi come to these markets in boats. The market place in Mawkhlein is quite isolated. Also the one in

Laban, but there is a small wood near there. 443
The market place is also often found under 361
trees, at the edge of a forest or near the memorial stones.

c) Market Huts. Usually the market is 443
held in the open air. Grass offers places 347
to sit as well as places for laying out the wares. But in many places there are also market halls or market huts. These are simple halls, open on all sides, made with a framework of bamboo poles and a roof of straw or palm leaves. The market huts or market halls are built with square corners and have gabled roofs. They offer the women sellers protection from the sun or rain only, but no other comforts. Neither tables nor chairs nor other arrangements for displaying wares are there. On the side where the wind blows these market halls are often covered with bamboo mats.

d) Choosing the Place for Selling. 443
The choice of the place for selling is left 462
up to the seller. Yet a certain division can be recognized at every market. This division could be called a division according to sex. In the middle the food stuffs are usually sold which the women take care of. Utensils and cattle which are the business of the men, are sold at the edges. Therefore there is a definite arrangement to the market which is taken for granted by the Khasi: in the middle the women, outside the men (there is a similar order for the dance: in the middle the feminine sex, outside the masculine sex). The individual types of wares have [707] their definite places, although individual sellers are not assigned definite places.

The women settle down at any place that 443
seems good to them after their arrival at the market. They spread out in front of them the

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

291 small kilt), and a cap which is peaked in front and which comes down well over the ears, called (*ka tupia shkor*) ear cap. The dress of the Khasi females is somewhat different from that of the Synteng, the former wears a striped cloth tied round the waist, hanging down to the knees, and another cloth, with a fringed border, knotted on both the shoulders to cover the bust and a narrow cloth, called *ka jympien*, to serve the purpose of under-clothing. A cloth knotted in front is also worn like a cloak over shoulders. The Synteng woman wears a cloth smoothed round the body fastened above the bust and drooping down to the ankles. Another cloth is thrown over the shoulders, and crossed in front. Both Khasi and Synteng women wear a cloth tied over the head, called *ka tap mohkhlieh*. Up-to-date Khasi males wear knicker-
292 bockers, stockings, and boots, and females chemises. On festive occasions, both Khasis and Syntengs, males and females, wear expensive silks, with earrings of gold or silver. There is a special dancing-dress of
301 elaborate pattern: The women at festivals wear a circlet of silver with a spear-head ornament behind, rising 4 or 5 inches from the back of the head. Large coral beads are much valued, and necklaces of alternate beads of coral and gold, and sometimes of coral alone, are worn by the chiefs and their principal followers. Such necklaces are worn by
262 women also on *gala* occasions. The staple diet of both Khasis and Syntengs is rice and dried fish. They are, however, fond of all kinds of meat, especially pork. Some of the Syntengs abstain from beef,
[177] owing no doubt to Hindu influences. Neither Khasis nor Syntengs eat dog, which is partaken of with zest by the Naga and the Garo tribes,—this is owing to the dog being considered by the Khasis to be the friend of man. Neither Khasis nor Syntengs use milk, the latter being thought by them to be an excrement. Neither Khasis nor Syntengs
411 tattoo. The weapons of both Khasis and Syntengs are bows and arrows, swords and shields. The national game of the Khasis is archery, regarding which a detailed description will be found in paragraph 10.

The people live in regular villages on fixed sites which have not
361 changed for generations,—and they appear to be much attached to these sites, where, as a rule, the family tombs are standing. The houses are
342 built in the shape of a shell, the houses being divided into three compartments,—the *Shyngkup*, or porch, where odds and ends, and sometimes fowls, are kept; *nengpei*, or centre room, which is used for cooking and sitting in; and *rumpei*, or inner room, where the people sleep. The houses are low, with grass roofs reaching nearly to the ground, the beams are of hewn timber, the walls are of either planks roughly hewn or of reeds or split bamboos plastered with clay. The Khasis' houses generally have boarded floors raised some feet from the ground level,

[p. 1]

KHASI KINSHIP AND SOCIAL ORGANISATION

BY

PROF. K P. CHATTOPADHYAY.

Introduction

114 121 In a paper on Khasi marriage rules Prof. Hodson has tried to explain the special features of the Khasi kinship terms and marriage rules on the hypothesis of a former dual division of Khasi Society, and certain new social forces which came into operation when the dual society broke up (1).

Hodson used for his work, the kinship terms noted in the Assam Census Report (2), Gurdon's work on Khasis (3) and a dictionary by U. Nissorsing. A full list of Khasi kinship terms was published by Rai Bahadur S. C. Roy shortly afterwards (4). The list is stated to have been compiled with the help of the ex- Siem of Cherra, on the genealogical method. The genealogies have not however been printed, and detailed notes are not available.

Recently the writer of this paper proceeded to the village of Mawphlang, the head-quarters of the Khasi State of this name and collected a certain amount of data to discuss this problem. The village is situated to the southwest of Shillong, at a distance of sixteen miles, and has preserved the old customs to a fair extent. It is ruled over by a lyngdoh or priest-chief, assisted by four myntris. At the time of the visit, the lyngdoh was away, suspended by the Political Agent for misgovernment, and the powers of the State were vested in the council of myntris. The senior myntri U Subu Rai, who is an old man

602 [361]

[this source has been processed for the AR7 Khasi file — Analyst.]

342 huts the ground plan is entirely rectangular. In this type of huts the materials used are also different, the corrugated sheets and wooden planks being more used than blocks of stone and thatching grass. The inner apartments, however, conform to the old plan. In the market place of the village there are some houses which are two-storied, the front of the ground floor of which have been utilised for shops. These houses do not at all conform to the old 'U'-type but are square or rectangular in
342 ground plan. Near the market place there are three houses
177 of well-to-do Khasis which resemble the bungalows of Europeans of Shillong (and of the Mission house at Mawphlang) in their structure and material. In these modern houses unlike the old ones the main door faces the street. The myntr U. Suburai who is one of the well-to-do persons of Mawphlang village has his old house (that is, the old house he put up for his wife after marriage) of the 'U'-type, the description of which has been given in the preceding table under the name of the owner, the wife of U Suburai, Ka Shyrngeh. But their new house which has been added to their old one in front of it is altogether of the bungalow type. This new house is entered from a porch in front, leading to the central room which is used as parlour. The myntri generally sits here with his friends, round the fire-place, which is not a Dypei but a hearth in European style. The kitchen is beyond this room. Bedrooms open from the drawing room to the sides.

342 A plan of the village showing the distribution of the various
●361 types of hut in Mawphlang is given below. From the plan it
177 will be found that out of the 160 houses in the village, inhabited at present, the typical 'U'-type of huts form about 11·3 per cent.; the flattened 'U'-type about 35·0 per cent.; the intermediate type, which has totally given up the 'U'-shaped ground plan but has its interior of the old type, about 27·5 per cent. and the English bungalow type about 26·2 per cent. This data shows how rapidly the old type of Khasi hut is now changing.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

I. Setting and Economic Background of Sohkynduh and Kongton

361 692 [131] Sohkynduh and Kongton are villages of the Kadashinong,[1] one of the areas under the Cherra Chief. The Kadashinong is situated on the southern slope of the Khasi Hills, in what is called War country. These two villages are situated at the farthest point from both Shella, the centre bordered by the plain, and Cherrapunjee, the seat of the Cherra Chief, one of the centres of the upland Khasi Hills. The people 184 121 [171] at Cherrapunjee say that these villages are one of the most backward parts of the Khasi Hills. They correspond to Rombagiri in the Garo Hills, as they lie in the innermost parts and more traditional economic and social settings have been preserved there than in other villages. These are also the reasons why I selected those villages as my field.

361 [131] [487] It is nine miles to Sohkynduh from Cherrapunjee, crossing two deep valleys towards the east. Kongton is located at the heart of the mountain ranges, ten miles from Cherrapunjee, towards the north-east. It is about twelve miles from Sohkynduh to Kongton, and the way leads through one of the most difficult passes, where even villagers seldom travel. In December, 1955, Sohkynduh was a com- [162] munity of 48 households (List 6), and Kongton of 62 households (List 9). The settlements of both villages are clustered in the southern depressions of a mountain, not far from the summit, a typical location [134] of Khasi villages. Sohkynduh has poor soil, covered with plenty of pieces of stones. The yield therefore is very poor. On the other hand, Kongton, a much older village, enjoys fertile soil, and is one of the most prosperous communities in the Kadashinong.

241 423 [171] [241] The major economy of both villages is shifting cultivation. We have already seen, in the chapters on the Garo, the fundamental technique of "Jhuming cultivation." The differences between the Garo and the Khasi shifting cultivation are to be found in two aspects: one is the nature of the crops and the other is the type of landowner-ship. In this area, the main crop is millet, while that of the Garo is rice. Besides the shifting cultivation, the Khasi have pan-leaf gardens and sometimes pineapple gardens, though on a small scale and not in every household. The most important feature of Khasi shifting cultivation is the development of private ownership. In the tribal areas in Assam, such private ownership of the jhum field is quite an

1. Kadashinong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkynduh, Ryummai, Mawkaoma, Mawshiet, Mawmang, Kongton, Shyntiang, Kruhiawhiar, Pilei, Tendum, Nongpriang, and Dongpaw. (Khasi spelling follows the customary usage in Cherra State.)

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi-Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional custom nor a simple blueprint of ill-fitting all-India legislation. The major political schism at this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. [Cf. Gait 1926; Aitchison 1931; Bhuyan 1949; Morris 1910.]

175 619 648 [726] [651] [177] 177 648 [244] [439] [134] [797] [428] [635] [633] [167] [563] [423] [973] 648 642 [651] [563] [113]

SETTLEMENT PATTERN AND HOUSING. Settlement pattern. Khasis live sedentarily in named, nucleated, and unplanned villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

361 • [312]

pendable water supply. Villages are about two to five miles apart, and have no boundary markers. In the past, villages contained semipublic buildings and grounds: the home of the village priest (also the home of a chief if he resided in that village), the village marketplace, and tree groves, cremation grounds, or other awesome spots that were believed to be inhabited by supernatural beings. Villages today may have also one or more Christian churches, government social welfare buildings, and schools. Formerly, villages were entered through a guarded gateway; this is no longer the case, and paths feed into villages from all directions. Often several villages are nucleated into one large unit, named and also described as a "village." These were once defense units, but were so uncohesive otherwise that institutionalized rivalry obtained among the component villages. Now, they have been integrated through the agency of all-village public services, especially schools. **Housing.** The traditional Khasi house is entered through a door at the rounded end of a U-shaped ground plan, and is about 20 feet at widest extent; it is about 30 feet deep, and is elliptical or hogback in profile. Its walls are of stone blocks cemented with mud. The roof of grass thatch, supported by a bamboo frame, overhangs the walls on their outside, down to about three feet above the ground. The house is divided into two parts: the front one-third is on the ground level, floored either with stone blocks or tamped earth, and is used for storage of occupational instruments and as a shelter for poultry. The rear two-thirds is raised four feet on piles of stone blocks to a platform of planks, and is partitioned into six rooms, comprising a kitchen, areas for storage of food and water, and sleeping quarters. Furniture is minimal, and the house is totally undecorated. There are no windows, and no smoke vents. A house generally has a companion shed, walled of wood and grass matting and thatched with grass. This serves as a pigsty, but it may be partitioned also to house cows, and it may have a loft for fuel storage. Compounds often contain garden plots, and are fenced around with stone or bamboo and mud. Nowadays, the traditional house has given way to Western-style bungalows of wood and tin, especially in and around Shillong. [Cf. Mukherjee et al. 1941.]

361 [944] [443] [778] [344] [178] [712] [628] [178] [182] 342 352 353 354 343 351 177 184 342

ECONOMY. The Khasi economy is a market economy based on agriculture, and most Khasis are primary producers, sellers, middlemen, and/or providers of services in connection with markets. Khasis are often multioccupational: they produce goods for partial subsistence, and also play some part in trade. **Agriculture.** On the Shillong plateau, the major field crops are potatoes, maize, millets, and dry rice, still produced mostly through swidden farming, with a two- to three-year period of fallow, but increasingly through continuous use of a single field with the aid of ma-

241 433 443 [463] 241

Khasi AR7

211 rude stone monuments. At the village of Nougshai, near
[101] Shillong, are to be seen some very striking monoliths; and
[131] although they do not come up quite to the length of those at Nurtiang (noticed by Dr. Hooker in his "Himalayan Journals"), yet they are very worthy of being mentioned. They stand on
[133] the open spur just above the village, and have been worked out of the beds of the Shillong sandstone series, and some of the smaller blocks have been taken from the conglomerate beds, the lowest in the series, and which come in, in the bed of the ravine, to the north of the spur. There are a number of monuments on this site, large and small, arranged both in line and on two sides of a square; the two largest have their central monoliths—height, 24 ft. 3 in.; width, 5 ft. 6 in.; thickness, 8 in.; and height, 23 ft. 2 in.; width, 2 ft. 9 in.; thickness, 1 ft., respectively.

[126] Plate ii., which is taken from a photograph by Mr. William Robert, Assistant Surveyor in the Khasi Hills survey party, gives an excellent idea of the second largest structure, showing the very massive flat-stone, the "Mao Kynthai," in front. This structure consisted of thirteen upright stones, which could not all be brought into the field of the camera; but the six outside
175 stones on the right are shown. Many of the slabs in the adjacent monuments have been overthrown and broken quite
211 recently, perhaps by Sepoys and camp followers from the military station close by. At one time a mountain battery of Eurasian Artillery was quartered there, and I attribute the overthrow of so many of the stones in the neighbourhood to their handiwork, who would look on such amusement as a "great lark." The Sepoy (native of India) is not of a mischievous disposition; the European and half-European (uneducated) is markedly so. Thus the monument with the highest stone is imperfect, and it must, when perfect, have been a very handsome one. This is a sad pity, after the time and labour that must have been expended in its erection.

361 I did not observe any new slabs anywhere in the immediate
712 neighbourhood. Nougshai must formerly have been a large
[211] and powerful village; it stands on a naturally very strong position, and old lines of fortification are to be traced on many sides, especially on the approach from the direction of the Falls of the Umiam. These old lines of defence are on a curious system: a ditch and bank have been carried forward from the main defences from 200 to 300 yards down the ridge of the spurs, thus effectually preventing an enemy working round the hill sides below the villages.

174 This fortified site points to a state of things in these hills
712 when the relations between the large village communities or
628

743 The table above clearly shows that the medical facilities obtainable in these villages are far from satisfactory. Only 6 villages out of 28 villages have a dispensary either located in the village or within a radius of five miles. Considering the lack of communication facilities and the hilly nature of the district even five miles is often too long a distance for a patient to go to the doctor or for a doctor to attend a patient. When the doctor has to cover long distances the charges become too high. As a result the poorer sections in case of serious illness have to approach unqualified medical men when one is available or otherwise to depend upon the mercy of God. Even for quinine and other cheap medicines one has to go to a dispensary or a private medical practitioner miles away. Reportedly, the more disheartening fact is that the medical help received by the people from Government dispensaries are not often timely and adequate due to non-availability of a doctor and in-adequacy of stock of medicines.

361 364 4.4 **Sanitation.**—Though conditions of housing, sanitations, etc., of the villages are described in village notes in the appendix, it will be pertinent to make some general observations on the point. Unlike other hill tribes, the Khasis select their house sites on the hill slopes and level lands by the side of the hills as a protection from winds. From the fact that the villages are situated in the slopes one might be tempted to think that the sanitary and drainage system of the villages should be quite satisfactory. But in fact it is otherwise in many cases particularly in the case of big villages where too many families huddle up constructing their houses very close to each other thus practically converting the village into a slum. Many of the villages, due to their very location in groves surrounded by thick jungles do not get sufficient sun-light and as a result always remain damp, facilitating frequent incidence of cold and influenza. People answer the call of nature in jungles and bushes in and around the villages. Many of the villages are built on level lands full of swamps, mud and tall weeds, places which provide good breeding place for mosquitoes. Cowsheds and pig sties are built close to the residential quarters which make the villages all the more dirty. Indeed, there are villages enjoying excellent sanitation and health but in majority of the villages there remains a lot to be done for improving the sanitary, drainage systems for educating the people to make their villages more hygienic. From the Government side also, elaborate measures should be adopted to combat and eradicate malaria which is still causing [312] havoc in the district. Similarly, drinking water supply schemes should receive a high priority in a programme of development.

342 4.5 **Housing.**—Majority of the houses in the interior areas are made of thatch and bamboo with wooden planking or stone or earthen floor. Walls are plastered with mud. In higher altitudes houses are lowly roofed presumably as a protection against wind and heavy rain. Some of these houses assume the shape of a half buried cylinder. They generally have only one opening through the main door, though some of them have another in their rear end. They generally contain only two small rooms. One who is not used to such conditions wonders how the inmates, especially when there are five or six of them, could feel comfortable. Houses of the well-to-do people particularly those on the road side, are built in the modern style with C.I. roofing, plank floor, mud plastered, whitewashed

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

361 In the interior of the Hills the largest villages are mere clusters of
463 huts. The great majority of the inhabitants are employed in agriculture, but there are no data upon which a proportion of agriculturists to non-agriculturists could be based.

167 There is no immigration into the District. Both the Khásiás and
178 the Syntengs have been successful in preserving to the present day their primitive isolation, free from the interference of Hinduism. They still maintain their aboriginal forms of belief and re-
[771] ligious worship, and repudiate alike the authority of Bráhmans and
[262] the entire system of caste. To some extent, however, they have given way to Hindu prejudices in the matter of purity of food. The
[563] few Hindus to be found in the Hills are temporary residents, engaged in civil and military employ, who always contemplate returning
[441] to their own homes. The traders are for the most part natives of the Hills; for the Márwárí merchants, who penetrate into every other corner of Assam, have been able to obtain no footing in the face of Khásí competition. There is likewise no emigration from the District. The hillmen are a well-to-do and contented race, and either produce themselves or obtain by trade sufficient to satisfy
[166] their scanty wants. A certain number of both Khásiás and Syntengs proceed southwards every year to work on the tea gardens of Cáchár and Sylhet, but such absence from home is only temporary.

243 AGRICULTURE: RICE.—Thirteen different varieties of rice are cultivated in the District, of which the following is a list, giving the Khásí name as well as the description of the grain:—(1) *U-kyba-khynriam* (*u*, the masculine article, meaning 'the,' and *kyba*, noun masculine, meaning 'paddy'), brown rice with long grain; (2) *u-kyba-khynriam bai-lih*, a white rice with long grain; (3) *u-kyba la-toh*, round-grained rice; (4) *u-kyba ksai*, bearded, husked; (5) *u-kyba-dew-ba-iong*, black husked rice (literally *u* = 'the,' *kyba* = 'paddy,' *dew* = 'earth,' *ba* = 'that,' *iong* = 'black'); (6) *u-kyba-ba-lih*, white rice; (7) *u-kyba-scim*, scented rice (literally *u* = 'the,' *kyba* = 'paddy,' *scim* = 'royal'); (8) *u-kyba la-kroh*, large-grained rice; (9) *u-kyba-ba-tlang*, small-grained rice; (10) *u-kyba sa-bia*, early rice; (11) *u-kyba ru-bon*, late rice; (12) *u-kyba tang-la*, rice grown along with beans; (13) *u-kyba-ba-túh*, small rice.

Rice is cultivated in marshy fields situated near running water as well as in high lands. The first seven of the above thirteen species of rice are sown in marshy lands during the months of April and May,

Hills, the kindred Synteng in the Jaintia Hills. The Lynn Gam who are classified by Gurdon as half Khasi and half Garo live in the western part of the Khasi Hills, the people who inhabit the low hill country in the north of the district, which is usually called "Bhoi," are named the Bhoi. Many of them are really Mikir. My obser-
●361 vations of the Khasi are limited to the surrounding of Shillong from where I visited the village of Nongkrem which is about 13 kilometers away (75).

75. Cf. C. Becker, Anthropos 4 (1909), pp. 892-902.

The place is located in a trough between low hills which are covered by large stone boulders. A small water course runs through the village. The huts are partly built along the slopes of the hills which surround the village. The houses
342 (Plate X, 4) all stand on small plots of land which are separated from each other by low stone walls; a narrow passage leads to them from the front side. Sometimes this passage is completely missing, in which event one has to climb over the wall. The houses stand on foundations of layers of irregular stone boulders. The walls are made of wooden boards--sometimes of bamboo--and are covered on the outside by grass. Grass is also used for roofing. Each strand is tied individually to bamboo poles, as in Burma (not as in Bengal where it is squeezed together between bamboo poles). Especially typical is the form of the roof; it is high and steep in the middle and the roof ridge is curved. The roof slopes down

178 like the Zemi-Naga, the Cacharee and the Kuki. But after the period of
563 economic prosperity as I shall describe in the next section, the Jatinga people
621 reached a rather high level of education, while most of the neighbouring tribes
[871] remained illiterate. Their standard of living likewise improved. Fashionable girls of Jatinga who have studied at the Convent school in Shillong, and speak English and Hindi, cannot marry half-naked tribesmen who work in the jungle. They prefer to intermarry with Moslem, Panjabee or Assamese who belong to amore sophisticated community, and through whom they can enjoy urban life. Thus the orientation of the intermarriage of the people of Jatinga has changed, along with the growth of Jatinga.

It should be noted that intermarriages came mostly through the contacts at Haflong, where people used to go once a week for the bazaar, rather than through direct contacts with neighbouring villages.

Economy of Jatinga and its Relation to Neighbouring Tribes.

178 It is very interesting to find two different kinds of economy in the same
171 ecological background: Jatinga Khasi practise pan-leaf and orange cultivation
245 and depend mainly on a trading economy, while the other neighbouring tribal peoples practise jhum cultivation, almost a subsistence economy. This situation has remained unchanged for the last fifty years since the establishment of Jatinga village.

101 The first Jatinga immigrants occupied one ridge of the mountain where the
245 present Jatinga is situated. Formerly, this land belonged to the Zemi-Naga, one of the old inhabitants of the Cachar Hills, who possessed a vast jungle area for jhum cultivation. It seems that there was no objection to the Khasi occupying this small spot: it was apparently too small an area for the jhum cultivator —pan-leaf cultivation of the Khasi requires less than one twentieth of the land of the usual jhum cultivation. The Khasi who started pan-leaf cultivation were able to accumulate some capital, and after several years they started orange gardens. They had had experience of orange cultivation in their homeland, but this was the first time they had operated commercially.

245 The success of this orange cultivation was beyond their dreams. Hearing
434 of good oranges at Jatinga, many Bengalee merchants from Dacca, Sylhet,
439 Silchar and Gauhati began to come to buy them. Moreover, the village had the great advantage of being situated near the railway station. Oranges were
[496] sold by carloads. Unimaginable wealth came to the Jatinga people. Especi-
[871] ally the founder's family, including his brother's and sister's, became extraordinarily wealthy; their income used to be Rs. 20,000 a year. The children were sent to the school which was established in the village and some were educated at colleges in Dacca, Sylhet and Shillong. The villagers had
[362] beautiful houses built by Manipuri and Bengalee carpenters. Actually the houses of Jatinga were known as some of the best construction in Assam.

Like the Shella people, they were managers of gardens and employed workers.
245 Wealthy households used to engage several labourers annually, most of them
46 from Jaintia where the Jatinga people had originated. These workers were provided with shelter in the servant quarters of their employer's house, but they had to provide meals for themselves. They were paid daily according to the work done. They were available to other households, when their employer had no work. Some labourers were also engaged locally among the Zemi-Naga, the Cacharee and the Kuki, though not as many as among the Jaintia.
245 These local tribes were fairly well occupied by their jhum cultivation, and not
464 used to being employed as workers. Therefore, most of them were not regular

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

137 and other trees. These are the sacred groves. Here the
778 villagers worship *U ryngkew U basa*, the tutelary deity of
the village. These groves are taboo, and it is an offence to cut
[776] trees therein for any purpose other than for performing funeral
361 obsequies. The groves are generally not more than a few
hundred yards away from the villages. The villages of the
137 Syntengs are similar in character to those of the Khasis. The
245 Wár villages nestle on the hill-sides of the southern border, and
are to be seen peeping out from the green foliage with which
the southern slopes are clad. In the vicinity of, and actually
up to the houses, in the Wár villages, are to be observed large
groves of areca-nut, often twined with the *pan* creeper, and
of plantain trees, which much enhance the beauty of the scene.
Looking at a Wár village from a distance, a darker shade of
green is seen; this denotes the limits of the extensive groves
where the justly celebrated Khasi orange is grown, which is the
361 source of so much profit to these people. The houses in the
Wár villages are generally closer together than those of the
Khasis, probably owing to space being limited, and to the
[363] villages being located on the slopes of hills. Generally up the
narrow village street, and from house to house, there are rough
steep stone steps, the upper portion of a village being frequently
situated at as high an elevation as 200 to 300 ft. above the
lower. In a convenient spot in a Wár village a clear space is
to be seen neatly swept and kept free from weeds, and sur-
rounded with a stone wall, where the village tribunals sit, and
the elders meet in solemn conclave. Dances also are held here
778 on festive occasions. At Nongjri village there is a fine rubber
796 tree, under whose hollow trunk there are certain sacred stones
where the priest performs the village ceremonies.

361 The Bhoi and Lynngam villages are built in small clearings
in the forest, the houses are close together and are built often
[363] in parallel lines, a fairly broad space being reserved between
[351] the lines of houses to serve as a street. One misses the pretty
gardens of the Wár villages, for Bhois and Lynngams attempt
nothing of the sort, probably because, unlike the Khasi, a Bhoi
or Lynngam village never remains more than two or three years
in one spot; generally the villages of these people are in the
vicinity of the forest clearings, sometimes actually in the midst

743 The table above clearly shows that the medical facilities obtainable in these villages are far from satisfactory. Only 6 villages out of 28 villages have a dispensary either located in the village or within a radius of five miles. Considering the lack of communication facilities and the hilly nature of the district even five miles is often too long a distance for a patient to go to the doctor or for a doctor to attend a patient. When the doctor has to cover long distances the charges become too high. As a result the poorer sections in case of serious illness have to approach unqualified medical men when one is available or otherwise to depend upon the mercy of God. Even for quinine and other cheap medicines one has to go to a dispensary or a private medical practitioner miles away. Reportedly, the more disheartening fact is that the medical help received by the people from Government dispensaries are not often timely and adequate due to non-availability of a doctor and in-adequacy of stock of medicines.

361 364 **4.4 Sanitation.**—Though conditions of housing, sanitations, etc., of the villages are described in village notes in the appendix, it will be pertinent to make some general observations on the point. Unlike other hill tribes, the Khasis select their house sites on the hill slopes and level lands by the side of the hills as a protection from winds. From the fact that the villages are situated in the slopes one might be tempted to think that the sanitary and drainage system of the villages should be quite satisfactory. But in fact it is otherwise in many cases particularly in the case of big villages where too many families huddle up constructing their houses very close to each other thus practically converting the village into a slum. Many of the villages, due to their very location in groves surrounded by thick jungles do not get sufficient sun-light and as a result always remain damp, facilitating frequent incidence of cold and influenza. People answer the call of nature in jungles and bushes in and around the villages. Many of the villages are built on level lands full of swamps, mud and tall weeds, places which provide good breeding place for mosquitoes. Cowsheds and pig sties are built close to the residential quarters which make the villages all the more dirty. Indeed, there are villages enjoying excellent sanitation and health but in majority of the villages there remains a lot to be done for improving the sanitary, drainage systems for educating the people to make their villages more hygienic. From the Government side also, elaborate measures should be adopted to combat and eradicate malaria which is still causing [312] havoc in the district. Similarly, drinking water supply schemes should receive a high priority in a programme of development.

342 4.5 **Housing.**—Majority of the houses in the interior areas are made of thatch and bamboo with wooden planking or stone or earthen floor. Walls are plastered with mud. In higher altitudes houses are lowly roofed presumably as a protection against wind and heavy rain. Some of these houses assume the shape of a half buried cylinder. They generally have only one opening through the main door, though some of them have another in their rear end. They generally contain only two small rooms. One who is not used to such conditions wonders how the inmates, especially when there are five or six of them, could feel comfortable. Houses of the well-to-do people particularly those on the road side, are built in the modern style with C.I. roofing, plank floor, mud plastered, whitewashed

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

disfigured from the practice. Adults will chew as many as four or five betel-nuts a day, with the usual accompaniment of *pán* leaves. The estimated cost of maintaining an average family of the labouring class is about Rs. 8 or 16s. a month. 276 [434]

TOWNS: SHILLONG.—There are no towns in the usual acceptance of the word; but the chief places in the Hills, looked upon by the inhabitants as cities, are Shillong, Jowái, Cherrá Púnjí, and Shellá. According to the Census of 1872, Shillong had only 1363 inhabitants, Cherrá Púnjí 443, and Jowái 4502. Jowái, however, is a collection of rural hamlets, and the population of Shillong has entirely altered since the date of the Census. The latter place first became the Civil Station in 1864, in substitution for Cherrá Púnjí; and when Assam was erected into an independent Province in 1874, it was selected as the permanent seat of the Local Government. The Chief-Commissioner resides there, and also the heads of all departments in the Administration. The area of the Station is 7 miles in length by 1½ to 1¾ miles in breadth. A considerable native population is already settled, and is increasing from day to day. One of the largest weekly markets is held in the *bázár*; and with a view to facilitate access to the Station, which is the sanitarium for the Province of Assam, a cart road has recently been completed to Gauháti on the Brahmaputra, which will tend to make the place more and more important. An excellent water supply is introduced into Shillong through an aqueduct which has its source in the neighbouring hill streams, and sanitary measures are carefully enforced. Large sums of money have annually been expended on the erection of the public buildings necessary for the offices of the administration. A printing-press has been established, from which issue all the official documents and reports of the Province. The climate is excellent, the temperature being more equable than that of any other hill station in India, and therefore admirably suited to the constitution of Europeans. There is a church at Shillong, and a chaplain on the Bengal establishment officiates both there and at Gauháti. The cantonments were occupied in 1875 by the 43d Regiment of Assam Light Infantry, with three outposts. The strength was 9 European officers, 16 native commissioned officers, 80 non-commissioned officers, 772 fighting men, and 58 paid camp followers and non-combatants; grand total, 935. The total cost, including contingencies, was Rs. 189,190, or £18,919.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

731 pre-eminently filthy villages on the Cherrá Púnjí plateau the epidemic appears to have found a fitting home, for it stayed among them for a period of nine weeks and a half. The civil surgeon reports the deaths at Cherrá Púnjí and the surrounding villages to have amounted to about 175 out of a total of 232 cases. During the year 1876-77 hooping-cough and small-pox were prevalent in an epidemic form. In the Jáintiá Hills small-pox is stated to have caused 47 deaths, chiefly during the months of June, July, and August. Some fatal cases of hooping-cough occurred among the Khási children in the village of Máokhar, near Shillong. The only two cases of cholera reported were in the Jáintiá Hills.

16 VITAL STATISTICS.—A general system of registration is not [659] attempted throughout the Khási and Jáintiá Hills District. Statistics [648] of births and deaths are only collected among the inhabitants of the Stations of Shillong and Cherrá Púnjí, and in the selected area in the vicinity of Jowái, which comprises the following seven villages:—Jowái, Nongbah, Nartiang, Mynsau, Amwí, Ralliang, and Shampúng. This selected area has a population of 12,504. Each village forms a distinctly-circumscribed community, in which the statistics are readily ascertained and reported by the *dolloi* or head-man. The returns may be regarded as extremely close to the truth, both for births and deaths; and they thus furnish an approximate statement of the health of the entire Hills. In 1874 the total number of deaths in the selected area was 351, showing a death rate of 28 per thousand; the number of births was 431, or 34·4 per thousand. The total population of all the places in which vital statistics are collected is 15,458 persons, among whom 428 deaths were recorded in 1874, showing a death-rate of 27·6 per thousand, as compared with 27·3 per thousand in the preceding year. The deaths were thus distributed—24 from cholera, 296 from fever, 38 from bowel complaints, 2 from snake-bite or wild beasts, and 68 from all other causes. The mortality from fevers was the highest recorded throughout the entire Province. On this the civil surgeon observes:—'There are few local sources of malaria in the Hills. Many of the deaths from fever were probably due to typhoid, induced by the use of impure water and by the filthy state in which the people live. There is no attempt at conservancy in a Khási village. 312 In Jowái, a good specimen of the class, the lanes and pathways are 364 strewn with excrement and house refuse. Drinking water is got 164 from wells in the heart of the village, fed by the drainage of the

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

312

surface soil of the hills upon which the houses are built.' Cholera is attributed to importation from the plains. 364 [164]

SANITATION.—It has already been stated that the ordinary Khási villages are absolutely destitute of any conservancy arrangements. The sanitary condition, however, of the Station of Shillong is described as 'good.' The natural drainage is excellent. Drinking water is obtained chiefly from hill streams, and on the banks of these streams conservancy regulations are enforced. The water is conducted into the town by means of an artificial water-course. Public latrines have been erected at suitable places inside the town. The staff of sweepers and *beldárs* keeps the roads and drains clean, and the surface generally free from pollution. The sanitary condition of the cantonment is reported to be very good.

CHARITABLE DISPENSARY.—There is one dispensary in the Khási and Jáintiá Hills—at the Station of Shillong. It was first opened in 1872, and considerable additions have since been made to the building. During 1874 a total sum of Rs. 775. 8, or £77, 11s., was expended on new constructions and repairs, towards which the European residents subscribed Rs. 329. There is now accommodation for 10 male and 3 female patients. In that year the total number of in-door patients treated was 44, of whom 9 died, giving a death-rate of 20·45 per cent. The number of out-door patients was 529, or an average daily attendance of 7·8. Of the grand total of patients of both classes, only 31 were females. The largest number of cases are classified under the headings of fevers and constipation and colic. The total income during the year was Rs. 1598. 13. 9, or £159, 17s. 8d., of which Government contributed Rs. 300 for salaries, and an additional Rs. 300 as a special allowance. The European subscriptions amounted to Rs. 869, as compared with Rs. 33 subscribed by natives. The total expenditure was Rs. 1187. 15. 6, or £118, 16s., leaving a balance in hand of Rs. 410. 14. 3. The chief items were Rs. 480 for salaries of medical subordinates, Rs. 160 for servants' wages, and Rs. 222 for dieting of sick. There were 53 minor operations performed during the year. 743 [164]

The people of the District have no system of medicine of their own, and no native practitioners. Their sole remedies consist in divination and incantation. The only indigenous native drugs are chireta and wormwood. As stated in a previous paragraph, a small cinchona plantation was established by Government at Nongklao in 1867. 755 278 648 654

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

133 they form rapids, the waters precipitating themselves down deep, rocky gorges and chasms, choked with huge boulders. Some of these gorges are very beautiful; the streams, being hemmed in between stupendous mountains and rocks covered with primeval forest, run in narrow but very deep channels swarming with fish. No islands or lakes are formed by any of the rivers, although several of them have large, deep pools. They are all unfordable during the rains.

312 Utilization of the Water Supply.—None of the rivers are utilized as a motive power for turning machinery, although the streams on the higher plateaux might be easily turned to such an account. Their waters, however, are extensively used for the purposes of irrigation, and the hill people display great ingenuity in cutting channels or aqueducts for leading the water on to their fields. It is in this manner that the Civil Station of Shillong [365] receives its water supply. Aqueducts convey water to the houses of all the European residents; and branch channels from the main aqueduct flow through the *Máwár*, and along the streets occupied by the native inhabitants. No fishing towns exist in the hills; but [226] near where the rivers debouch upon the plain are some valuable [563] fisheries, which are annually let in farm, the lessees being generally Bengális. These fisheries yield an annual Government revenue of about £300. Embankments in order to protect the land against floods do not exist. A few embankments, or rather dams, are thrown across narrow valleys between hills, so as to create reservoirs for water. At Shillong there are a few tanks thus formed, which are both useful and ornamental.

135 Minerals, etc.—Coal and limestone, both of excellent quality, are found in abundance. Lower Bengal obtains nearly the whole of its lime supply from the Khásí and Jáintiá Hills. The lime is known as 'Sylhet lime,' and is obtained by quarrying from the beds of stone which line the base of the mountains along the whole length of the Sylhet boundary. The supply is literally inexhaustible. Coal out-crops at Cherrá Pínjí, Lá-ká-dong, Shellá, Máo-syn-rám, and at several other places; but as a rule it is scattered, and found in places difficult of access. The coal, however, is of excellent quality, and leaves very little ash. Stone, well adapted for building purposes, is also found. Ironstone exists almost everywhere throughout the Hills, but principally in the dependent States of Khyrim, Nongpung, Cherrá, and Myllíem. In former years the Khásás were 000

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

disfigured from the practice. Adults will chew as many as four or five betel-nuts a day, with the usual accompaniment of *pân* leaves. The estimated cost of maintaining an average family of the labouring class is about Rs. 8 or 16a. a month. 276 [434]

TOWNS: SHILLONG.—There are no towns in the usual acceptance of the word; but the chief places in the Hills, looked upon by the inhabitants as cities, are Shillong, Jowai, Cherrá Pinji, and Shellá. According to the Census of 1872, Shillong had only 1363 inhabitants, Cherrá Pinji 443, and Jowai 4502. Jowai, however, is a collection of rural hamlets, and the population of Shillong has entirely altered since the date of the Census. The latter place first became the Civil Station in 1864, in substitution for Cherrá Pinji; and when Assam was erected into an independent Province in 1874, it was selected as the permanent seat of the Local Government. The Chief-Commissioner resides there, and also the heads of all departments in the Administration. The area of the Station is 7 miles in length by 1½ to 1¾ miles in breadth. A considerable native population is already settled, and is increasing from day to day. One of the largest weekly markets is held in the *Aduir*; and with a view to facilitate access to the Station, which is the sanitarium for the Province of Assam, a cart road has recently been completed to Gauhátí on the Brahmaputra, which will tend to make the place more and more important. An excellent water supply is introduced into Shillong through an aqueduct which has its source in the neighbouring hill streams, and sanitary measures are carefully enforced. Large sums of money have annually been expended on the erection of the public buildings necessary for the offices of the administration. A printing-press has been established, from which issue all the official documents and reports of the Province. The climate is excellent, the temperature being more equable than that of any other hill station in India, and therefore admirably suited to the constitution of Europeans. There is a church at Shillong, and a chaplain on the Bengal establishment officiates both there and at Gauhátí. The cantonments were occupied in 1873 by the 43d Regiment of Assam Light Infantry, with three outposts. The strength was 9 European officers, 16 native commissioned officers, 80 non-commissioned officers, 770 fighting men, and 58 paid camp followers and non-combatants; grand total, 933. The total cost, including contingencies, was Rs. 185,190, or £18,519.

considering. Some of the leading characteristics of the Lyngams will now be detailed. The Lyngams are by complexion swarthy, with features of Mongolian type. The men are of middle height and the women remarkably short, both sexes being not nearly so robust as the Khasis, a result due probably to climatic influences, for the Lyngams live in fever-haunted jungles. The men have very little hair about the face, although a scanty moustache is sometimes seen, the hairs in the centre being carefully plucked out, the result being two tufts on either side. Beards are never seen. The women are ill-favoured, and wear very little clothing. The men wear the sleeveless coat of the Khasi and Mikir pattern, called *phong-marong*, which is made of cotton dyed red, blue, and white. This custom may have been borrowed from the Khasis. They do not grow their own cotton, but obtain it from the plains. They make their own dyes, *changlong* (red) and *kar sai-long* (black). A cotton cloth, barely enough for purposes of decency, is tied between the legs, the ends being allowed to hang down in front and behind. Sometimes an apron is worn in front. At the present day the men wear knitted woollen caps, generally black or red, of the Nongstoin pattern (a sort of fisherman's cap), but the elderly men and head-men wear turbans. The females wear a cotton cloth about eighteen inches broad round the loins, sometimes striped red and blue, but more often only dark blue. A blue or red cloth is thrown loosely across the shoulders by unmarried girls, but married women only wear the waist-cloth, like the Garos. A cloth is tied round the head by married women, sometimes, Garo fashion. The women wear quantities of blue beads as necklaces, like their Garo sisters. They obtain the beads from the Garo markets at the foot of the hills. Brass ear-rings are worn by both sexes; the women, like the Garos, load their ears to such an extent with brass rings as to distend the holes greatly. Silver armlets are worn by the head-men only, or by those who possess the means to give a great feast to the villagers. This is the custom of the Garo *sokmas*, or head-men. Both sexes wear bracelets. The men also wear necklaces of beads. The rich wear necklaces of cornelian and another stone which is thought by the Lyngams to be valuable. A necklace of such stones is called *o'piong blei* (god's necklace).

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

vation is impossible because of the cold climate. In the past, Khasi economy must have remained at a very primitive stage. 178 244

Potato cultivation has been much encouraged along with the development of Shillong and the opening of the motor road to Gauhati from Shillong after the Independence of India when Shillong became the seat of the Assam Government, as well as the capital of the Khasi-Jaintia Hills. Shillong has become an important trading centre, where big merchants collect the harvests of potatoes in exchange for rice, clothes and various other goods from the Assam valley. These changes have introduced the Khasis into an active commercial economy which again has brought about various changes in their social life. Recently coal excavations have started in the upland Khasi Hills, and many Khasi become miners. 178 433 369 [244] [633] [491] [439] [316]

Thus the history of the Khasi Hills during the last hundred years has changed a great deal the picture of the Hills. However, dark corners still remain in Bhoi, War and in the area bordering on the Garo Hills. These have been kept in a vacuum between the Hindu civilization of the bordering plain and the modernization of the uplands centred in Shillong. In these areas, the people are still practising primitive jhum cultivation. I have chosen two villages in War located in one of these area as subjects of my major field-work. 178 184

Garo Hills	117	162
Manipur	69	101
Total	4,091*	

The following information regarding the general aspect of [127] the Khasi and Jaintia Hills district, with some additions, is 133 derived from Sir William Hunter's Statistical Account of Assam. The district consists almost entirely of hills, only a very small portion lying in the plains. The slope of the hills on the southern side is very steep until a table-land is met with at an elevation of about 4,000 feet at Cherrapunji. Higher up there is another plateau at Mawphlang. This is the [361] highest portion of the hills, some villages being found at as high an elevation as close on 6,000 feet above sea level. Fifteen miles to the east of Mawphlang, and in the same range, is situated the civil station of Shillong, at an average elevation of about 4,900 feet. The elevation of the Shillong Peak, the highest hill in the district, is 6,450 feet above sea level. On the northern side of the hills are two plateaux, one between 1,000 and 2,000 feet below the level of Shillong, and another at an elevation of about 2,000 feet above sea level. In general features all these plateaux are much alike, and consist of a succession of undulating downs, broken here and there by the valleys of the larger hill streams. In the higher ranges, where 137 the hills have been denuded of forest, the country is covered 185 with short grass, which becomes longer and more rank in the 374 lower elevations. This denudation of forest has been largely 327 due to the wood being used by the Khasis for fuel for iron smelting in days gone by. The Government, however, has taken steps to protect the remaining forests from further 137 spoliation. A remarkable feature is the presence of numerous sacred groves situated generally just below the brows of the [778] hills. In these woods are to be found principally oak and rhododendron trees. The fir-tree (Pinus Khasia) is first met with on the road from Gauhati to Shillong, at Umsning, at an elevation of about 2,500 feet. In the neighbourhood of Shillong the fir grows profusely, but the finest fir-trees are to be seen

* The figures for Khasi population in the Khasi and Jaintia Hills district will be found under "Habitat."

headquarters of the Administration. The manufacture of country spirit gives employment to a considerable number of persons, most of whom are females. At a recent census of the country stills in the district, undertaken by the district officials, the number of stills has been found to be 1,530. There must be at least one person employed at each still, so that the number of distillers is probably not less than 2,000, possibly more. The spirit is distilled both for home consumption and for purposes of sale, in some villages almost entirely for sale. In the Jaintia Hills stock-breeding and dealing in cattle provides occupation for 1,295 people, according to the last census. The cattle are reared in the Jaintia Hills and are driven down to the plains when they reach the age of maturity, where they find a ready market amongst the Sylhetis. Cattle are also driven into Shillong for sale from the Jaintia Hills. Another place for rearing cattle is the Siemship of Nongkhlaw, where there is good pasturage in the neighbourhood of Mairang. These cattle are either sold in Shillong or find their way to the Kamrup district by the old Nongkhlaw road. Cattle-breeding is an industry which is capable of expansion in these hills. There are a few carpenters to be found in Shillong and its neighbourhood. The Khasis are said by Col. Waddell to be unacquainted with the art of weaving; but the fact that a considerable weaving industry exists amongst the Khyrwang villages of the Syntengs, and at Mynso and Suhtnga, has been overlooked by him. The Khyrwangs weave a special pattern of cotton and silk cloth, striped red and white. In Mynso and Suhtnga similar cloths are woven, also the sleeveless coat. In former days this industry is said to have been considerable, but it has been displaced to a large extent of late years by Manchester piece goods. The number of weavers returned at the last census in the district was 533. The Khasis and Mikirs of the low country, or Bhois as they are called, weave cotton cloths which they dye with the leaves of a plant called *u noli*. This is perhaps the wild indigo, or *ram*, of the Shan settlers in the Assam Valley. The weavers are almost always females. An important means of subsistence is road and building work; a considerable number of coolies, both male and female, are employed under Government, practically throughout the year, in

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

COTTON CLOTHS.

283 In the Jaintia Hills at Mynso cotton is spun into thread, and
288 weaving is carried on there, but on a limited scale. The Mynso people weave the small strips of cloth worn by the men to serve the purpose of the Assamese *lengti* or Hindi *languti*. In Suhtnga the people import cotton thread from Mynso and weave the (*ingki*) or sleeveless coat, peculiar to the district; these coats are dyed red and blue. The dark blue or black dye
824 is obtained from the leaf of a plant called *u sybu*, which
386 Mr. Rita has classified as *strobilanthus hoeditolius*, which
288 grows in the gardens round the homesteads. The leaves are dried, then reduced to powder, mixed with hot water, and the skeins of thread are steeped in the liquid. The colour is permanent. The red dye is obtained from the mixture of the dry bark of two shrubs, *ka lapyndong* (*symplocos racemosa*, Roxb.), and *ka 'larnong* (*morinda-tinctoria*, Roxb.), the latter being the same as the Assamese (আচুকাঠ) *áchukáth*. The bark is dried, then pounded, and the two sorts are mixed together and made into a paste with hot water. The skeins are steeped in this mixture for twenty-four hours, then taken out and divided, and again steeped for another twenty-four hours. The Lalungs and Bhois and Lynngams all weave cotton cloths, which are generally dyed blue, sometimes striped blue and red. The Wárs weave cotton cloths which are dyed red and yellow, the cloths being woven in checks. Mr. Darrah remarks that the cotton grown in the Jaintia Hills is said to be the best cotton produced in the province. Its thread can be more closely woven than that of other kinds. This statement, however, is not borne out by Mr. Allen writing in 1858, who says that the cotton is of inferior quality, the staple being short and woolly. The cotton cloths woven by the Bhois are called *spua*.

POTTERY.

[162] The Census Report of 1901 gave the number of persons who
323 are supported by the manufacture of pottery at 54 only. Pottery is manufactured at one place only in the Jaintia Hills,

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR

000 credited, owing, no doubt, to the advance of Christianity and education.

CEREMONIES AND CUSTOMS ATTENDING BIRTH AND NAMING OF CHILDREN.

844 The Khasi birth ceremonies and customs are as follows:—
[784] When a child is born the umbilical cord is cut by a sharp
782 splinter of bamboo; no knife can be used on this occasion. The Mundas of Chota Nagpur similarly taboo a metal instrument for this purpose. The child is then bathed in hot water from a red earthen pot. The placenta is carefully preserved in an earthen vessel in the house till after the naming ceremony has taken place. When the umbilical cord, after being tied, falls off, a puja is performed with eggs to certain water deities (*ka blei sam-um* and *ka niangriung*),* also to a forest spirit
553 (*u'suid bri* or *u'suid khláw*). The naming ceremony of the child
386 is performed the next morning after the birth. Certain females are invited to come and pound rice in a mortar into flour. The flour when ready is placed on a bamboo winnower (*u prah*). Fermented rice is mixed with water and is placed in a gourd. Some powdered turmeric is also provided, and is kept ready in a plantain leaf, also five pieces of *'kha piah*, or dried fish. The earthen pot containing the placenta is then placed in the *nongpei*, or centre room of the house. If the child is a male, they place near him a bow and three arrows (the implements of a Khasi warrior); if a female, a *da* and *u star*, or cane
553 head-strap for carrying burdens. An elderly man, who knows
782 how to perform the naming puja, which is called by the Khasis "*kaba jer khun*," places a plantain-leaf on the floor and sprinkles some water on it. He takes the gourd in his hand and calls a god to witness. The people assembled then mention a number of names for the child, and ask the man who is performing the puja to repeat them. This he does, and at the same time pours a little liquor from the gourd on to the ground. As he goes on pouring, the liquor by degrees becomes exhausted, and finally only a few drops remain. The name at the repeat-

* A spirit which is supposed to have the power of causing a disease of the navel of a child.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

ing of which the last drop of liquor remains adhering to the spout of the gourd is the name selected for the child. Then the puja performer invokes the god to grant good luck to the child. The father takes the pot containing the placenta, after having previously placed rice flour and fermented rice therein, and waves it three times over the child, and then walks out with it through the main entrance of the house and hangs up the pot to a tree outside the village. When he returns from this duty, before he re-enters the house, another throws water over the father's feet. The father, being thus cleansed, enters, and holds the rice flour to his mouth three times. Two people then, holding the dried fish by their two ends, break them in two. The powdered turmeric mixed with rice flour and water is applied to the right foot of the father, the mother and the child receiving the same treatment. The friends and relations are then anointed, the turmeric being applied, however, to their left feet. The bow, arrows, *da*, and *u star* are carefully placed inside the inner surface of the thatch on the roof, and the ceremony is over. Rice flour is then distributed to all who are present, and the male adults are given liquor to drink. After two or three months the ears of the child are bored and ear-rings are inserted. These ear-rings are called *ki shashkor iawbei* (i.e. the ear-rings of the great-grandmother). Mr. Jenkins mentions that the naming ceremony amongst the Syntengs is performed by the "eldest aunt," presumably on the mother's side. A basket of eggs is placed in the centre of the room, and before the ceremony begins one egg has to be broken. Then the aunt of the child takes two sticks, and, raising them to her shoulder, lets them fall to the ground. Before they fall she shouts, "What name do you give the child?" The name is mentioned, and if, on falling upon the ground, one stick crosses the other, it is a proof that the name has won the approval of the spirit. If the sticks do not fall in this position, another egg is broken and another name is chosen, and the sticks are dropped as before until they fall in the required position, when it is understood by the performers that the name is a good one. Mr. Jenkins was informed by a young man "who had renounced heathenism" that some of the more cunning women cross the sticks before lifting them, and that

553 782 [386] [302] 553 304 553 [104]

children, but Christian influence has eradicated or driven underground the consumption by women and children. **Industrial arts.** The only industrial arts traditionally practiced in all households were a rudimentary carpentry and a simple utilitarian basketry. Other arts were few, and were practiced as village specialties: the washing and smelting of iron ore and the forging of hoes, daos, knives, swords, and cooking pots (upland Khasis); the spinning of cotton thread (Mynso village, Jaintia); the dyeing of cotton thread and the weaving of cloth (Jaintias, Bhois, Lyngngams, Wars); the spinning and weaving of Eri silk (Khyrwang and Nongtung villages, Bhoi and Jaintia); and the hand manufacture, without wheel, of painted earthenware pots (Larnai village, Jaintia). Ironworking and the production of cotton goods have nearly died out through the competition of machine-made goods. Carpentry has greatly improved. An innovation of major importance is the sewing and tailoring, on sewing machines, of ready-made garments for both sexes. [Cf. Darrah 1896; C., W. 1832.] **Trade.** Khasi villages normally contain a number of household shops operated by women. Every Khasi also lives within walking distance of several village markets that are held on successive days of the eight-day week. The limits of market intercourse for the members of any particular village can be roughly distinguished by their naming the days of their week, which are called after the active markets. The exception is the huge market at Shillong, much of which is active daily, and which serves as a magnet for Khasis from all over the hills. The traditional barter has given way to currency in all markets. The small ones contain at least some local farm produce, plus other essentials like betel nut, and the food and tea stalls which serve as centers of social intercourse. The big markets contain not only regional produce and manufactures but also products from distant parts of the hills, brought for sale by traveling middlemen. There is also substantial trade, from the hills to the valleys, in potatoes, pears, hides, lac, cotton, caoutchouc, the wood of the sal tree, Eri silk thread, limestone, coal, ivory, bay leaf, betel nut, pan leaves, bananas, sugar cane, oranges, til, turmeric, and chilies. From the plains to the hills, there is trade in dried fish, paddy rice, salt, cooking oil, kerosene, matches, tea, sugar, wheat flour, machine-made cloth, shoes, metal pots, crockery, porcelain objects, coral beads, silver, and gold. Markets are important not only as economic institutions but also as centers for recreation (including archery competitions), courtship, reaffirmation of kinship ties with distant relatives, and the dissemination of information of all kinds. [Cf. Stegmiller 1924a.] **Division of labor.** Men do the heavy work, such as clearing and burning the swidden fields, caring for cattle and goats and driving them to market, butchering and selling large cuts of beef and pork, carpentry and mining, and driving and laboring on motor vehicles. They also tailor men's

411 of anything except iron or steel, the result being that the sword
314 is most awkward to hold, and could never have been of much use as a weapon of offence.

The same spear is used for thrusting and casting. The spear is not decorated with wool or hair like the spears of the Naga tribes, but it is nevertheless a serviceable weapon, and would be formidable in the hand of a resolute man at close quarters. The length of the spear is about 6½ feet. The shaft is generally of bamboo, although sometimes of ordinary wood. The spear heads are forged in the local smithies.

The Khasi weapon *par excellence* is the bow. Although no 'Robin Hoods," the Khasis are very fair archers, and they use the bow largely for hunting. The Khasi bow (*ka ryntieh*) is of bamboo, and is about 5 feet in height. The longest bow in use
[141] is said to be about the height of a man, the average height amongst the Khasis being about about 5 feet 2 inches to 5 feet 4 inches. The bowstring is of split bamboo, the bamboos that are used being *u spit*, *u shken*, and *u siej-lieh*.

The arrows (*ki khnam*) are of two kinds: (*a*) the barbed-headed (*ki pliang*), and (*b*) the plain-headed (*sop*). Both are made out of bamboo. The first kind is used for hunting,
[526] the latter for archery matches only. Archery may be styled the Khasi national game. A description of Khasi archery will be found under the heading "Games." The feathers
[825] of the following birds are used for arrows:—Vultures, geese, cranes, cormorants, and hornbills. Arrow-heads are made of iron or steel, and are forged locally. The distance a Khasi arrow will carry, shot from the ordinary bow by a man of medium strength, is 150 to 180 yards. The Khasi
[237] shield is circular in shape, of hide, and studded with brass or silver. In former days shields of rhinoceros hide are said to have been used, but nowadays buffalo skin is used. The shields would stop an arrow or turn aside a spear or sword thrust. The present-day shield is used merely for purposes of display.

389 Before the advent of the British into the hills the Khasis are said to have been acquainted with the art of manufacturing gunpowder, which was prepared in the neighbourhood of Mawsanram, Kynchi, and Cherra. The gunpowder used to be

manufactured of saltpetre, sulphur, and charcoal, the three ingredients being pounded together in a mortar. The Jaintia Rajas possessed cannon, two specimens of which are still to be seen at Jaintiapur. Their dimensions are as follows:—

Length, 9 feet; circumference in the middle, 3 feet 2 inches; diameter of the bore 3 inches. There are some old cannon also at Lyngkyrdem and at Kyndiar in the Khyrim State, of the same description as above. These cannon were captured from the Jaintia Raja by the Siem of Nongkrem. No specimens of the cannon ball used are unfortunately available. There are also small mortars, specimens of which are to be seen in the house of the Siem of Mylliem.

The weapons of the Syntengs are the same as those of the Khasis, although some of them are called by different names. At Nartiang I saw an old Khasi gun, which the people say was fired from the shoulder. I also saw a mortar of the same pattern as the one described amongst the Khasi weapons.

The Wár and Lynngam weapons are also the same, but with different names. The only weapons used by the Bhois (Mikirs) are the spear and bill-hook for cutting down jungle. Butler, writing of the Mikirs 1854, says, "Unlike any other hill tribes of whom we have any knowledge, the Mikirs seem devoid of anything approaching to a martial spirit. They are a quiet, industrious, race of cultivators, and the only weapons used by them are the spear and *da* hand-bill for cutting down jungle. It is said, after an attempt to revolt from the Assamese rule, they were made to forswear the use of arms, which is the cause of the present generation having no predilection for war."

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

reared either for food or as articles of trade. A pair of ploughing oxen are worth about Rs. 32, or £3, 4s.; an ordinary cow, Rs. 12, or £1, 4s.; a score of kids six months old, Rs. 16, or £1, 12s.; and a score of full-grown pigs, from Rs. 100 to Rs. 160, or from £10 to £16. 231 435

THE AGRICULTURAL IMPLEMENTS in use in the District consist of a plough, called *ka-jing-lúr* in Khásí, and a hoe or *kedálli*, called *u-imo-khiw*. When the cultivation is carried on by means of oxen, the plough is used, the hoe alone being used when the land is cultivated by manual labour. In the Khási Hills the use of the plough, except in a few rare cases, is entirely unknown; but in the Jáintiá Hills, oxen and ploughs are used to a greater extent. What is technically termed 'a plough' of land is equivalent to four English acres; a pair of oxen, together with the necessary implements, would represent a capital of about Rs. 40, or £4. 241 407 [435]

WAGES.—The Deputy-Commissioner reports that the price of labour in the District has more than doubled in the last ten years. The rates obtaining at present are from eightpence to one shilling a day for an ordinary labourer, and from one shilling to eighteenpence a day for a porter. An agricultural day-labourer earns sixpence, and a woman at the same work fourpence-halfpenny a day. Bricklayers, carpenters, and blacksmiths earn from a shilling to eighteenpence a day. The new Station of Shillong, the present seat of the Local Government, was established in May 1864, and since that date the demand for labour has markedly increased. The extension of the cultivation of potatoes has also had an appreciable effect on the price of labour. 178 464 465 [244]

PRICES OF FOOD GRAINS.—Of the different descriptions of rice in the markets of the District, the better sorts are imported from the neighbouring Districts of Sylhet and Kámrúp. The local produce is considered fit only for the use of the Khásiás. The price of the better descriptions depends entirely upon the distance from which the supplies come. In a distant market like that of Shillong, rice of the best quality generally sells at from 6 to 7 *sers* for the rupee, or from 16s. to 18s. 8d. per cwt.; and rice of inferior quality, which is only used by the poorer classes, at from 9 to 10 *sers* for the rupee, or from 11s. 2d. to 12s. 5d. per cwt. Little or no trade is carried on in unhusked grain. Paddy produced in the District generally sells at an average of from 15 to 16 *sers* per rupee, or from 7s. to 7s. 6d. per cwt. Indian corn, which is only grown to a small extent, is sold 435 439 243

Silver chains are worn by men as well as by women. The men wear them round the waist like a belt, and the women hang them round their necks, the chains being allowed to depend as low as the waist. Bracelets are worn by women; these are either of gold or of silver. The Lynngam males wear bead necklaces, the beads being sometimes of cornelian gathered from the beds of the local hill streams, and sometimes of glass obtained from the plains markets of Damra and Moiskhola. The cornelian necklaces are much prized by the Lynngams, and are called by them '*pieng blei*, or gods' necklaces. Like the Garos, the Lynngams wear as many brass earrings as possible, the lobes of the ears of the females being frequently greatly distended by their weight. These earrings are made out of brass wire obtained from the plains markets. The Lynngams wear silver armlets above the elbow and also on the wrists. It is only a man who has given a great feast who can wear silver armlets above the elbows. These armlets are taken off as a sign of mourning, but never on ordinary occasions. The Lynngams do not wear Khasi jewellery, but jewellery of a pattern to be seen in the Garo Hills. A distinctive feature of the Lynngam women is the very large number of blue bead necklaces they wear. They put on such a large number as to give them almost the appearance of wearing horse collars. These beads are obtained from the plains markets, and are of glass. Further detailed information regarding this subject can be obtained from Mr. Henniker's monograph, which contains a good plate illustrating the different articles of jewellery.

WEAPONS.

The weapons of the Khasis are swords, spears, bows and arrows, and a circular shield which was used formerly for purposes of defence. The swords are usually of wrought iron, occasionally of steel, and are forged in the local smithies. The Khasi sword is of considerable length, and possesses the peculiarity of not having a handle of different material from that which is used for the blade. In the Khasi sword the handle is never made of wood or bone, or

liGurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

411 of anything except iron or steel, the result being that the sword
314 is most awkward to hold, and could never have been of much use as a weapon of offence.

The same spear is used for thrusting and casting. The spear is not decorated with wool or hair like the spears of the Naga tribes, but it is nevertheless a serviceable weapon, and would be formidable in the hand of a resolute man at close quarters. The length of the spear is about 6½ feet. The shaft is generally of bamboo, although sometimes of ordinary wood. The spear heads are forged in the local smithies.

The Khasi weapon *par excellence* is the bow. Although no "Robin Hoods," the Khasis are very fair archers, and they use the bow largely for hunting. The Khasi bow (*ka synthiah*) is of bamboo, and is about 5 feet in height. The longest bow in use
[141] is said to be about the height of a man, the average height amongst the Khasis being about about 5 feet 2 inches to 5 feet 4 inches. The bowstring is of split bamboo, the bamboos that are used being *u spit*, *u shken*, and *u siej-lieh*.

The arrows (*ki khnam*) are of two kinds: (*a*) the barted-headed (*ki pliang*), and (*b*) the plain-headed (*sop*). Both are made out of bamboo. The first kind is used for hunting,
[826] the latter for archery matches only. Archery may be styled the Khasi national game. A description of Khasi archery will be found under the heading "Games." The feathers
[825] of the following birds are used for arrows:—Vultures, geese, cranes, cormorants, and hornbills. Arrow-heads are made of iron or steel, and are forged locally. The distance a Khasi arrow will carry, shot from the ordinary bow by a man of medium strength, is 150 to 180 yards. The Khasi
[237] shield is circular in shape, of hide, and studded with brass or silver. In former days shields of rhinoceros hide are said to have been used, but nowadays buffalo skin is used. The shields would stop an arrow or turn aside a spear or sword thrust. The present-day shield is used merely for purposes of display.

389 Before the advent of the British into the hills the Khasis are said to have been acquainted with the art of manufacturing gunpowder, which was prepared in the neighbourhood of Mawsanram, Kynchi, and Cherra. The gunpowder used to be

manufactured of saltpetre, sulphur, and charcoal, the three ingredients being pounded together in a mortar. The Jaintia Rajas possessed cannon, two specimens of which are still to be seen at Jaintiapur. Their dimensions are as follows:—

Length, 9 feet; circumference in the middle, 3 feet 2 inches; diameter of the bore 3 inches. There are some old cannon also at Lyngkyrdem and at Kyndiar in the Khyrim State, of the same description as above. These cannon were captured from the Jaintia Raja by the Siem of Nongkrem. No specimens of the cannon ball used are unfortunately available. There are also small mortars, specimens of which are to be seen in the house of the Siem of Mylliem.

The weapons of the Syntengs are the same as those of the Khasis, although some of them are called by different names. At Nartiang I saw an old Khasi gun, which the people say was [illegible] pattern as the one described amongst the Khasi weapons.

The Wár and Lyngam weapons are also the same, but with different names. The only weapons used by the Bhois (Mikirs) are the spear and bill-hook for cutting down jungle. Butler, writing of the Mikirs 1854, says, "Unlike any other hill tribes of whom we have any knowledge, the Mikirs seem devoid of anything approaching to a martial spirit. They are a quiet, industrious, race of cultivators, and the only weapons used by them are the spear and *da* hand-bill for cutting down jungle. It is said, after an attempt to revolt from the Assamese rule, they were made to forswear the use of arms, which is the cause of the present generation having no predilection for war."

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

about Rs. 30. The price of lac has risen a good deal of late years. Formerly the price was about Rs. 15 to Rs. 20 a maund. The lac trade in the Jaintia Hills and in the southern portion of the Khyrim State is a valuable one. The profits, however, go largely to middle-men, who in the Jaintia Hills are Syntengs from Jowai, who give out advances to the Bhoi cultivators on the condition that they will be repaid in lac. The Marwari merchants from the plains attend all the plains markets which are frequented by the hill-men, and buy up the lac and export it to Calcutta. The whole of the lac is of the kind known as stick lac.

HUNTING.

The weapons used by the Khasis for hunting are bows and arrows, the latter with barbed iron heads, and spears which are used both for casting and thrusting. Before proceeding on a hunting expedition the hunters break eggs, in order to ascertain whether they will be successful or not, and to which jungle they should proceed. Offerings are also made to certain village deities, *e.g. U. Ryngkew, u Basa*, and *u Basa ki mrád*. A lucky day having been selected and the deities propitiated, the hunters start with a number of dogs trained to the chase, the latter being held on leashes by a party of men called *ki nongai-ksew*. When the dogs have picked up the scent some hunters are placed as "stops" (*ki ktem*), at points of vantage in the jungle, and the drive commences with loud shouts from the hunters, the same being continued until the object of the chase breaks into the open. The man who draws the first blood is called *u nongsiat*, and the second man who scores a hit *u nongban*. These two men get larger shares of the flesh than the others. The *nongsiat* obtains the lower half of the body of the animal, thighs and feet excepted, called *ka tdong*, and the *nongban* one of the forequarters called *ka tabla*. The other hunters obtain a string of flesh each, and each hound gets a string of flesh to itself. These hunting parties pursue deer sometimes for many miles, and are indefatigable in the chase, the latter lasting occasionally more than one day. In the Jaintia Hills, at the end of the chase, the quarry is carried to

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

the house of the *nongpiat*, where a *puja* is performed to some local deity, before the flesh is distributed. At Shangpung, when a tiger or a mithan is killed, the head is cut off, and is carried in triumph to a hill in the neighbourhood where there is a *duwan*, or altar, at the foot of an oak tree (*diang ewing*). The head is displayed on the altar, and worship offered to *u 'lei lyngdoh*, the God of the doloinship.

The Khasis make use of an ingenious species of spring gun for killing game, the spring gun being laid alongside a deer path in the jungle. A string stretched across the path, when touched, releases a bolt and spring, which latter impels a bamboo arrow with great force across the path. This spring gun is called *ka riew siat*. A pit-fall, with bamboo spikes at the bottom, is called *u 'liw lep*, and a trap of the pattern of the ordinary leopard trap is called *ka riew slang*. A noose attached to a long rope laid in a deer run is named *riew syrwiah*.

There is also *ka riew pep*, the principle of which is that an animal is attracted by a bait to walk on to a platform; the platform sinks under the weight of the animal, and a bolt is released which brings down a heavy roof from above weighted with stones, which crush the animal to death.

There are several means employed in snaring birds; one of the most common is to smear pieces of bamboo with the gum of the jack-tree, the former being tied to the branches of some wild fruit tree, upon which, when the fruit is ripe, the birds light and are caught by the bird lime. This is called *ka riew thit*. Another is a kind of spring bow made of bamboo which is laid on the ground in marshy places, such as are frequented by snipe and woodcock. This form of snare is unfortunately most common. A third is a cage into which birds are lured by means of a bait, the cage being hidden in the grass, and the entrance being so contrived that the birds can hop in but not out again. This is called *ka riew sin*.

FISHING.

Although there are some Khasis who fish with rod and line, it may be said that the national method of fishing is to poison

1:Gordon E-4, 5 (no date) 1907 AR? Khasi AR?

[Gil] 126 challenge. From the records available of the military operations of the Khasis against the British, the former appear to have relied principally on bows and arrows, sickles and surpins, when they fought against us at the time of our first occupation of the hills. During the Jaintia rebellion firearms were used, to some extent, by the Syntengs. The military records do not, however, disclose any peculiar battle customs as having been prevalent amongst these hill people then. Both Khasis and Syntengs seem to have fought much in the same manner as other savage hill-men have fought against a foe armed with superior weapons.

SUPERSTITIONS.

The Tiblu Superstition.

325 782 773 774 There is a superstition among the Khasis concerning a *tiblu*, a gigantic snake which requires to be appeased by the sacrifice of human victims, and for whose sake murders have even in fairly recent times been committed. The following account, the substance of which appeared in the *Assam Gazette*, in August, 1882, but to which considerable additions have been made, will illustrate this interesting superstition:—"The tradition is that there was once in a cave near Cherrapunji,* a gigantic snake, or *tiblu*, who committed great havoc among men and animals. At last one man, bolder than his fellows, took with him a herd of goats, and sat himself down by the cave, and allowed them one by one to the *tiblu*. By degrees the monster became friendly, and learnt to open his mouth at a word from the man, to receive the lump of flesh which was then thrown in. When confidence was thoroughly established, the man, acting under the advice of a god called U *Bard-sah*,† (who has as his abode a grove near Sohwong),

* This cave is at Pomblai, some five miles east of Cherrapunji, close to a great waterfall called *Jub Ko Liber*, i.e. the place where Ko Liber jumped down the precipice (for a full account of this story see footnote U of the monography), where there is a large block of stone, with some rude cave in it, known as *Dawn Thlaw*, i.e. the snake resting place.

† In another account it is said to have been U Bard-sah himself who fed the

[illegible]

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

This stone is apparently some rough gem which may be picked up by the Lyngams in the river beds. A rich man amongst them, however, is one who possesses a number of metal gongs, which they call *wiang*. For these they pay very high prices, Rs. 100 being quite a moderate sum for one of them. Being curious to see one of these gongs, I asked a *sirdar*, or head-man, to show me one. He replied that he would do so, but it would take time, as he always buried his gongs in the jungle for fear of thieves. Next morning he brought me a gong of bell metal, with carvings of animals engraved thereon. The gong when struck gave out a rich deep note like that of Burmese or Thibetan gongs. These gongs have a regular currency in this part of the hills, and represent to the Lyngams "Bank of England" notes. It would be interesting to try to ascertain what is their history, for no one in the Lyngam country makes them in these days. Is it possible that the Garos brought them with them when they migrated from Thibet? The gongs are well known in the Garo Hills, and I hear that when a *nokma*, or head-man, there dies his corpse is laid out upon them. They thus possess also an element of sanctity, besides being valuable for what they will fetch to the Garos or Lyngams. We may hope to hear more about them in Captain Playfair's account of the Garos.

The Lyngams do not tattoo. Their weapons are the large-headed Garo spear, the dao, and the shield. They do not usually carry bows and arrows, although there are some who possess them. They are by occupation cultivators. They sow two kinds of hill rice, red and white, on the hill-sides. They have no wet paddy cultivation, and they do not cultivate in terraces like the Nagas. They burn the jungle about February, after cutting down some of the trees and clearing away some of the debris, and then sow the paddy broadcast, without cultivating the ground in any way. They also cultivate millet and Johnson in the same way. With the paddy *thillim* are sown the tree yam. The egg plant, arum, ginger, turmeric, and sweet potatoes of several varieties are grown by them in a similar manner. Those that rear the lac insect plant *bandar* tree (Hindi *ankol dol*) in the forest clearings, and rear the insect thereon. Some of these people, however, are prohibited by a

Arrow Shooting and Hunting Customs of the Khas
by P.F. Stegmiller, S.D.S., Apostolic Missio
of Assam.

• 411

1. Arrow Shooting and Its Implements.

Corresponding to the general interest which is shown in arrow shooting, the tools that belong to this art are prepared with great skill and ability, (1) namely the bow, the arrow, and

1. Hermann Meyer, Pfeil und Bogen in Zentralbrasilien, (Leipzig, 1895), p. 16. [Bows and Arrows in Centra Brazil].

the target.

411 922 A kind of bamboo with many knots is used for the Khasi bow (ka rynthieh), and it is cut out in one piece so that there are at least five knots on the bow. The length of the bow is about 1.5 meters. It is not a matter of indifference how long the bow is. The best shots claim that the bow must be made to measure and must be made shoulder height. The size of the man determines the size of the bow. (2)

2. Bruno Adler, Internationales Archiv für Ethnographie, [International Archive for Ethnography] Vol. 14, Supplement: "Der nordasiatische Pfeil", [The North Asian Arrow], p. 14: "The long arrow of the Japanese corresponds to the longest bow which we find in Asia-phenomena which are in the grosse contrast to the small figure of the Japanese."

Fig. I

When a strong bamboo with many knots is found, it is cut off and split after the length has been determined. The outside of the bow in smaller bows is rounded off; (3) 411 322

3. Illustration I, fig. 1c.

for the usual bows and the larger ones almost the full half of the bamboo is taken. A little is cut off only on the sides so that the profile of the bow nearly forms a right angle. (4) In each case the shiny

4. Illustration I, figs. 2,3,4c.

outer side of the bamboo becomes the inside of the bow. The bow becomes smaller towards the ends. The ends are rounded off. Underneath one end, about 3 centimeters from the end, a notch is made, into which the string is put directly without any other means of fastening. The string remains fastened by pulling the loop taut. At the other end of the bow a peg is cut, around which the string is hung just before the bow is used. Often both ends of the bow end in a point. (5)

5. Illustration I, fig. 1, 2b.

The bow must not be kept strung but must be unstrung when left unused for a while. Stringing the bow is always done in this way. The archer takes the bow in his left hand while standing, resting on the ground the end to which the string always remains attached, and then pressing down the other end with his right hand as far as is necessary to hang the loop of the string around 411 284

411 284 the peg. In many cases with bows with the points indented the string is attached by means of a special loop of bast or split bamboo (u thri), but it is also fastened directly by hanging around the peg. [608] [Illustration I. Khasi Bows. 1a, 1b, 1c, 2a, 2b, 2c, 3a, 3b, 3c, 3d, 3e, 4a, 4b, 4c]. [609] The bow is carved flat in the middle and a strip of reed palm is wound around it so that there is a band 12 to 15 centimeters wide around it. The purpose of this is to provide a surer grip, as the left hand, which carries the bow when shooting, gets a better grip on the ribbed foundation. In other places also, primarily at the ends of the bow, such reed strips are fastened and merely serve the purpose of ornamentation.

411 322 When the bow is completed, it is thoroughly smoked. The smoking takes place in the hut. In the center of the hut a fire burns constantly in a hearth of earth or of stone, the smoke of which, since there is no vent or chimney, seeks a way out the best it can. Above the fire a swing is set up from the ceiling on which the wood lies for drying. The bow and also the string are left lying on this swing until the desired result occurs. Smoked bows are more resistant to dampness, longer lasting, and considerably tougher. The smoking has no effect on the flexibility of the bow. (6)

411 284

o. Ethongraphic Museum Munich: Bows As, 108, a, b, c, have 3 knots; bow As, 28, has 4 knots; bow J has 3 knots; bow S has 5 knots; bows As, 108, a, b, c, have a length of 119.5 centimeters; bow As, 28 has a length of 144 centimeters; bow J has a

411
284

length of 141 centimeters; bow S has a length of 156 centimeters; bows As, a, b, c, have a breadth of 22 millimeters in the middle, and 17 millimeters at the ends; bow As, 28, has a breadth of 27 millimeters in the middle and 18 millimeters at the ends; bow J has a breadth of 25 millimeters in the middle, and 12 to 16 millimeters at the ends; bow S has a breadth of 32 millimeters in the middle, and 12 to 18 millimeters at the ends; bow S gets smaller and smaller at an even rate towards the end to which the string is attached just before the bow is shot, while it gets too high at the other end. Height of the bow in the middle is 15 millimeters, at one end 12 millimeters, at the other 17 millimeters; bow J gets smaller and smaller at an even rate towards the end where the string is attached just before the bow is shot, while at the other end it becomes too round. Height in the middle 15 millimeters, at one end 12 millimeters (in the breadth), at the other end 12 millimeters (about on the average). None of the bows has either a wrapped handgrip nor any other ornamentation.

411
283

For making the string (u ksai) the Khasi split a bamboo and split a strip of it off which they smoke thoroughly. The string is uniform for bows with a circular notch; for bows with tapered points, it becomes thicker towards the ends, on which braces are cut from the bamboo knots made from one piece with the string. The kinds of bamboo used for the strings are called u spit, u skhen and u siej-lieh by the Khasi. Bast string, twisted many times, is also used for the string. The bamboo strings are smoked (see above).[1] The strings obtained thus are extremely strong and can stand great tension. With a bow of 150 centimeters the height of the arc, i.e., the span of a strung bow amounts to 10 to 12 centimeters. Often, however, the string is almost the length of the bow and no arc results. When shooting the arc is increased by tightening the string to 60 centimeters. Thus the bow is a powerful, mighty [610] sling, which sends off the arrow without any mechanism other than pulling back the string and moving back the bent bamboo. (7)

411
284

7. Bow As, 108, b, has a bamboo string with 5 knots, the shiny side facing inward. The string is 4 millimeters wide in the middle and 7 millimeters wide at the ends. At each end there is a brace cut out of a piece with the string. The string is fastened to the indented tips by means of a threefold bamboo lace (u thri). The string and the bamboo lace are fastened by a strip of bamboo 3 millimeters wide. Illustration I, fig. 1a, height of the arc 9 centimeters,

1 [See category 116, p. 4--Analyst]

weight of the bow 190 grams. Bows 108, a, b, c, can scarcely have been used for sport, more probably they are children's bows, unless they were made deliberately for selling to Europeans. Bows As, 28, has a bamboo string with five knots, 3 millimeters wide in the middle and 8 millimeters wide at the ends and at both ends there are braces made out of a piece with the string. The outer shiny side of the bamboo string that is turned inward is scraped off with the exception of the ends of the string. There it is split and bent back as a covering for the brace. The string is fastened on both sides of the indented tips by means of a double bast lace. Both are held together with wire. Illustration I, fig. 2a, height of the arc 8 centimeters, weight of the bow 330 grams. Bow J has a bamboo string with two knots, 3 millimeters wide throughout without a brace. It is fastered at the pegs by hanging directly. Weight of the bow 330 grams. Illustration I, fig. 4a, 4b. Bow S has a threefold string of bast. This bast string is hung around the notch and the peg (inderted tip) like a loop. The knots that tie the loop are 30 centimeters and 19 centimeters respectively from the ends. Weight of the bow is 449 grams. Illustration I, figs. 3a, 3b, 3c, 3d. Both of the bows mentioned last have no

411
284

411
284

arc height since the strings are as long as the bows.

411
526

The Khasi make the followings kinds of arrows:

1. Feathered arrows ('nam-pur).
2. Unfeathered arrows ('nam).

Feathered or unfeathered ones are: a) hunting arrows, b) arrows for sport. Always feathered are c) children's arrows.

Ad a) Hunting arrows (u 'nam-pliang) are about 70 centimeters long, and have tips like a spear with barbs. (8) The weight of the hunting

8. Illustration II, figs. 2a, 2b.

arrows is about 25 grams. These arrows are still poisoned nowadays.

Ad b) Arrows for sport (u 'nam-sop) are about 60 centimeters long and have round, conical iron tips. (9) Weight of the arrow for

9. Illustration II, fig. 1.

sport is about 8 grams.

Ad c) Children's arrows (u 'nam-phiah) are about 50 centimeters long, and have round points or none at all. The feathering is different from that of the other arrows (cf. the latter).

411

Shafts of the Arrows

All the arrows are made of a very thin bamboo (u 'nam-long or igrâ) and smoked. When possible bamboo free of knots is used. The arrow is about 6 to 7 millimeters thick. The length of the arrow varies greatly. For the arrow and the bow must complement each other inwardly just as they belong together externally. (10)

611

10. Dr. R. Karutz, Die afrikanischen Bogen, Pfeile und Köcher im Lübecker Museum für Völkerkunde /African Bows, Arrows and Quivers in the Lübeck Ethnological Museum/ (Lübeck, 1900) p. 219.

There is no doubt that the length of the arrow depends on the length of the bow. A large, but less flexible bow does not need so long /611/ /Illustration II. Khasi Arrows. Figs. 1, 2a, 2b, 3a, 3b, 4, 5a, 5b, 6a, 6b, 7a, 7b, 8a, 8b./ /612/ an arrow as a smaller more flexible one. The absolute length of the bow conditions the length of the arrow to the extent that usually a longer bow requires a longer arrow. (11) Arrows for sport will [526]

11. Bruno Adler, op. cit. p. 13.

float horizontally on water. (12)

12. "Weniaminoff relates (Sapiski ob ostrowan Unalaschkinskago otdjela /Notes on the Island of the Unalaska Territory/, Vol. 2, St. Petersburg, 1840) of the Aleutians that the tips of their arrows, especially the ones used in hunting beaver, have such a weight distribution that the arrow does not sink in the water in spite of the heavy shaft nor does it lie on the water, but floats upright, so that a piece almost a foot long sticks up above the surface of the water."

Arrow Tips

411
326 The arrow tips are made of iron in the village smithies. The tips of the hunting arrows ('nam-pliang) are flat, raised a little towards the middle and have smooth or toothed edges and two or more barbs (shaped like a spear). Length of the tip is about 9 to 15 [531] centimeters. Beautiful wrought iron arrow tips with pierced designs are also made. (13)

13. Illustration II, figs. 3a, 3b.

[526] The tips of the arrows used for sport ('nam-sop) are round and conical. Length is about 3 to 6 centimeters.

The spear-shaped arrow tips are poisoned with (ka bih) poison which the Khasi obtain from the tuber or a plant (aconitum ferox Wallich, aconite).

Attaching the Arrow Tips.

411 The arrow tips are attached in two ways:

1. either the shaft of the arrow is pointed in front and the arrow tip, which is hollow inside, is placed on it-both are joined with sealing wax;

2. or there is a separate shell of copper which connects the arrow tip with the shaft. Sealing wax is not used, since the shell acts as a clamp. Length of the shell is about 1.5 centimeters.

The Notch of the Arrow

At the tip of the opposite end a notch is cut in every arrow. The arrow is taken from a whole 'nam-long or igrâ (kind of bamboo) in

such a way that the notch can be cut directly after a knot. The purpose of the notch is to be able to set the arrow easily on the string. There are two kinds of notches: 411

1. Notches which resemble the curve of a Moorish bow. (14)

14. Illustration II, figs. 5a, 5b.

2. Notches which have an even flatness at the bottom and a point on the left and the right. (15)

15. Illustration II, figs. 6a, 6b.

Relationship of the Cut Surface to the Notch.

The large spear-shaped tips of the hunting arrows ('nam-pliang) are made with the wide flat part at right angles to the notch and thus to the string of the bow. (16)

16. Bruno Adler, op. cit., p. 607.

Markings on the Arrows.

[613] Many arrows (arrows for sport 'nam-sop) are marked with black lacquer from the end of the base of the feathering to the notch, so that the arrows of the teams can be told apart in shooting competitions. (17) [526]

17. Illustration II, fig. 8a.

Feathering the Arrows

411
237

The Khasi have two ways of feathering:
1. Radial sewn feathering.
2. Tangential tied feathering.

411 237 Ad 1. Radial sewn feathering is the common method. Feathers are taken from geese, cranes, cormorants, Buluwar vultures and the horn bird. The feathers of the carrion vultures are used less often as they are brittle. The feathers are split along the quill (shaft), cut on the top and on the bottom and sewn onto the base. At one end the feathers are 4 millimeters wide, on the other end (towards the notch) 8 millimeters wide. The split quill is 5 centimeters, the outer flags of the feathers 7 to 8 centimeters.

411 237 531 The base consists of tinfoil and is divided variously. A strip of tinfoil (not colored) alternates with a strip of tinfoil colored red. Thus the bases have a red tinfoil strip in the middle and two red ones at each end. Or there are three in the middle and at the ends two or three red strips of tinfoil. The space in between is filled out with uncolored tinfoil (silver). The red strips of tinfoil are two millimeters wide. (18)

18. Illustration II, fig. 8a.

There are also bases of leather which is cut very fine and gilded. As in the examples just mentioned red strips of tinfoil alternate with the base that is not colored; similarly, uncolored strips of leather alternate with the gilded base. The uncolored strips of leather are 7 millimeters wide. (19)

19. Illustration II, fig. 7a.

The feathers which have been cut properly are now sewn onto the bases with uncolored natural silk, in a spiral form, (20), although

20. Illustration II, fig. 4

lightly. The stitches are made exactly and evenly throughout. Figures 7b and 8b of illustration II, though greatly enlarged show how the silken threads are put on. With a base 5 centimeters long the number of stitches is 22 to 24, with bases of 7.5 the number of stitches is 29 to 31. 411 237 531

The feathers are at right angles to the split quill on the shaft and are sewn on five together, more rarely three together.

On the underside of the base (towards the tip of the arrow) black colored pitch is smeared, to unite the cut off feather ends to the shaft of the arrow. (21)

21. Illustration II, figs. 7a, 8a.

[614] Ad. 2. Tied tangential feathering is only used still on children's arrows ('nam-phiah). A completely uncut feather is fastened lengthwise on the end of the arrow by silk or bast and the join is smeared with pitch. 411 237

Hunting arrows and arrows for sport are also used unfeathered (hunting arrows especially in the neighborhood of Lamin) and are then simply called 'nam, but if they are feathered they are called 'nam-pur. 411 526

The target is made of the soft wood of a root and is called ka soh pdung by the Khasi. A piece of wood about 8 to 10 centimeters wide and 50 centimeters long is cut from the root, smoothed on the front side and pointed somewhat towards the ground, so that the whole thing resembles a relatively wide but short lath. This target is set up by putting the somewhat pointed end into the earth and placing two bamboo sticks behind as braces, so that the target cannot be tipped

411 over backwards by th impact of the arrows.
526 Bunches of grass of straw, u skum, are taken and fastened to a pole. The distance between the shooters and the target is quite varied, 50 to 100 meters being the usual distance. The Khasi bows can shoot an arrow a great distance with accuracy. Good shots hit the target even at a distance of 200 meters. The average shot can stand at a distance of 150 to 170 meters. Consideration is taken of younger archers, but if the distance has been established, it must be very carefully adhered to. A string is stretched along the ground which indicates exactly where the shooter must stand.

411

Ways of Bending the Bow

It takes a lot of practice and especially a great deal of strength to hit a definite mark. The archer usually gets down on his right knee and grasps the bow, with his left arm stretched out, somewhat below the middle of the ribbed band and braces his thumb against the bow. He places the arrow with his right hand. The arrows shoot out on the left side of the bow. Some release the arrow between the middle finger and the index finger which is held somewhat bent. The right hand braces the end of the arrow in the notch on the string and holds it firm with the thumb and bent index finger. With the head bent a little to the left and aiming with the right eye, string and arrow are pulled at the same time and after the bow has been pulled to the correct tension, the arrow is released. (22) Only the best shots

22. Hans von Stüssi, Mit Pfeil und Bogen (With Bow and Arrow).

411

achieve calm aiming and a calm posture.

Another method of bending the bow is also used a great deal. The archer takes the arrow in his right hand, places it to the left on the bow and pulls the string with his middle finger and ring finger while his thumb and index finger hold the arrow. [614a] [Table I, Khasi at an Archery Contest] [614b] Table II. Khasi at an Archery Contest]

[615] The Quiver

The quiver (ka ryngkap) is made of plaited bamboo which is covered on the outside with a very finely plaited cover of reed palm. Its shape resembles a closed umbrella. At the opening the plaited work is raised in front in the shape of an arc, and in the back it is raised in a more rounded form. On each side where the quiver curves down and around a stick is attached. Quivers are not used for shooting or hunting. The Khasi carry their arrows in their hands then. The use of quivers is restricted to dances and even this is very rare. (23) [615]

23. Ethnographic Museum, Munich, Quiver As, 106, is 57 centimeters long and 9 centimeters wide at the opening. The plaited part in front is 40 centimeters high behind 38 centimeters, and on the sides where it curves in 33.5 centimeters. The very finely plaited reed palm has 16 smooth inlays at distances of 1.3 to

411

2 centimeters. On the two sticks on each of the same sides is a bamboo strip covered around with palm reed which is tied with palm reed at intervals of 3 to 5 centimeters. Weight of the quiver 220 grams.

2. Archery Contests

526 Arrows are shot on every big market day which occurs every eight days. The men and youths of a village gather together, go to the place chosen for the contest and practise industriously, because everyone wants to win in the big contest. These usually take place from January to May. Large factions develop then: village against village. The number of participants must be equally large. Each faction has its own shooting place with its own target, each next to one another. The archers by tens are placed in a line and are the same distance from the target as the string stretched on the ground indicates. Each receives three arrows for a round. The watchers and the judges are placed near the target at right angles to the archers. Both factions name their judges themselves. The latter select a fortunate day by egg throwing; (24) they choose the

24. Becker, "Das Eierwerfen der Khasi", /Egg Throwing Among the Khasi/ Anthropos, 1917-1918, pp. 494 ff.

place of the contest as well as the number of participants and the arrows to be shot. They also measure the exact distance from the target, place the string on the ground, examine the

533 S. : "Thou fledst into the thicket! Did that help thee?
Shyly thou retreated before the brave crowd of hunters!"
All: "Ha, ha, ho, huh!"
S. : "Quickly indeed thou retreated; quickly the pursuers pressed after thee and arrow and bow brought thee low!"
All: "Ha, ha, ho, huh!"
S. : "O mistress! Why didst thou come hither? Thou gavest thyself over to death and destruction — but we rejoice and celebrate and exult!"

Thus it continues for a long time. When one person has sung until he is hoarse, another takes his place and continues the song.

224 Exhausted from the exertions of the hunt, exhausted from the activity of the parade home, hoarse from shouting and screaming, heated from the enjoyment of brandy, the crowd drags itself to the house of the hunter who placed the first arrow or shot in the wild animal. Sacrifice is made there to the village god and the slain animal is divided up. The first shooter (u nongsiat) receives the hind quarters, the second shooter (u nongban) the front quarters of the animal.

In the Jaintia Hills the Synteng go to a hill in the neighborhood of the village when they have hunted and killed a tiger or a leopard. An altar is set up there under an oak tree and the head of the animal, which has been severed from its body, is placed on it and sacrificed to the u'lei lyngdoh (the god of the Dolloi district).

782

Arrow and bow are not only necessary weapons to the Khasi for hunting or pleasant sporting equipment for archery contests; Arrow and bow are also holy to him in a certain-

sense. For a his entrance into life and at his departure from it both are used in the religious ceremonies. If a boy is born, a bow and three arrows are placed beside him at the name giving. (35) After various ceremonies,

35. F.F. Stegmiller, "Aus dem religiösen Leben der Shoel" (The Religious Life of the Shoel), Anthropos, 1921-1922, pp. 425 ff.

which cannot be described here, the sacrificer shows the boy the bow and three arrows, and calls upon him to become a good shooter. At the end of all the ceremonies the bow and the arrows are carefully attached to the inside of the straw roof of the hut.

It should be mentioned that at a Shoel cremation (36) a bow and three arrows are also

36. F.F. Stegmiller, loc. cit., p. 430 ff.

used. They are kept in readiness with the other ceremonial objects of the dead, while the corpse is being shown for the last time to the participants in the funeral. As soon as the fire flames up on the funeral pyre, three arrows are also shot off: one towards the north, one towards the south, and the third towards the east. The Shoel call these arrows 'sun-tipped.

Quarrels and fights are exceptional. It is most natural to the Ehsei not to disturb the peace of the markets, since the markets stand under the protection of the goddess. (Cf. The prayer in the introduction to this article.)[5] Also the memorial stones, in the shadow of which the markets are so often held, may exert some influence on the visitors to the markets, since the Ehsei imagine themselves to be protected by the spirits of their ancestors and believe that any kind of disorder at the market would be avenged by these spirits.

Nearly all the men at the market are armed. The reason for this lies in the fact that the people are thus protected on the way to the market and are safe from the attacks of the "killers" (nongetonoun), i.e., those who get out to murder people in order to dedicate their victims to the devil snake. Therefore the visitors to the market never go alone but always in groups. The men are armed with the ko wait (a chopping knife), with which they know how to defend themselves very well.

4. The Law of the Market

a) The Market Toll. All sellers who attend the market must pay a contribution on entering the market place. Only those inhabitants of the village or district in which the market is held are exempted. This market tax is paid partly in money and partly in products. In many villages it is paid only in cash. The amount of the tax laid is 2 or 3 paises, often even one anna (3--6--10 pfennigs, German peace evaluation). Only betel nuts and pepper leaves are preferred to money. In many villages everything is paid in produce, insofar as foodstuffs are concerned. The market tax collector reaches

[See category 12, pp 12--Amulet]

Sr Gordon G-3 (no date) 1904 AR7 Khasi AR7

241 small bib), and a cap which is peaked in front and which comes down well over the ears, called (in *ropin ekor*) *ear cap*. The dress of the Khasi females is somewhat different from that of the Syntengs, the former wears a striped cloth tied round the waist, hanging down to the knees, and another cloth, with a fringed border, knotted on both the shoulders to cover the bust and a narrow cloth, called *ka jymphen*, to serve the purpose of under-clothing. A cloth knotted in front is also worn like a cloak over shoulders. The Syntengs women wears a cloth manufactured round the body fastened above the bust and drooping down to the ankles. Another cloth is thrown over the shoulders, and crossed in front. Both Khasi and Syntengs women wear a cloth tied over the head, called *ka tap mukhlieh*. Upto-date Khasi males wear hunting-boots, stockings, and boots, and hunting chemises. On festive occasions, both Khasis and Syntengs, males and females, wear expensive silks, with earrings of gold or silver. There is a special dancing-dress of elaborate pattern. The women at festivals wear a circlet of silver with a spear-head ornament behind, rising 4 or 5 inches from the back of the head. Large coral beads are much valued, and necklaces of alternate beads of coral and gold, and sometimes of coral alone, are worn by the chiefs and their principal followers. Such necklaces are worn by women also on gala occasions. The staple dish of both Khasis and Syntengs is rice and dried fish. They are, however, fond of all kinds of meat, especially pork. Some of the Syntengs abstain from beef, owing no doubt to Hindu influences. Neither Khasis nor Syntengs eat dog, which is partaken of with zest by the Naga and the Garo tribes,—this is owing to the dog being considered by the Khasis to be the friend of man. Neither Khasis nor Syntengs use milk, the latter being thought by them to be an excrement. Neither Khasis nor Syntengs tattoo. The weapons of both Khasis and Syntengs are bows and arrows, swords and shields. The national game of the Khasis is archery, regarding which a detailed description will be found in paragraph 11.

The people live in regular villages on fixed sites which have not changed for generations,—often long enough for the sacred monoliths to become [illegible] sites, where, as a rule, the family tombs are standing. The houses are built in the shape of a shell, the houses being divided into three compartments,—the *Shyngiap*, or porch, where cattle and carts, and sometimes fowls, are kept; *nongpi*, or centre room, which is used for cooking and sitting in; and *nongpi*, or inner room, where the people sleep. The houses are low, with great roofs reaching nearly to the ground, the houses are of hewn timber, the walls are of either planks roughly hewn or of reeds or split bamboos plastered with clay. The Khasis' houses generally have boarded floors raised some feet from the ground level,

29: Hunter G-4 (no date) 1897 AR7 Khasi AR7

burning the *dewl* in the immediate neighbourhood of the village of Jowai. Suspicions of insurrection arose during the months of October and November 1860. In the beginning of January 1861 alarming reports were received from various quarters, and the first serious outbreak occurred on the 17th of that month. This was occasioned by the interference of a *dewgoi*, or native police official, with a religious ceremony then took place at the village of Jaiaing. In such ceremonies dancing with arms is held essential; and the *dewgoi* took upon himself to disarm the dancers. This was the signal for a general rising. The *thiad* or police station at Jowai was burned to the ground; the garrison of sepoys was besieged, and all show of British authority was swept away throughout the Hills. The Syenngs fought bravely for their independence, and at first were successful in cutting off several small detachments of police and sepoys. Their weapons were bows and arrows. In common with the other hill tribes of the North-East Frontier, their chief defence consisted in a series of strong stockades, one behind another; and the paths leading to their villages were thickly planted with *punjis*, or little bamboo spikes, stuck in the ground like caltrops. The battalion of sepoys stationed in the Hills was rendered ineffective by sickness. At last it was found necessary to move a regular army, including an elephant battery and two regiments of Sikhs, into the country in order to quell the revolt. Colonel Dunsford was in chief command. He was accompanied by Major Haughton, the Governor-General's Agent on the North-East Frontier, and Captain Morton, the Deputy-Commissioner of the Khasi and Jaintia Hills, who acted in a political capacity. The operations were serious and harassing. The rebel chiefs were captured one by one, and the District was declared to be finally pacified in March 1861, after the rebellion had lasted for three months. The special Commission appointed under Act xi. of 1861, for the trial of [illegible] The causes of the rebellion were thus summed up by Major Haughton in an official despatch to the Government of Bengal:—"Taxation was introduced without the supervision with which such a measure should have been accompanied. It was followed up by fresh taxation and removal of other taxes, also by fiscal and other measures, which tended to disturb the minds of the people, without any counterpoise such as might have resulted from the continued presence of a European officer." The Syenngs, like the

175 648 175 648 726 [625] [796] [535] [625] [911] [712] 175 648 727 175 648 651 175 648

impossible to state, as it is to fix upon the exact tract of country from which the Aryans sprang. With reference to the Khasi branch of the Mon-Anam family, it would seem reasonable to suppose that if they are not the autochthons of a portion of the hills on the southern bank of the Brahmaputra, and if they migrated to Assam from some other country, it is not unlikely that they followed the direction of the different irruptions of foreign peoples into Assam of which we have authentic data, i.e. from south-east to north-west, as was the case with the Ahom invaders of Assam who invaded Assam from their settlements in the Shan States *viâ* the Patkoi range, the different Burmese invasions, the movements of the Khamtis and, again, the Singphos, from the country to the east of the Hukong Valley. Whether the first cousins of the Khasis, the Moas, moved to their present abode from China, whether they are the aborigines of the portion of Burma they at present occupy, or were one of the races "of Turanian origin" who, as Forbes thinks, originally occupied the valley of the Ganges before the Aryan invasion, must be left to others more qualified than myself to determine. Further, it is difficult to clear up the mystery of the survival, in an isolated position, of people like the Ho-Mundas, whose language and certain customs exhibit points of similarity with those of the Khasis, in close proximity to the Dravidian tribes and at a great distance from the Khasis, there being no people who exhibit similar characteristics inhabiting countries situated in between; but we can, I think, reasonably suppose that the Khasis are an offshoot of the Mon people of Further India in the light of the historical fact I have quoted, i.e. that the movements of races into Assam have usually, although not invariably, taken place from the east, and not from the west. The tendency for outside people to move into Assam from the east still continues.

APPENDIX.

The late Mr. S. E. Peal, F.R.G.S., in an interesting and suggestive paper published in the *Journal of the Asiatic Society of Bengal* in 1896, drew attention to certain illustrations of

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

[114] 982 191 144

"singular shoulder-headed celts," found only in the Malay Peninsula till the year 1875, when they were also discovered in Chota Nagpur, and figured in the Journal of the Asiatic Society of Bengal for June of that year. These "celts" are, as the name implies, ancient stone implements. Mr. Peal goes on to state the interesting fact that when he was at Ledo and Tikak, Naga villages, east of Makum, on the south-east frontier of the Lakhimpur district of Assam, in 1895, he found iron implements, miniature hoes, used by the Nagas, of a similar shape to the "shoulder-headed celts" which had been found in the Malay Peninsula and Chota Nagpur. Now the peculiarly shaped Khasi hoe or *so-ddiw*, a sketch of which is given, with its far projecting shoulders, is merely an enlarged edition of the Naga hoe described by Peal, and may therefore be regarded as a modern representative in iron, although on an enlarged scale, of the "shoulder-headed celts." Another interesting point is that, according to Forbes, the Burmese name for these stone celts is *so-gyo*. Now the Khasi name for the hoe is *so-ddiw*. The similarity between the two words seems very strong. Forbes says the name *so-gyo* in Burmese means "cloud or sky chain," which he interprets "thunderbolt," the popular belief there, as in other countries, being that these palæolithic implements fell from heaven. Although the Khasi name *so-ddiw* has no connection whatsoever with aerolites, it is a singular coincidence that the name for the Khasi hoe of the present day should almost exactly correspond with the Burmese name for the palæolithic implement found in Burma and the Malay Peninsula, and when it is remembered that these stone celts are of a different shape from that of the stone implements which have been found in India (with the exception of Chota Nagpur), there would seem to be some grounds for believing that the

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Khasis are connected with people who inhabited the Malay Peninsula and Chota Nagpur at the time of the Stone Age.* That these people were what Logan calls the Mon-Anam, may possibly be the case. Mr. Peal goes on to state, "the discovery is interesting for other reasons, it possibly amounts to a demonstration that Logan (who it is believed was the first to draw attention to the points of resemblance between the languages of the Mon-Anam or Mon-Khmèr and those of the Mundas and the Khasis), was correct in assuming that at one time the Mon-Anam races and influence extended from the Vindyas all over the Ganges Basin, even over Assam, the northern border of the Ultra Indian Peninsula." Mr. Peal then remarks that the Eastern Nagas of the Tirap, Namstik, and Sonkap group "are strikingly like them (i.e. the Mon-Anam races), in many respects, the women being particularly robust, with pale colour and at times rosy cheeks." The interesting statement follows that the men wear the Khasi-Mikir sleeveless coat. Under the heading of dress this will be found described as a garment which leaves the neck and arms bare, with a fringe at the bottom and with a row of tassels across the chest, the coat being fastened by frogs in front. It is a garment of a distinctive character and cannot be mistaken; it used to be worn largely by the Khasis, and is still used extensively by the Syntengs and Lyngams and by the Mikirs, and that it should have been found amongst these Eastern Nagas is certainly remarkable. It is to be regretted that the investigations of the Ethnographical Survey, as at present conducted, have not extended to these Eastern Nagas, who inhabit tracts either outside British territory or in very remote places on its confines, so that we are at present unable to state whether any of these tribes possess other points of affinity, as

* It is interesting to compare the remarks of M. Aymonier in his volume iii. of "Le Cambodge." He writes as follows:—"Mais en Indo-Chine on trouve, partout disséminé, ce que les indigènes, au Cambodge du moins, appellent, comme les peuples les plus éloignés du globe 'les traits de foudre.' Ce sont ici des haches de l'âge néolithique ou de la pierre polie, dont la plupart appartiennent au type répandu en toute la terre. D'autres de ces celtes, dits épaulés, parce qu'ils possèdent un talon d'une forme particulière, paraissent appartenir en propre à l'Indo-Chine et à la presqu'île dekkhanique. Ils fournissaient donc un premier indice, non négligeable, d'une communauté d'origine des populations primitives des deux péninsules, cis et trans gangétique."

1: Gurdon E-4,5 (no date) 1907 AR7 Khasi AR7

shield of Cherrapunji is used as a protection from rain. 293
Those of Maharam and Mawiang are each of a peculiar pattern. 352
Smaller shields are used as protections from the sun or merely for show, and there are specially small sizes for children. Then there are the different kinds of basket (*ki* 415
kkok) which are carried on the back, slung across the forehead 482
by a cane head-strap. These, again, are of different sizes. They are, however, always of the same conical shape, being round and broad-mouthed at the top and gradually tapering to a point at the bottom. A bamboo cover is used to protect the contents of the basket from rain. There is a special kind of basket made of cane or bamboo with a cover, which is used for carrying articles on a journey. These baskets, again, are of different sizes, the largest and best that the writer has seen being manufactured at Rambrai, in the south-western portion of the hills. 412
Paddy is husked in a wooden mortar by means of a heavy 415
wooden pestle. These are to be seen all over the hills. The 256
work of husking paddy is performed by the women. A bamboo sieve is sometimes used for sifting the husked rice, a winnowing fan being applied to separate the husk. The cleaned rice is exposed to the sun in a bamboo tray. Paddy is stored in a separate store-house in large circular bamboo receptacles. These hold sometimes as much as 30 maunds* of grain. Large baskets are also used for keeping paddy in. In 415
every Khasi house is to be found the net bag which is made 825
out of pineapple fibre, or of a *stein*, the Assamese *riha* 436
(Boehmeria nivea). These bags are of two sizes, the larger one for keeping cowries in, the cowrie in former days having been used instead of current coin in these hills, the smaller for the ever necessary betel-nut. *Pân* leaves are kept in a bamboo tube, and tobacco leaves in a smaller one. Lime, for eating with betel-nut, is kept in a metal box, sometimes of silver, which is made in two separate parts held together by a chain. The box is called *ka shanam*, and 415
is used all over the hills. This box is also used for 781
divination purposes, one end of it being held in the hand, and the other, by means of the chain, being allowed to swing

* The maund is 82 lbs. 804

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

415 like a pendulum. An explanation of this method of divination
787 will be found in the paragraph dealing with divination.

There is also a pair of squeezers used by the old and
412 toothless for breaking up betel-nut. In the houses of the
415 well-to-do is to be seen the ordinary hubble-bubble of
322 India. Outside the houses of cultivators are wooden troughs hollowed out of the trunks of trees, which are used either as drinking troughs for cattle or for feeding pigs. A special set of utensils is used for manufacturing liquor. The Synteng and War artisans of furniture and utensils are the same as those of the Khasis, with different names, a remark which applies
415 also to those of the Bhois and Lynngams. Both the latter,
824 however, use leaves as plates, the Bhoi using the wild plantain and the Lynngam a large leaf called *ka 'la mariong*. The leaves are thrown away after eating, fresh leaves being gathered for each meal. The Lynngams use a quilt (*ka syllor*) made out of
513 the bark of a tree of the same name as a bed covering. This
824 tree is perhaps the same as the Garo *simpak*. In the Bhoi and
417 Lynngam houses the swinging shelf for keeping firewood is not to be seen, nor is the latter to be found amongst the sub-montane Bodo tribes in Assam.

MUSICAL INSTRUMENTS.

534 The Khasis have not many musical instruments, and those that they possess, with one or two exceptions, are of very much the same description as those of the Assamese. There are several kinds of drums, viz. *ka nakrá*, which is a large kettle-drum made of wood having the head covered with deer-skin; *ka kaing*, which is a cylindrically-shaped drum rather smaller than the *Assamese dhol* (*ka kaing kynthei* takes its name from the fact that this drum is beaten when women, *kynthei*, dance). *ka padiah*, a small drum with a handle made of wood; *katam*, a small circular drum. Khasi drums are nearly always made of wood, not of metal, like the drums to be seen in the monasteries of Upper Assam, or of earthenware, as in Lower Assam.

Ka dwitara is a guitar with maga silk strings, which is

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

played with a little wooden key held in the hand. *Ka mariyngod* is an instrument much the same as the last, but is played with a bow like a violin. *Ka marynthing* is a kind of guitar with one string, played with the finger. 534

Ka tángmari is a wooden pipe, which is played like a flageolet. *Ka kynshiw*, or *shákuriaw*, are cymbals made of bell metal; *ka shiréti*, or *ka shingwiang*, is a kind of flute made of bamboo. This instrument is played at cremation ceremonies, and when the bones and ashes of a clan are collected and placed in the family tomb, or *máwbah*. This flute is not played on ordinary occasions. In the folk-lore portion of the Monograph will be found a tale regarding it. There are other kinds of flutes which are played on ordinary occasions. The Wárs of the twenty-five villages in the Khyrim State make a sort of harp out of reed, which is called *ka 'sing díng phong*. The Khasis also play a Jews' harp (*ka miang*), which is made of bamboo. [364] [364]

AGRICULTURE.

The Khasis are industrious cultivators, although they are behindhand in some of their methods of cultivation, (e.g. their failure to adopt the use of the plough in the greater portion of the district); they are thoroughly aware of the uses of manures. Their system of turning the sods, allowing them to dry, then burning them, and raking the ashes over the soil, is much in advance of any system of natural manuring to be seen elsewhere in the Province. The Khasis use the following agricultural implements:—A large hoe (*mukhiw hok*), an axe for felling trees (*u ádie*), a large da for felling trees (*ka wait lyngpam*), two kinds of bill-hooks (*ka wáit prat* and *ka wáit 'ñamat*), a sickle (*ka ráshi*), a plough in parts of the Jaintia Hills (*ka lyngkor*), also a harrow (*ka ñuh mei*). In dealing with agriculture, the lands of the Khasi and Jaintia Hills may be divided into the following classes:—(a) Forest land, (b) wet paddy land called *hali* or *pynthor*, (c) high grass land or *ka ri lám* or *ka ri phlang*, (d) homestead land (*ka 'dew hypér*). Forest lands are cleared by the process known as *jhuming*, the trees being felled early in the winter and allowed to lie till January or February. 241 412 241

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

the ground, and well oiled. A silver ornament, or a few rupees, placed at the top, reward the successful climber." A leg of mutton, or a piece of pork fixed at the top of this pole would render the pastime identical with the "greasy-pole" climbing of English villages. The following are some other Khasi games:— 524

Wrestling; two persons grasping each other's hands with the fingers interlocked, and then trying to push one another down; tug-of-war with a piece of stick, the two combatants placing their feet one against the other; butting at one another like bulls, and trying to upset each other (*in tur masi*); long jump; high jump; blind-man's buff; flying kites; pitching cowries into a hole in the ground; a game like marbles, only played with round pebbles, and others. 526 527

MANUFACTURES.

The manufactures of the Khasis are few in number, and do not seem to show any tendency to increase. On the contrary, two of the most important industries, the smelting of iron ore and the forging of iron implements therefrom, and the cotton-spinning industries at Mynso and Suhtnga, show signs of dying out. Ploughshares and hoes and bill-hooks can now be obtained more cheaply from the plains than from the forges in the hills, and Manchester piece goods are largely taking the place of cloths of local manufacture. The iron industry in former days was an important one, and there is abundant evidence that the workings were on a considerable scale, e.g. at Yongkroro and Laitkynghot, in the shape of large granite boulders which have fallen to the ground from the sides of the hills owing to the softer rock which filled the interstices between the boulders having been worked out by the iron-workers, their process being to dig out the softer ferruginous rock, and then extract the iron ore from it by means of washing. The softer rock having been removed, the heavier portions fell by their own weight, and rolled down to the bottom of the slopes, the result being the great number of boulders to be seen near the sites of these workings. 321 288 442 527 34

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

327 Colonel Lister, writing in 1853, estimated that 20,000 maunds
439 of iron were exported from the hills in the shape of hoes to
412 the Assam Valley, and in lumps of pig iron to the Surma Valley, where it was used by boat-builders for clamps. Nowadays the smelting of iron is carried on in very few places. There are still smelting-houses at Nongkrem and Nongsprung, but these are practically the only places left where smelting of iron ore goes on; there are many forges where rough iron brought from the plains is melted down and forged into bill-hooks and hoes. Messrs. Yule and Craeroft have described the
113 native process of smelting iron, and it is only necessary to refer
114 to their papers if information is required on the subject. Yule's
327 account is a very full one, and is to be found at page 853, vol. xi. part ii. of the Journal of the Asiatic Society of Bengal. The system pursued, both in the extraction and in the subsequent smelting of the ore, is the same at the present day as that
327 described by Yule. Dr. Oldham, writing in 1863, says, "The quality of this Khasi iron is excellent for all such purposes as Swedish iron is now used for. The impurity of the blooms (or masses of the metal in a molten state), however, as they are sent to market, is a great objection to its use, and the waste consequent thereon renders it expensive. It would also form steel or wootz (Indian steel) of excellent quality. I have no doubt that the manufacture could be greatly improved and possibly extended." Dr. Oldham, however, goes on to remark that the manufacture of iron could not be very much extended, owing to the scanty dissemination of the ore in the rocks, and the consequent high cost of obtaining it. At present the want
[312] of any permanent supply of water prevents the natives from working for more than a few days during the year, whilst the rains are heavy, and they can readily obtain sufficient force of water for the washing of the ore from its matrix. The export of iron in any form from the district has now almost died out, only a few lots being brought down by the Khasis from Laitkem, in Khaslawpliya, to the Bordwar and Palasbari markets in the Kamrup District of the Assam Valley. Iron of English manufacture has, of course, much cheapened the market, but probably the fact that the parts of the country in the neighbourhood of the rocks which contain the metal have

291 women at Nongstoin wearing gaiters of leaves. It was explained to me that these were worn to keep off the leeches. The Khasi women might almost be said to be excessively clothed—they wear the cloak in such a way as to hide entirely the graceful contours of the figure. The women are infinitely more decently clothed than Bengali coolie women, for instance; but their dress cannot be described as becoming or graceful, although they show taste as regards the blending of colours in their different garments.

The dress of the Syntengs women is a little different. With them the *jain khrywong* takes the place of the Khasi *jainsem*, and is worn by them in the following manner:—One of the two ends is passed under one armpit and its two corners are knotted on the opposite shoulder. The other end is then wound round the body and fastened at the waist, from which it hangs half way down the calf. Over this they wear a sort of apron, generally of *muga* silk. They have the cloak and the head-wrapper just the same as the Khasi women. The Syntengs striped cloth may be observed in the picture of the Syntengs girl in the plate. Khasi women on festive occasions, such as the annual Nongkrem puja, do not cover the head. The hair is then decked with jewellery or with flowers; but on all ordinary occasions Khasi women cover the head. War women, however, often have their heads uncovered.

Modern Dress.—The up-to-date Khasi male wears knickerbockers made by a tailor, stockings, and boots; also a tailor-made coat and waistcoat, a collar without a tie, and a cloth peaked cap. The young lady of fashion dons a chemise, also often a short coat of cloth or velvet, stockings, and women's shoes. Of course she wears the *jainsem* and cloak, but occasionally she may be seen without the latter when the weather is warm. It should be mentioned that the Khasi males are seldom seen without a haversack in which betel-nut, lime, and other odds and ends are kept; and the female has her purse, which, however, is not visible, being concealed within the folds of her lower garment. The haversack of the men is of cloth in the high plateau and in the Bhoi country, but it is of knitted fibre in the War country. The Syntengs have a cloth bag, which they call *ka wasa*.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

blackened with the smoke of years, upon which are spread the faggots of resinous fir-wood used for kindling the fire. Above this again is a wooden framework fixed on to the beams of the house, upon which all sorts of odds and ends are kept. Around the fire are to be seen small wooden stools, upon which the members of the household sit. Up-to-date Khasis have cane chairs, but the women of the family, true to the conservative instincts of the sex, prefer the humble stool to sit upon. Well-to-do Khasis nowadays have, in addition to the ordinary cooking vessels made of iron and earthenware, a number of brass utensils. The writer has seen in a Khasi house in Mawkhar brass drinking vessels of the pattern used in Orissa, of the description used in Manipur, and of the kind which is in vogue in Sylhet. The ordinary cultivator, however, uses a waterpot made from a gourd hollowed out for keeping water and liquor in, and drinks from a bamboo cylinder. Plates, or more properly speaking dishes, are of several kinds in the houses of the rich, the two larger ones being styled *ka phiang kyrhai* (female) and *ka phiang shyrong* (male). Needless to say, the first mentioned is a larger utensil than the latter. The ordinary waterpots, *u khiew phiang kyrhai* and *u khiew phiang shyrong*, are made of brass, the former being a size larger and having a wider mouth than the latter. The pot for cooking vegetables is made of iron. Another utensil is made of earthenware; this is the ordinary cooking pot used in the houses of the poor. Brass spoons of different sizes are used for stirring the contents of the different cooking utensils, also a wooden spoon.

In the sleeping-rooms of the well-to-do there are wooden beds with mattresses and sheets and pillows, clothes being hung upon clothes-racks, which in one house visited were of the same pattern as the English "towel horse." The ordinary cultivator and his wife sleep on mats made of plaited bamboo, which are spread on the bare boards of the house. There are various kinds of mats to be met with in the Khasi houses made of plaited cane, of a kind of reed, and of plaited bamboo. The best kind of mat is prepared from cane. In all Khasi houses are to be seen *ki kwap*, or rain shields, of different sizes and sometimes of somewhat different shapes. The large

shield of Cherrapunji is used as a protection from rain. Those of Maharam and Mawiang are each of a peculiar pattern. Smaller shields are used as protections from the sun or merely for show, and there are specially small sizes for children. Then there are the different kinds of basket (*ki khoh*) which are carried on the back, slung across the forehead by a cane head-strap. These, again, are of different sizes. They are, however, always of the same conical shape, being round and broad-mouthed at the top and gradually tapering to a point at the bottom. A bamboo cover is used to protect the contents of the basket from rain. There is a special kind of basket made of cane or bamboo with a cover, which is used for carrying articles on a journey. These baskets, again, are of different sizes, the largest and best that the writer has seen being manufactured at Bamhni, in the south-western portion of the hills. Paddy is husked in a wooden mortar by means of a heavy wooden pestle. These are to be seen all over the hills. The work of husking paddy is performed by the women. A bamboo sieve is sometimes used for sifting the husked rice, a winnowing fan being applied to separate the husk. The cleaned rice is exposed to the sun in a bamboo tray. Paddy is stored in a separate store-house in large circular bamboo receptacles. These hold sometimes as much as 30 maunds* of grain. Large baskets are also used for keeping paddy in. In every Khasi house is to be found the net bag which is made out of pineapple fibre, or of a stem, the *Anamum vilo* (Bauhinia aiton). These bags are of two sizes, the larger one for keeping cowries in, the cowrie in former days having been used instead of current coin in these hills, the smaller for the ever necessary betel-nut. *Pân* leaves are kept in a bamboo tube, and tobacco leaves in a smaller one. Lime, for chewing with betel-nut, is kept in a metal box, sometimes of silver, which is made in two separate parts held together by a chain. The box is called *ka shanam*, and is used all over the hills. This box is also used for divination purposes, one end of it being held in the hand, and the other, by means of the chain, being allowed to swing

* The maund is 82 lbs.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

like a pendulum. An explanation of this method of divination will be found in the paragraph dealing with divination.

There is also a pair of squeezers used by the old and toothless for breaking up betel-nut. In the houses of the well-to-do is to be seen the ordinary hubble-bubble of India. Outside the houses of cultivators are wooden troughs hollowed out of the trunks of trees, which are used either as drinking troughs for cattle or for feeding pigs. A special set of utensils is used for manufacturing liquor. The Synteng and *War* articles of furniture and utensils are the same as those of the Khasis, with different names, a remark which applies also to those of the Bhois and Lyungams. Both the latter, however, use leaves as plates, the Bhoi using the wild plantain and the Lyungam a large leaf called *ka 'la mariong*. The leaves are thrown away after eating, fresh leaves being gathered for each meal. The Lyungams use a quilt (*ka syllar*) made out of the bark of a tree of the same name as a bed covering. This tree is perhaps the same as the Garo *simpok*. In the Bhoi and Lyungam houses the swinging shelf for keeping firewood is not to be seen, nor is the latter to be found amongst the submontane Bodo tribes in Assam.

MUSICAL INSTRUMENTS.

The Khasis have not many musical instruments, and those that they possess, with one or two exceptions, are of very much the same description as those of the Assamese. There are several kinds of drums, viz. *ka nikrá*, which is a large kettle-drum made of wood having the head covered with deer-skin; *ka ksing*, which is a cylindrically-shaped drum rather smaller than the Assamese *dhol* (*ka ksing kynthei* takes its name from the fact that this drum is beaten when women, *kynthei*, dance), *ka padiah*, a small drum with a handle made of wood; *kataas*, a small circular drum. Khasi drums are nearly always made of wood, not of metal, like the drums to be seen in the monasteries of Upper Assam, or of earthenware, as in Lower Assam.

Ka dwitara is a guitar with *muga* silk strings, which is

I: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

323 Larnai. The Larnai potters make many of the earthen pots to be found in the Khasi houses called *khiew rasai*, or sometimes *khiew Larnai*. Mr. Gait says, "These potters use two kinds of clay mixed, one is of a dark blue colour, 'dew-ieng, and the other of a greyish colour, 'dew khiwid. These clays seem to correspond closely with the *kumar mati* and *hiew mati* of the Brahmaputra Valley."

323 The clay at Larnai is well beaten out upon a hide, or upon a
415 flat disc of wood; the women fashion the pots by hand, they do
425 not use the potter's wheel. The pots are sun-dried and then fired. They are painted black with an infusion of a bark called *sohliya*. The Larnai potters also make flower-pots which are sold in Shillong at from 2 annas to 4 annas each, the price of the ordinary pot or *khiew rasai* varying from 2 pice to 4 annas each. A water-pot (*khiew um*) is also fashioned, which is sometimes used in the manufacture of liquor, price 4 annas to 6 annas each.

St Gordon E-4, 5 (no date) 1907 AR? Khasi AR?

quilt, made out of the bark of a tree, which is beaten out and then carefully woven, several layers of fastened bark being used before the right thickness is obtained. This quilt is called by the Lyngngam "*Ka sylhet*" (Garo *simpet*). Food is cooked in earthen pots, but no plates are used, the broad leaves of the *mawlong* tree taking their place. The leaves are thrown away after use, a fresh supply being required for each meal.

The Lyngngam have sun bears, they do not distil spirit, the bier is lowered according to the Khasi method. Games they have none, and there are no social archery meetings like those of the Khasis. The Lyngngam methods of hunting are setting spring guns and digging pitfalls for game. The people say that now the Government and the Sirdar of Nongstoin have prohibited both of these methods of destroying game, they no longer employ them. But I came across a pitfall for deer not long ago in the neighbourhood of a village in the Lyngngam country. The people declared it to be a very old one; but this I very much doubt, and I fear that these objectionable methods of hunting are still used. The Lyngngam fish to a small extent with nets, but their idea of fishing *par excellence*, is poisoning the streams, an account of which has already been given in this monograph. The Lyngngam are omnivorous feeders, they may be said to eat everything except dogs, snakes, the Indian monkey, and lizards. They like rice, when they can get it; for sometimes the outturn of their fields does not last them more than a few months. They then have to fall back on Johnson and millet. They eat arum largely, and for vegetables they cook wild plantains and the young shoots of bamboo and cane plants. The Lyngngam are divided up into exogamous clans in the same manner as the Khasis. The clans are exogamous families. The Lyngngam have some stories regarding the founders of these clans, of which the following is a specimen:—"A woman was asleep under a *sylhet* tree in the jungle, a flower from which fell on her, and she conceived and bore a female child who was the ancestress of the Nongsiddar clan." Some of the stories of the origin of other clans do not bear repeating. There do not appear to be any hypergamous groups. As with the Khasis, it is a deadly sin to

of them, more especially when the latter are situated in places where jungle is dense, and there is fear of attacks from wild animals. In the Lyngpun village is to be seen a high bamboo platform some 20 to 30 ft. from the ground, built in the midst of the village, where the elders sit and gossip in the evening.

All the villages, Khasi, War, Lyngpun and Bhoi, swarm with pigs, which run about the villages unshacked. The pigs feed on all kinds of filth, and in addition are fed upon the wort and spent wash of the brewings of country spirit, or rice beer, the latter being carefully collected and poured into wooden troughs. The pigs are of the usual black description seen in India. They thrive greatly in the Khasi villages, and frequently attain extreme obesity.

In the Khasi villages of the high plateaux are often seen large potato gardens, the latter being carefully protected from the inroads of pigs, calves, and goats by dry dikes surmounted by hedges.

I noticed an interesting custom at a Bhoi village in Nongpoh of barricading the path leading to the village from the forest with bamboo palisading and bamboo chevaux de frise to keep out the demon of cholera. In the middle of the barricade there was a wooden door over which was nailed the skull of a monkey which had been sacrificed to this demon, which is, as amongst the Syntengs, called Ikkiow.

OTHER AND MODERNIZED FURNITURE.

As in the case of houses, so with reference to furniture, the influence of civilization shows many changes. The Khasi of the present day who lives in Mawkhar * has a comfortable house regularly divided up into rooms in the European style with even some European articles of furniture, but owing probably to the influence of the women, he still possesses several of the articles of furniture which are to be met with in the houses of those who still observe the old style of living. Let us take the furniture of the kitchen to begin with. Above the hearth is slung by ropes of cane a swinging wooden framework

* Mawkhar is a suburb of Shillong, the headquarters station.

1:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

blackened with the smoke of years, upon which are spread the faggots of resinous fir-wood used for kindling the fire. Above this again is a wooden framework fixed on to the beams of the house, upon which all sorts of odds and ends are kept. Around the fire are to be seen small wooden stools, upon which the members of the household sit. Up-to-date Khasis have cane chairs, but the women of the family, true to the conservative instincts of the sex, prefer the humble stool to sit upon. Well-to-do Khasis nowadays have, in addition to the ordinary cooking vessels made of iron and earthenware, a number of brass utensils. The writer has seen in a Khasi house in Mawkhar brass drinking vessels of the pattern used in Orissa, of the description used in Manipur, and of the kind which is in vogue in Sylhet. The ordinary cultivator, however, uses a waterpot made from a gourd hollowed out for keeping water and liquor in, and drinks from a bamboo cylinder. Plates, or more properly speaking dishes, are of several kinds in the houses of the rich, the two larger ones being styled *ka pliang kyrkhei* (female) and *ka pliang shyrong* (male). Needless to say, the first mentioned is a larger utensil than the latter. The ordinary waterpots, a *khiew pliang kyrkhei* and a *khiew pliang shyrong*, are made of brass, the former being a size larger and having a wider mouth than the latter. The pot for cooking vegetables is made of iron. Another utensil is made of earthenware; this is the ordinary cooking pot used in the houses of the poor. Brass spoons of different sizes are used for stirring the contents of the different cooking utensils, also a wooden spoon.

In the sleeping-rooms of the well-to-do there are wooden beds with mattresses and sheets and pillows, clothes being hung upon clothes-racks, which in one house visited were of the same pattern as the English "towel horse." The ordinary cultivator and his wife sleep on mats made of plaited bamboo, which are spread on the bare boards of the house. There are various kinds of mats to be met with in the Khasi houses made of plaited cane, of a kind of reed, and of plaited bamboo. The best kind of mat is prepared from cane. In all Khasi houses are to be seen *ki kwap*, or rain shields, of different sizes and varieties of somewhat different shapes. The large

1:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

like a pendulum. An explanation of this method of divination will be found in the paragraph dealing with divination.

There is also a pair of spectacles used by the old and feeble for looking up hand-out. In the houses of the well-to-do is to be seen the ordinary bubble-bubble of India. Outside the houses of cultivators are wooden troughs hollowed out of the trunks of trees, which are used either as drinking troughs for cattle or for feeding pigs. A special set of utensils is used for manufacturing liquor. The farming and War articles of furniture will utensils are the same as those of the Khasis, with different names, a remark which applies also to those of the Bhoia and Lyngnam. Both the latter, however, use leaves as plates, the Bhoi using the wild plantain and the Lyngnam a large leaf called ka ka maniang. The leaves are thrown away after eating, fresh leaves being gathered for each meal. The Lyngnam use a quilt (ka ngilar) made out of the bark of a tree of the same name as a bed covering. This tree is perhaps the same as the Gara elongata. In the Bhoi and Lyngnam houses the swinging shelf for keeping firewood is not to be seen, nor is the latter to be found amongst the sub-montane Bodo tribes in Assam.

MUSICAL INSTRUMENTS.

The Khasis have not many musical instruments, and those that they possess, with one or two exceptions, are of very much the same description as those of the Assamese. There are several kinds of drums, viz. ka nakai, which is a large bottle-drum made of wood having the head covered with dam-skin; ka kiang, which is a cylindrically-shaped drum rather smaller than the Assamese khol (ka kiang kyrdei) takes its name from the fact that this drum is beaten when women, kyrdei, dance); ka pudiah, a small drum with a handle made of wood; ka tiam, a small circular drum. Khasi drums are nearly always made of wood, not of metal, like the drums to be seen in the monasteries of Upper Assam, or of earthenware, as in Lower Assam.

Ka dieiaw is a guitar with eight silk strings, which is

It Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

should inherit the property and not men. The rule amongst the Khasis is that the youngest daughter "bokla" the religion, "ka bud ka niam." Her house is called, "ka ing sang," and it is here that the members of the family assemble to witness her performance of the family ceremonies. Here is, therefore, the largest share of the family property, because it is she whose duty it is to perform the family ceremonies, and propitiate the family ancestors. The other daughters, however, on their mother's death are entitled, each of them, to a share of their mother's property, although the youngest daughter gets the lion's share, e.g. the family jewellery, and the family house, and the greater part of what it contains. The youngest daughter cannot dispose of the house without the unanimous consent of her sisters. If the youngest daughter dies, she is succeeded by the next youngest daughter, and so on. All the daughters are bound to repair the house of the youngest daughter free of cost. In the event of the youngest daughter changing her religion, or committing an act of sang, or taboo, she loses her position in the family, and is succeeded by her next youngest sister, as in the case of a death. Failing daughters, inheritance would pass by the "knight's move" to the sister's youngest daughter, who would be succeeded by her youngest daughter, and so on. Failing sister's daughters succession would revert to the mother's sisters and their female descendants. In the Jaintia Hills the inheritance of all real property passes from mother to youngest daughter. No men in the uplands of the Jaintia Hills can possess landed property, unless it is self-acquired property. In the Jaintia Hills, if a man dies and leaves acquired property, his heir will be his mother, if alive, excluding wife, sons, and daughters. If the wife, however, undertakes not to re-marry, she will inherit half of her husband's property, which at her death will descend to her youngest daughter by him.

Amongst Khasis all property which has been acquired by a man before marriage is considered to belong to his mother; indeed it may be said to belong to the man's *lineage*, or *clan*, such property being called by Khasis, "ka mad ding hun" (the earnings of the house of the clan). After marriage, if there are children, the case is different, provided that the property

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

42/ has been acquired by the man after marriage. Here the wife
428 and children would inherit the acquired property, the youngest daughter obtaining the largest share of such property on the death of the wife. If there were no daughter, the acquired property would be equally divided amongst the sons.

[127] The following examples of the Syntong law of inheritance are taken from the exhaustive diaries recorded by the late Mr. Heath, who was for some years Sub-Divisional Officer of Jowai. In the Nongkli doloship ancestral land passes from mother to her youngest daughter; again, if a youngest daughter who has no acquired dies, the next, youngest in point of age succeeds. Should such direct female succession fail, the family tree has to be looked up for the nearest branch, in which the youngest female, or her youngest female descendant, succeeds. Thus, succeeding ancestral land, the youngest daughter, or youngest female descendant of youngest female heir, is virtually heir to entailed property. If a woman dies having acquired property, her youngest daughter or youngest granddaughter of that youngest daughter succeeds to all. In default, next youngest daughter, and so on. In default of daughters, the youngest son inherits. A man can hardly, in any circumstances, possess ancestral land; his property must almost necessarily be self-acquired. If a man dies having acquired property, his heir will be his mother, if alive, excluding wife, sons, and daughters. If the wife undertakes, however, not to marry again, she will get half, which will descend to her youngest daughter by her deceased husband. The mother, who thus gets the whole or half of her son's property, leaves it to her youngest daughter, or youngest daughter of that daughter, and so on, as described above in the case of a woman leaving ancestral or acquired property. If there is no mother, the man's youngest sister stands next heir with the same right as her mother. If there is no mother or sister, then the sister's female descendants stand in the man's mother's place. If there are none of these, then the man's youngest daughter succeeds to all. Ancestral property cannot be alienated without the consent of all the heirs in the entail. A gift of self-acquired property to any amount can be made by a donor during his lifetime. Acquired property cannot, however, be left by will out of the course mentioned by

1:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

The adoption of a female obviates the family dying out (*iap dak*), which to the Khasi is a very serious matter, inasmuch as there will then be no one qualified to place the bones of its members within the family tomb (*ka ka thep shiong mawbah*), and to perform the requisite funeral ceremonies. Amongst the Khasis no particular ceremonies are performed at the time of adoption; but some of the Syntengs observe a religious ceremony which consists largely of a feast to the clan-folk, at which liquor, rice, dried fish, and ginger are partaken of. Before the feast commences, each clansman is provided with a small gourd (*u blangi*) filled with liquor, a little of the latter is then thrown on the ground from the gourd, and the following words are uttered:—

"Oh, God! oh, Lord! oh, ruling king Binkrum, now the *pynsop ding* ceremony is about to be performed, let the ceremony be propitious, and let males and females (of the clan) increase in numbers, so that the clan may become great, and respected, and that intelligent male members may spring up." No such ceremony is, however, observed, it is understood, in the Nartiang and Rulang dolinships.

In the case of a family being *iap dak* (extinct), the family property, according to Khasi custom, passes to the Siem. Therefore it is to the interest of the members of families to adopt a female, when such necessity arises. As there is no religious ceremony which is compulsory to the Khasis on the occasion of an adoption, perhaps we are almost justified in concluding that in former times the adoption custom did not exist, more especially as the Khasis possess a special word, *iap dak*, for describing a family the females of which have all died out; and it is admittedly the custom for the Siem to succeed to the property of such a family. The Syntengs custom of *'sop ding* may have been borrowed from the Hindus, when the Rajas of Jaintia became converts to that religion.

TENURE OF LAND AND LAWS REGARDING LAND.

Land in the Khasi Hills proper, i.e. land in the high plateau, is held somewhat differently from land in the Jaintia Hills and

there than a thousand of them who have been converted to the Hindu religion.

This group of people possesses the possibility of expansion, since they have at their disposal within the area of the Khasi and Jaintia Mountains a territory of 6,022 English square miles, with only 48 persons per square mile. Although wide areas are not built up and the system of shifting fields prevents the full utilization of the land, it is still true that with this small population figure by far the largest part of the whole population (286,701) is dependent on agriculture; trade and manufacturing only play a subordinate part.

With regard to the division of the sexes, the two large religions of Assam, Hinduism and Mohammedanism, show the same proportion as in the rest of India, a lower number of women than men. But among the Khasi the women are more numerous than the men. In the Brahmaputra valley with its greater Hindu population there are only 892 women for every 1,000 men; in the Surma valley, with a greater Moslem element, there are 907. But the situation is reversed among the Khasi, where there is a surplus of 74 women for every thousand men. The position of the women is basically different among this people. It is based on the customs and usages of mamowal rights that prevail among them, which are predominantly based on possession and which find honorable expression in possession.

I. Property Rights in the Family Property.

The great principle which governs property among the Khasi, is that all family property rests in the hands /120. A/ /Fig. 1. Khasi Girls and Women with their Carrying Baskets. Fig. 2. An Old Clan Mother in the Village Lakroubiha. / /120. B/ /Fig. 3. At the Oracle of Egg Throwing/ Fig. 5. Khasi Girls and Men in Festive Dance Clothing. / /120 C/ /Fig. 4. A Group of Spinning/ /120. D/Fig. 6. A Holy Grove and Part of the Village Railing/ /120/ of the women and not of the man. The man can never be the owner of family property, and it can never be transferred to him. He may perhaps acquire some property through his own industry and work, but even that will pass into feminine hands by the path of inheritance. The concept of family is not as narrowly drawn here as in our country. This is a question of the clan-family, the clan. The head of it is always the youngest daughter, who, even when she has become old, bears the honorable name ka Iarbi in the Jaintia Mountains, and in the Khasi Mountains ka Khadduh, the last, the youngest. Around her gather her nearest blood relatives, brothers and sisters, and children. For example her

453 manure, and primarily for breeding, since the ones cannot be dis-
28 pensed with for the cultivation of the field, especially of the rice fields, where the soaked earth must be trampled to a slimy mush. From the fowl the eggs are particularly prized, since they find an almost daily use in the questioning of oracles in cases of misfortune and sickness. (3) Hens, pigs and goats serve for sacrificial purposes,(4)

and they are also a welcome addition to rice at all festive occasions such as arrow shooting, (1) at the name giving, /12/ at weddings,

1. Becker, In Nowmai etc., /In the Valley, etc./, pp. 236 and 267.

and at the cremation of the dead.

453 Further the various huts belong to the family property, the erec-
61 tion and maintenance of which is the work of the members of the clan, the brothers, nephews, and grandsons. The hut of the clan mother is likewise considered the center of the whole family, and its possession forms the outer sign of the dominance of the clan mother. Here she holds the family sacrifices and also keeps the special treasures. These are considered to be those things which are connected with the religious cult. Special reverence and sacrifice is due the oldest clan mother, as the original founder of the clan, and her brother is each clan family; in addition there are a series of other spirits which vary according to the family clan. The branch of the Khasi people who live in the Jaintia Mountain, the so-called Synteng, have probably preserved the old Khasi customs the most faithfully. There in the hut of the
78 clan mother are found the following utensils for the service of the
79 divinities, who are nearly always feminine: mats, little baskets for rice, gourd bottles, a little basket made of bamboo cane and decorated with feathers, as well as antlers of deer or antelopes. The latter are fastened to the wall; they are supposed to be the seat of the

776 divinities of the forest and of the chase. The little basket is at-
778 tached to a post in the hut; the special divinities of the clan-
family are supposed to have their dwelling there; two bamboo
twigs fastened underneath symbolize their power. The gourd bot-
tles are used as containers for the sacrificial drink of rice liquor. (6)

6. Cf. Dai Nongkseels-Puja, /The Nongkseels Puja/, loc cit.

422 As treasures, which are handed down from generation to generation,
[Ka] are considered the rich ornaments of gold and silver, the heavy
chains of coral, and the silk scarves, which are worn by the women
at dancing ceremonies.

Also those things which the family has contain in the way of
furnishings and utensils, such as baskets, mats, lances, shields, ar-
rows and bows, and brass pots for cooking and for water, earthen
containers and brass plates are considered common property of the
family.

● 421 /130/ The clan mother at the time has the entire property in
425 her hands, she is the legal and sole guardian and manager of the prop-
428 erty. Nothing can be lost even without her permission. No part of
either the movable or immovable family possessions may be sold
without her agreement. For the execution of the proper legal deed,
as she is often ignorant of writing, she must place her fingerprint.
Nothing may ever be given away; that would be an insult to the clan
divinity since that would not mean preserving and honoring their
property but giving it away as being of no value. As a punishment
for that the clan /manom/ would also lose its other possessions and
then live in poverty and disgrace. The individual members of the
clan could sometimes be recruited for work for other clan-families
as a kind of slave (mawa). But they may not be taken up in their
society as they do not belong to that clan and the clan gods of that
family would not permit it. Therefore if, for example, a clan-
family has rice fields which they do not cultivate and would gladly give
to poorer relatives, they must at least receive the smallest rent as a
charge for it. This consists usually of a good bottle of rice liquor,
which has the value of about 70 pfennigs to hence the household
divinities.

Before the clan mother gives her permission for the sale of com-
mon property, she listens to the advice of the other members of the
clan. Actually according to the old tribal custom things should be
so little sold as given away. It is said that in ages past the original
ancestors, when the individual clans numbered as tradition, appor-
tioned out the then lands of field and wood, and there are supposed
421 to have their unsalable clan property (mawlah). To lot is got out of
425 one's possession would therefore be doubting the gods. However, that

could not prevent individuals from becoming needy through misfortune 421
e laziness and their trying to rent a part of their property for an annual 425
ayment or for a sum needed once. This is called ban die pan, liter-
lly: begging to buy. The sense of relinquishing by lending /135/ is
contained in this. For example, a field is worth 300 reichsmarks.
fty or 100 reichsmarks are accepted for it and the creditor remains
he owner of the field until the money is repaid. This type of pur-
hase occurs frequently. There are frequently traders (sunghuil)
who try to use such purchases to their own advantage. They turn over
he field to the debtor for further cultivation in return for payment in
produce of 50 to 70 per cent of the harvest. After several years the
whole field is their property. Aside from this method, it also happens
hat instead of being able to repay the money the people need still
further sums. In that case then the entire price of 300 reichsmarks is
paid and the actual purchase is considered completed; that is called
van die lot; literally: totally, completely sold. A family-clan which
gradually loses its property in this manner descends into poverty and
need. There is nothing else for it to do than to look for work else- [341]
where, to rent land or to sell the children as a kind of slaves to better
situated people. If 40 reichsmarks are paid for a child of about 10
years, he remains in the bondage of the buyer until the money can be
repaid. That happens only rarely. Besides food and the most neces-
sary clothing only one rupee is deducted annually as wage from the
purchase price; thus, practically, the child belongs to the buyer for
the duration of his life.

It is the duty of individual members of a family clan to work to- 671
gether so that the clan property will be maintained and will produce 674
the necessary amount for the maintenance of all. The clan mother
must oversee primarily that the appropriate customs and usages are
observed. She is held in high esteem by all. To do something
against her wish to offend her, to call her insulting names, or to go
so far as to strike her is considered sang (taboo), a severe crime that
causes misfortune. It is a great sin (pep) and a thoroughly great dis- 671
grace (ongkwah eh tung) for the whole clan.(7) As long as a member 681
762

7. Also considered similar crimes are selling clan property in secret, incest, desecrating burial places in a coarse manner, making use of holy grounds or woods.

/135/ of the family has committed such a crime and has not begged
pardon from the clan mother and the elders of the clan, perhaps with
the words: pardon me, I have committed an error (to mop in ngo leh

428 she does not have any daughter, the property will pass to the female descendants of sisters of Ka Long, as her elder sisters Ka Laimon and Ka Laiban have left no daughters. It is therefore necessary to distinguish carefully between an elder and a younger sister, and also similarly between sisters of the mother. The generation of the women of the same house and extended family requires to be noted with care.

The youngest daughter and heiress is termed the Ka Khadduh. As Gastlin remarks the "Ka Khadduh is the custodian of the family property, not the full heir in the sense known to other systems of law, but a limited heir. She is
[364 responsible for the performance of religious ceremonies.....; she cremates her mother, and if she be Ka Khadduh of the whole family, she puts the bones of all members in their final resting place under the stone (mawbah) of the clan. The expenses of this ceremony are considerable and for this reason she gets a larger share of property, or in some cases a piece of family property in addition and apart from her separate share. Members of the family who are unable to earn for themselves and have no children to earn for them have the right of being fed at the ing-Khadduh" (house of the heiress).

429 The management of the property is however vested in the men of the family. The ancestral property of the family of myatri U Subu R..'s mother was under the management of U Joi, in his mother's life-time; then, on the death U Joi, the next brother U Doi became manager. After U Doi, the management came to U Subu Roi. After him, the authority will pass to U Hojon, as U Sumburai is dead and then to U Nodem. Any sons of Ka Pyn and other sisters will not get any precedence over U Nodem. As the senior U Kni of the Iaughlah Kur, U Subu Roi is also the manager of the common property of the Kur.
[427] This land has been leased out to various persons and the total income is divided among the different houses of the Kur.
421 Whenever there is money to be distributed U Subu Roi calls together all the representatives of the Iaughlah houses and

divides equally. U Subu Rai explained that each house counted as a separate unit. Thus if Ka Jem, Ka Jin and all their daughters were alive, the married daughters who lived in a separate house, namely, Ka Laimon, Ka Laiban, Ka Aimon and Ka Hoimon of Ka Jem's house, and Ka Phro of Ka Jin's line, would each get a share. But Ka Jem and her Ka Khadduh Ka Aiban who lives in the mother's house would get only one share. So would Ka Jin, Ka Eirihon and the unmarried daughters of the latter. The descendants of Ka Long would get seven equal shares for distribution to each house, and not two shares first, divided later into shares corresponding to the number of daughters for Ka Jem's and Ka Jin's house. The manager does not get any share of the collections. Authority in the management of the ancestral property therefore passes from one male to another, in the extended family, and the Kur, in a manner which necessitates a clear distinction of seniority and juniority of brothers, among themselves and also of sisters with regard to brothers.

The case of succession is similar. Gordon notes that the headship in Mylliem State passes from a man to his next brother, and "failing such brothers, by the eldest of his sisters' sons; failing such nephews by the eldest of the sons of his sisters' daughters; failing such grand nephews by the eldest of the sons of his mother's sisters" and so forth in the female line. In Nongkrem, the son or similar male relative of the High Priestess becomes by delegation a Siem. The office of the High Priestess passes from a woman to her eldest surviving daughter; and failing daughters to the eldest daughter of her eldest daughter; failing daughters of her eldest daughter, to the eldest daughter of her second daughter, and so on. This is the customary line of succession, and is stated by Gordon to be "uniform in all cases" practically.

Neither levirate, nor sororate are practised by the Khasis. Widows are stated (G) quite often not to remarry if there are daughters. There is no question of the control of the property

587 of the woman by her husband. No occasion arises either of
● 421 taking his place on death, by his brother or by sister's son; or of a sister of a deceased wife being made over to a man, as is the custom among Garos, where the husband of the heiress manages the property of his wife. Among the Khasis, the widow or widower cannot normally remarry before the end of a year after the death of the husband or wife. When a year is over, a payment is made to the Kur of the deceased to remove
587 the disability. If the man or woman want to remarry before
422 the year is out, a larger sum is paid. In Mawphlang, a sum of Rs. 8-4-0 is paid at the end of the year and Rs. 11-4-0 for untimely remarriage (within the year). The payment is made to the Ka Khadduh of the deceased in each case, and a ceremony severing the relations with the dead spouse is performed. A pig is purchased with the money and it is sacrificed in the house of the Ka Khadduh by a man—usually a neighbour. If the deceased was a man, the following invocation is made:
[429] "Ha kane ka ainol ia shim sang sang bad kein sang sang ia phi. Ka ingo ym ym ben ia khmil."

Free translation :—

"On this night the released person is sacrificing to you. The wife of un-and-on (meaning the man) is hereby made pure."

The pig is then killed by thrusting an iron spike through the shoulder. It is then cooked and eaten by the people present. This mode of killing is known as "dang."

The mynsi Gongsing, whose genealogy has been noted, remarried a year after the death of his first wife Ka Bousnai. This woman died two years ago, and the ceremony for removing the bar on remarriage was performed only last year. The money was made over to an old man U Ba, who is well acquainted with the rites. He purchased a pig and killed it by the "dang" method in the compound of Ka Bousnai's mother, Ka Thwellum. The spike might be of wood or iron, stated U Rabon. I was informed by the mynsi U Babu Rai that the ceremony of

Referring to the first type, we may say that the second type results from the men of the house going out to marry women of other houses. As the men settle down in the wife's mother's house and later on set up a separate house on her land, the continuity of tradition in the house of birth is kept up by the women who remain behind.

It would however be a mistake to suppose that the bond between the members born in a house is severed on marriage. We have noted before that the house of a dead man returns eventually to his mother's house, for final deposition in the clan cemetery, or at least that of the extended household. The bond between the mother's brother and sister's children has also been noted as well as the authority exercised by the former over the extended family.

Further links between a man and his mother's Kur will appear from a study of the rules of inheritance and land tenure with regard to men. Any property that a man acquires before marriage belongs to his mother's house. Myatri U Sohn Bai, his maternal uncle, earned money before his marriage, and he purchased some land with this amount, in a village called Mawbah. It will go to his sisters and their heirs on his death. The earnings of a man after marriage, and after he has settled down in his wife's mother's house (or wife's house), among Khasis proper, generally go to the wife and daughters on death. But any gifts made by the parents at marriage have to be returned on death. Similarly, if a man has earned money after marriage, independently of his wife's capital, a part can be claimed on death by the man's mother's group.

Again, if a man returns to his mother's village after marriage, he can exercise his rights to cultivate the common land there. Every village community has its common land known as Ri Raid. As David Roy states (C9), "people can occupy a vacant land where they build their houses and cultivate. For cultivation purposes land not more than can be cultivated is taken. The occupant can sell his house and the site and the garden of

his house or paddy field or grove; but the sale does not extend to anything more than his right of occupancy.....Any site, garden or place of cultivation if abandoned, can be taken by another."

A son of a house of the village, of which the Kur is of the ancient settlers or has been given similar privileges, has the right of building a house, and of cultivating land in the Ri Raid. Reference has been made to the rare practice whereby a man brings his wife from her mother's house to his own village. In such a case he may set up a separate house on the community land, and cultivate some of it, to maintain his wife and children. The property will pass, on his death, to his daughters as usual. It will not go to his mother or sister.

(c) The man U Hariluk married twice, but did not settle down with his wife on either occasion. He built a house in Mawphlang which is his mother's ancestral village and brought each wife there. Both of them were divorced in turn and have left. If any of his wives had lived with him the house would have gone to his daughters. Now, however, the heiress is Ka Jrem, the daughter of a sister. [Genealogy I(iii)].

(d) The woman Ka Lakimon is of the old Lyngkhi clan of Mawphlang. When U Lyngon married her, he set up a house in Mawphlang and cultivated land. But on his death, the woman went away to Shillong with her children, about 10-15 years ago, selling the house and abandoning the jhum land. The son U Bulimar has recently come to Mawphlang and is working in U Subo Rai's house. If he settles down, i.e., marries and wants to set up a house, he can do so on the Ri Raid. (Genealogy IV).

(e) The foundress of the Khar Dumpep clan was a woman of the village Dumpep, and of clan Khar Dedding. She had two other sisters. One of the three sisters went to Mylliem, and another came to Mawphlang while the third remained at Dumpep as Ka Khaddah. The girl who went to Mylliem founded the Khar Sohsah Kur and the girl who came to Mawphlang founded

Khar Dumpep. These three clans—Khar Duhling, Khar Dumpep and Khar Sohnoh cannot intermarry on account of their common ancestry. U Alisem, the sister's husband of U Subu Rai is of Khar Dumpep clan and furnished me with the above details. He stated that his ancestress married a man of the old settler clans of Mawphlong and came to her husband's village. This man, being of the Khadar Kar, could build a house and cultivate land from the community holding. The property thus acquired passed to the daughters; and gradually the clan Khar Dumpep grew more numerous, and acquired rights in the Ri Raid like an old clan. [Genealogy I(c)].

(d) The family of the first wife of U Ongsing furnishes another illustration. The woman Ka Li came with her widowed mother from Cherra. The father had been a Syntong from Jowai. The girl has been married by U Ihohun, who is a member of one of the old settler clans. He has built a house for his family and made an excellent potato garden out of the common land for the maintenance of his wife and children. They will inherit it from him according to the usual Khasi mode. [Genealogy II(c)].

(e) U Roberts who is a Syntong of Jowai, and a Christian by religion (Genealogy V) came to Mawphlong in 1930-31 and after a couple of years married a non-Christian Khasi girl by Khasi rites thereby losing his membership of the church. He cultivated Ri Raid land when he stayed with his wife's mother Ka Shami [Genealogy V]. This woman is of Khar Sohno clan. One of her ancestresses, came to Mawphlong only a few generations ago, and married a man of the old clans. Her descendants have thereby obtained the privilege of cultivating Ri Raid. U Roberts has divorced his wife and no longer possesses this right. He now works as a tailor in the village, and lives with a friend near the bazaar.

(f) Gurdon has suggested that the large number of clans having Khar as the first part of the name of the Kur have originated from ancestresses who were carried off from the plains.

Ik Chattopadhyay 2-4, 5 (no date) 1941 AR7 Khasi AR7

While the traditions regarding the origin of Khar Dumpep and Khar Sohnob collected by me do not support the view that the ancestress came necessarily from the plains, it is clear that they support Gurdon's hypothesis that those clans are derived from ancestresses who came from or settled in certain villages. It is evident that Gurdon's hypothesis implies that the husbands of these women, who brought them home from elsewhere, could clear land and transmit such property to their daughters, although the mother of the daughters did not own any land locally. This right to clear the Ri Raid is therefore not a recent innovation.

I have noted these details here as this aspect of inheritance from males has not been clarified elsewhere. It is not meant of course that this right to clear land extended to the special clan lands or family property matrilenial of the man. As noted before the Kni manages such land and makes over the income or produce to the women who are the owners. Even in such land, however, a man has some rights. Both Gurdon and Cantlie state that a male can adopt a blood relative of the same Kur if all the female members of the particular stock are dead. He himself holds the property for life only, when the women of the line are dead. On adopting a girl of the Kur, she becomes the keeper of the property and also his successor. But "the profits of his labours in the landed property can be used for his wife and children." The inherent right of the male is brought out to a certain extent in this rule also. Such private lands are known as Ri Kynti. It may be of the family or the clan. As an example of family land may be noted the case of the forest of U Nong Sohra, the husband of Ka Jem [Genealogy I(a)]. He cleared some Ri Raid land and planted pine trees there. Only the descendants of Ka Jem can cut trees in this forest which is now practically private property of this group. But the land is essentially Ri Raid in this sense that it cannot be alienated and when all trees have been cut away, any villager will be entitled to occupy it. The Khar Shing Kur as a whole has true private lands near the village. If people of other clans want to cultivate

it, they have to arrange with the U Kni, who is in this case U Babu of Mawphlang, elder brother of the Myntri, U Mama who represents this clan on the State organisation. Payment is made in money which is distributed to the different houses of the Kur. There is, however, Ri Kynti land of another kind, individual property which can be sold absolutely. It may be noted here that no rent is paid to the State or the British Government for the Ri Raid, Ri Kynti or other lands in Mawphlang, or in general in other Khasi States. The revenue of the State is derived from tolls levied on commodities sold in market places and also from fines and other minor sources.

The fundamental social and economic unit among Khasis is therefore the family house and the extended family associated with it; the Kur represents a later stage in its expansion. Marriage sets up new relations but does not disturb this basic structure of Khasi Society.

[p. 20]

SOCIAL GROUPINGS AMONG THE KHASIS OF ASSAM

by Bhabanandan Mukherjee

Dept. of Anthropology, Govt. of India

Calcutta

(Received on 20th October, 1957)

Introduction

[19] [61] [72] [99] [95] THE Khasis, who inhabit the United Khasi and Jaintia Hills district of Assam, are matrilineal. Like the Garos, they are matrilocal in residence. Exclusive ownership over family property is claimed by the Khasi women and the youngest daughter (*Ka Khaddoh*) who lives permanently in the house of her mother, is the custodian of the family property and the holder of religion (*Ka lut ka-siawi*)[1].

[2] This paper deals with the social groupings, namely, the clan, sub-clan and family, of the Khasis. The materials were collected in 1954 from Mawphlang, Cherrapunji and Mawlah and Mawsmai villages farther south of the Chera State.

Discussion

[92] [61] [502] [61] In the language of the Khasi, the prefix *Ka* is usually used before the name of a woman or any object belonging to a woman (or considered feminine). The use of *Ka* as a prefix before the name of each social group is suggested to have bearing on Khasi matriliny. *Kur* is not a very expressive and exact term for a clan. *Kuhar*, which is supposed to have sprung from the woman (*long jaid na ka kyrkhel*)[2] is more exact. Similarly, *Ka-K'pah* and *Ka-ling* denote the sub-clan and family respectively.

---

[1] Gurdon, P. R. T., *The Khasis*, London, 1914 p. 88.

[2] Op. cit., page 88.

brother (actually not likely to happen), the levirate has no sociological implication in the social structure, which is specifically related to the residence rule. The levirate seems to have a significant function only when a marriage is critical—when the husband has full rights over his residence and property. This is also another aspect where the Khasi structure shows a marked difference from that of the Ashanti and the Ila, etc.

VI. Elements of the Rule of Authority of an *Iing*

Among these successful matrial families, there are also shadows of a matrilineal order. These affect especially those men who are in the position of authority in an *iing*. Such a man, though he has an independent household with his wife and children, often visits his youngest sister's (or sister's) house, *iing* (his *iing* sw), and sometimes stays there. Such a man's attachment to his *iing* is not only social or psychological, but also often economic. The man, as authority of his natal *iing*, usually has economic control over the management, particularly so, if his *iing* has considerable property or active trading business. As husband father in his family he works for his wife and children, but often takes into consideration as well the interests of his *iing*. I found such cases especially among richer villagers in Shella and Jaitinga, where the main economic activities were based on trading.

Among the Khasi, it is quite a traditional rule of the division of labour that women engage in trading activities at markets whether on a large or small scale. Husbands may carry goods from field to market, but male members are kept away from the actual scene of the selling and buying. However, these activities on the part of the women are controlled and accounted for by their uncle or brother, or even son (or, if no male member is available, by the husband), though in many cases they form separate domestic families. The man's control over the trade appears more marked when the scale of business is large.

A man of Jaitinga, who worked in a shop in Haflong, spent his salary in keeping his wife and children, but at the same time he kept the accounts of his sister who was a professional merchant. Thus, the economy of the *iing* and that of the co-residential group are crossed by the dual role of the man. Hence, among the Khasi, residential autonomy is not always an indication of economic autonomy. However, it should be clearly understood that a man's acquired property goes to his co-residential group, not to his *iing*.

A man of authority is attached to his *iing* by the stronger ties of religious, social, and economic (management) duties as well as by

The Nayar type. The counter scheme of the Garo type: the co-residential type is "brother-sister" instead of "husband-wife." The function of both line *A* and *B* is equally strong. This type is found among the traditional Nayar (except those in North Malabar) and the Minangkabau matrilineal people.

The Khasi type. The ideal co-residential type consists of a woman with either her husband or her brother. The function of line *A* is much stronger than that of line *B*. This type is found among the Khasi, the Hopi, the Zuni, the Trobiand, the Pagai-Sumatran Malay, the Yao, etc.

The Ashanti type. The ideal co-residential type consists of a man with either his wife or his sister. The function of line *B* is much stronger than that of line *A*. This type is found among the Ashanti, the Gonacha Tonga, the Mayombe, the Tchimanda, the Papua of North Malabar, etc.

In terms of the strong function of both lines *A* and *B*, both the Garo type and the Nayar type may fall into a similar category. But as already explained, their structure basically differs from one another, and clearly appears as the counter schemes of different residential arrangements. The Nayar type shares with the Khasi a rather similar structure in terms of a descent group equated with a property group, while in the Garo type the two lines *A* and *B* of a single descent group never form an independent property unit.

If, leaving aside the Garo type, we consider the three others, the Nayar type appears again different from the rest in so far as in it, both lines fulfill an equally strong function, while in the Khasi and Ashanti types, one of the two lines is always more developed functionally than the other. The Nayar type presents the highest degree of descent group solidarity among the three. This Nayar situation might be compared with that of the traditional Chinese patrilineal systems.[1] In both social systems the structural importance of marriage is minimized: the role of a spouse is only to ensure descendants of the matrilineal (patrilineal) group. The structural importance of a husband (wife) is almost neglected, while the wife (husband) holds the paramount locus in her (his) descent line. The descent group manifests the strongest solidarity within itself, neglecting affinal relations with other groups. This principle results in the custom of the "visiting husband" in the matrilineal system, and, in the patrilineal system, in a total social shift of the wife by her complete assimilation into her husband's group, and separation from her descent group,—she has no social and personal independent locus in terms of the structure. It is an interesting fact that the most extreme scheme of highly institutionalized unilineal systems can be seen among societies of pre-industrialized high civilization. These schemes are structurally opposed to those of the system of the society

1. Fortes touches this point in his paper (Fortes, 1950, p. 208).

divination of the house and of the clans. The little basket is attached to a post in the hut, the special divination of the clan-family are supposed to have their dwelling there; two bamboo twigs fastened underneath symbolize their power. The good bottles are used as containers for the sacrificial drink of rice liquor.(5)

6. CE. Der Hinghiem-Pum./The Hinghiem Pum/, ke ri.

As treasures, which are handed down from generation to generation, are considered the rich ornaments of gold and silver, the heavy chains of coral, and the silk scarves, which are worn by the women at dancing ceremonies.

Also those things which the family has common in the way of furnishings and utensils, such as benches, mats, lances, shields, arrows and bows, and large pots for cooking and for water, earthen containers and bone plates are considered common property of the family.

/1:5b/ The clan mother or the clan has the entire property in her hands, she is the legal and sole guardian and manager of the property. Nothing can be lost even without her permission. No part of either the movable or immovable family possessions may be sold without her agreement. For the execution of the proper legal deed, as she is often ignorant of writing, she must place her fingerprint. Nothing may ever be given away- that would be an insult to the clan divinity since that would not mean treasuring and honoring their property but giving it away as being of no value. As a punishment for that the clan /manum/ would also take its other possessions and then live in poverty and disgrace. The individual members of the clan could sometimes be recruited for work for other clan-families as a kind of slave (mrem). But they may not be taken up in their society as they do not belong to that clan and the clan gods of that family would not permit it. Therefore if, for example, a clan-family has rice fields which they do not cultivate and would gladly give to poorer relatives, they must at least receive the smallest rent as a charge for it. This consists annually of a good bottle of rice liquor, which has the value of about 70 pfennigs to honor the household divinities.

Before the clan mother gives her permission for the sale of common property, she listens to the advice of the other members of the clan. Actually according to the old tribal custom things should be as little sold as given away. It is said that in ages past the original ancestors, whom the individual clans reverence as divinities, apportioned out this their lands of field and wood, and these are supposed to form their unalienable clan property (mangim). To let it get out of one's possession would therefore be insulting the gods. However, that

R Gordon E-4, 5 (no date) 1907 ART Khasi ART

monthly sit. This durbar must not be confused with the 695
electoral durbar which will be referred to later. It is 696
an executive council over which the Siem presides, and
also possesses judicial powers (for a description of a judicial 695
durbar, see page 91 of the monograph). The form of summons 694
to appear before this durbar used to be a knotted piece of
string or cane, the number of knots denoting the degree of
urgency of the summons, not a piece of pork, as one writer has
said. Pork is a luxury which is not usually distributed gratis.
The Siem manages the State business through his ministers, 644
although it is true that in some States the members of the
Siem family have been allowed a considerable share of the
State management. This latter arrangement is, however, a
departure from the ordinary rule in the Siemships, and is
regarded as unconstitutional. In some States there are village 652
headmen, styled Sirdars, who settle cases, collect labour, and 651
assess and receive for the chief the *pynsah*, which may be
literally translated as "gratification." In Nongstoin there is
an official styled *Syngkon*, who is the superior of a number of 650
village sirdars, and who acts as the Siem's deputy-governor. 651
In the Khasi Hills there is no land revenue, nor are there any 648
taxes or other imposts levied upon the cultivator's produce. 623
The land, to a great extent, is the property of the different clans
and villages, although in some instances there are estates owned
by private persons. The chief is entitled to receive the income
that arises from what are known as the *raj* or State lands only.
All that the Siem usually receives from his people in the
way of direct revenue is the State subscription, or *pynsah*,
mentioned above. Even this is supposed to be a voluntary
contribution, and it is not demanded in some States. This
tax is nominally a collection to meet the expenses of the State
entertainments, but is really a means of increasing the chief's
private income. The contributions vary in amount according
to the means of the villagers. The Siem's principal source of 649
income, however, in all the Khasi States is the toll (*khwang*), 651
which he takes from those who sell at the markets in his 443
territory. As the Khasis are great traders these tolls are often
at the larger markets fairly valuable. The chief raises no
excise revenue, the manufacture of both fermented and distilled

1:Gordon X-4, 5 (no date) 1907 AR7 Khasi AR7

614 descended from a common ancestress. There are other instances
C[illegible] of clans being connected with one another, such connection being called by the Khasis *ialik lyer*. Wherever such connection exists, intermarriage is strictly prohibited, and is considered to be *sang*. There is no custom of hypergamy. A Khasi cannot marry his maternal uncle's daughter during the lifetime
[illegible] of the maternal uncle. This is probably due to the fact that the maternal uncle, or *kni*, in a Khasi household is regarded more in the light of a father than of an uncle. His children, however, would belong to the clan of his wife, and there would, therefore, in ordinary cases be no bar to the nephew marrying one of them. Marriage with the daughters of a father's sister is not allowed during the lifetime of the father, but after the father's death there is no religious bar, although such unions are looked upon with disfavour by the Khasis. In the War country, how-
587 ever, such marriages are totally prohibited. A Khasi cannot
588 marry two sisters, but he can marry his deceased wife's sister after the expiry of one year from the wife's death, on payment of *jing sang* (price of *sang*, or taboo) to the wife's clan. A
582 Khasi cannot marry the daughter of his father's brother; she is his *pawn* like (lit. birth sister). Similarly he cannot marry the daughter of his father's paternal uncle. He can, however, marry the daughter of his mother's brother, provided that the brother is dead. This somewhat paradoxical state of affairs is explained by the fact that the children of the mother's brother belong to a different clan to that of the mother, i.e. to the mother's brother's wife's clan. The Khasi, Syntong, War, and Lyngam divisions are not strictly endogamous groups, and there is nothing to prevent intermarriage between them. For instance, it has been the custom in the Nongkhlaw Siem family to obtain husbands for the princesses of the state from the War country. There is no custom amongst the Khasis of two men exchanging daughters, i.e. each marrying his son to
[illegible] the other's daughter. Notwithstanding the existence of the matriarchate, and the fact that all ancestral property is vested in the mother, it would be a mistake to suppose that the father
593 is a nobody in the Khasi house. It is true that the *kni*, or
604 mother's elder brother, is the head of the house, but the father is the executive head of the new house, where, after children

1:Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

The adoption of a female obviates the family dying out (*iap dah*), which to the Khasi is a very serious matter, inasmuch as there will then be no one qualified to place the bones of its members within the family tomb (*ka ka iaing wawbah*), and to perform the requisite funeral ceremonies. Amongst the Khasis no particular ceremonies are performed at the time of adoption; but some of the Syntengs observe a religious ceremony which consists largely of a feast to the *clan-folk*, at which liquor, rice, dried fish, and ginger are partaken of. Before the feast commences, each clansman is provided with a small gourd (*u kiang*) filled with liquor, a little of the latter is then thrown on the ground from the gourd, and the following words are uttered:—

"Oh, God! oh, Lord! oh, ruling king Binkurem, now the *pynsiap iing* ceremony is about to be performed, let the ceremony be propitious, and let males and females (of the clan) increase in numbers, so that the clan may become great, and respected, and that intelligent male members may spring up." No such ceremony is, however, observed, it is understood, in the Nongtung and Ialiang *dolohships*.

In the case of a family being *iap dah* (extinct), the family property, according to Khasi custom, passes to the Siem. Therefore it is to the interest of the members of families to adopt a female, when such necessity arises. As there is no religious ceremony which is compulsory to the Khasis on the occasion of an adoption, perhaps we are almost justified in concluding that in former times the adoption custom did not exist, more especially as the Khasis possess a special word, *iap dah*, for describing a family the females of which have all died out; and it is admittedly the custom for the Siem to succeed to the property of such a family. The Syntengs custom of *'nap iing* may have been borrowed from the Hindus, when the Rajas of Jaintia became converts to that religion.

TENURE OF LAND AND LAWS REGARDING LAND.

Land in the Khasi Hills proper, i.e. land in the high plateau, is held somewhat differently from land in the Jaintia Hills and

Ir Gordon E-4, 5 (no date) 1907 AR? Khasi AR?

the Wiar country, it will be necessary to describe the land tenures and laws regarding land of each of these divisions separately. As land is always *jhumed* by the Khasis and Lyngngams from year to year, customs regarding land with these people are naturally very simple. Taking land in the high plateaus of the Khasi Hills first:—The lands are classified under two main divisions, (*a*) public and (*b*) private lands. The following are the different descriptions of lands in the first division:—

Ka ri Raj, or *ka ri Siem*, which are Siem's, or Crown lands. These lands are intended for the support of the Siem family, and they cannot be alienated. The Siems are, however, precluded by custom from levying a land tax on persons who cultivate such lands, the relation of landlord and tenant between the latter and their chiefs being unknown.

Ka ri Lyngdoh.—These lands are for the support of the Lyngdohs or priests of the State. In some Siemships, as in Mawiang Siemship, paddy is grown on these lands from which rice is obtained for the State pujas.

Ri shnong, or village lands.—These lands are set apart to provide a supply of firewood, thatching grass, &c., and are the property of the village. The inhabitants of other villages are not allowed to enjoy the produce of such lands. Such lands can be cultivated by ryots of the village, but the latter possess only occupancy rights, and cannot transfer them.

Ki Iawkyntang.—These are sacred groves, situated generally near the summit of hills, composed of oak and rhododendron trees, which are held sacred (*kyntang*), it being an offence, or *sang*, for any one to cut timber in the grove, except for cremation purposes. These groves are the property of the villages.

(*b*) Private Lands. These may be subdivided into *ri-bor*, or lands which are the property of the clan, and *ri kynti*, family, or acquired landed property. In the Khasi Hills proper a very large proportion, certainly of the high lands, is the property of the clan; for instance, the high lands at Laitkor, which are the property of the Khar kunger and Kur kulang clans, whose ancestors the large memorial stones close to the Laitkor road commemorate, also the lands of the Thang khew clan, and many others.

1:Gordon E-4, 5 (no date) 1907 ART Khasi ART

• 123 Thang Khiew clan, and many others. It has been explained, 67 in a previous paragraph, how the clan grew out of the family. The clan lands originally, when population was sparse, were owned by families, but as the members of the family increased and a clan was formed, the lands became the property of the clan instead of the family. Such clan lands are properly demarcated by stone boundary marks. The manager of the clan lands is the *doi* (maternal uncle of the youngest daughter of the main family, or branch of the clan), whose house "*ka ring khadduh*," or last home, is the place for performing all the religious ceremonies of the clan, and is also called *ka ring-ong*. All the members of the clan are, however, entitled to share in the produce of any of the clan lands they may cultivate. No clan lands can be alienated without the consent of a majority of the whole clan.

123 *Ki Iyoti* are private lands which have been either acquired
128 by a man or woman individually, or, in the case of a woman, inherited from her mother; such lands must be entirely distinguished from the lands of the clan. In portions of the Jaintia Hills, if a man purchases a piece of land, at his death it passes to his mother, to the exclusion of his children; but in the Khasi Hills nowadays a man may leave such lands, provided they were acquired after marriage, either formally by will, or informally, to his children for their support. In land customs as well as other customs the Syntengs seem to preserve more closely than the Khasis what are probably the ancient usages of the race. It must be clearly understood, however, that all land acquired by inheritance must follow the Khasi law of entail, by which property descends from the mother to the youngest daughter, and again from the latter to her youngest daughter. Ancestral landed property must therefore be always owned by women. The male members of the family may cultivate such lands, but they must carry all the produce to the house of their mother, who will divide it amongst the members of the family. Daughters, other than youngest daughters, are entitled to maintenance from the produce of such family lands.

123 In the Jaintia Hills lands are classified as follows:—

WASTE LANDS OR UNCLAIMED PUBLIC LANDS.

(1) *Raj* lands, which used to be the property of the Raja of Jaintiapur, now the property of Government, which are assessed to land revenue.

(2) Service lands, which are lands given rent free to dolois, pawns, and other officers who carry on the administration.

(3) Village puja lands, being land the occupants of which pay rent to the doloi or lyngdoh, which are set apart in each village for purposes of worship. These lands are not assessed to revenue.

(4) Private lands held by individuals, and which have been transferred from time to time by mortgage sale or otherwise at the will of the owner. These lands are not assessed to revenue.

High lands are sub-divided into (1) Private lands, held like *kali* private lands. (2) Unclaimed land, or Government Waste.

Up till now the Government has not assessed revenue on the high lands which are its own property. Surveys have been made from time to time of the Government *Raj kali* lands in the Jaintia Hills, but the maps require bringing up to date. The revenue on such lands is assessed at an uniform rate, viz. at 10 annas a bighas, and the leases have been issued so as to expire contemporaneously. A list of service lands of dolois and others, showing the number of plots held by each official and their approximate total area in bighas, is kept in the Deputy Commissioner's Office. Puja lands are plots of lands set apart entirely for the support of the lyngdohs and other persons who perform the pujas of the doloships. These lands are generally leased out by the dolois, but in some doloships they are under the management of the lyngdohs. The occupants of the puja lands have either to present annually sacrificial animals or objects, e.g. bulls, goats, fowls, or pigs, rice, liquor, &c., or make a payment in cash. In the War country in the Jaintia Hills, orange, *pân*, and betel-nut gardens, are held as private property except in a few villages where there are some *Raj pân* gardens which have been assessed to land revenue at the same rates as Government *kali* lands. The various gardens are distinguishable by beams of boundary stones or stone cairns, by

1:Gurdon E-4, 5 (no date) 1907 ART Khasi ART

422 prominent trees on the boundary lines, or by natural boundaries such as streams.

423 In the War country to the West of Cherra, notably the country between the heights of Laitkynsew and the plains, considerable portions of the hill-sides are the property of communities known as *ensngs*. A *ensng* may be defined as a collection of families sprung from some common ancestress or ancestor. As an instance of these *ensngs* I may describe the community known as the *lei ensng* which owns land in the neighbourhood of Laitkynsew, the area owned being known as the "*ri lei ensng*," or land of the three clans. These clans are descended from three men, U Kynta, U Nohsin, and U Tangrai, it being remarkable that in this case descent is traced originally from male ancestors and not from females. The three ancestors are said to have owned a large tract of land, and they had as their abode the village of Laitmawrin close to Laitkynsew; but owing to an epidemic, or some such cause, they deserted the village of Laitmawrin and went with their families to live in some of the surrounding War villages, viz. in Tyrna, Nongkroh, Nongrwar, Mawsh, and Mawlong. The descendants of the three men above-mentioned possess a genealogical table, showing their descent from the original three founders of the *ensngs*. They claim a large tract of country lying to the south and south-east of the Laitkynsew plateau, containing not only orange gardens, but also valuable lime quarries. There are other *ensng* communities also in the neighbourhood, e.g. the *Iaiarieu phew ensng*, or sixty *ensngs*, who put forward claims to other tracts of land. The boundaries of the *ri lei ensng* are identifiable on the ground. The business of the *ensng* community is managed by a durbar, an elder or other influential person being chosen as president.

423 In the country of the Lyngngam the crop belongs to the person who cultivates it, but the land belongs to the *kur* or family. The Lyngngam villages, like those in the Khasi Siemships, do not pay any rent to the Siem. If outsiders cultivate within the areas set apart for the different Lyngngam villages, all of them, including women, have to pay eight annas each to the people of the village in whose circle they cultivate. There is usually a mutual understanding between inhabitants of Lyngngam villages that certain tracts of land belong to the

Ii Gordon E-4, 5 (no date) 1907 ART Khasi ART

respective villages; sometimes, however, there are disputes regarding these lands between the different villages. Such disputes are settled by the Lyngdoh Sirdars of villages or by the Sirdars sitting with the two Lyngdohs of the Siemship. If the dispute cannot be settled by these officials to the satisfaction of the parties, the latter are taken by the Lyngdohs and Sirdars to the Siem of Nongstoin, who tries the case with the aid of the State machin.

LAWS REGARDING OTHER PROPERTY.

There is no separate law applying to personal property, as opposed to real property, amongst the Khasis.

METHOD OF DISPUTES.

Khasi Courts of Judicature.

In the first place a complaint is made before the Siem, or chief, against a certain party or parties. The facts and circumstances of the case are then detailed before the chief and his headmen, the ostensible object being to attempt to bring about a compromise between the parties. If no reconciliation can be effected, a crier (*u song pyrta shaung*), or in the Jaintia Hills a *ongpet*, is sent out to proclaim at the top of his voice the durbar which is to assemble the following evening. He proceeds to cry the durbar in the evening when all the inhabitants have returned to the village from their usual daily pursuits. With a loud premonitory yell the crier makes use of the following formula:*—

"*Kum!* thou, a fellow-villager; thou, a fellow-creature; thou, an old man; thou, who art grown up; thou, who art young, thou, a boy; thou, a child; thou, an infant; thou, who art little; thou, who art great. *Hei!* because there is a content. *Hei!* for to cause to sit together. *Hei!* for to cause to deliberate. *Hei!* for to give intelligence together. *Hei!* about to assemble in durbar. *Hei!* for to listen attentively. *Hei!* ye are forbidden. *Hei!* ye are stopped to draw water then

* What follows is a literal translation of the Khasi.

(a) so take such a clan mother with the name Ka Sing Law. She has two
[2b] sons and five daughters, and in addition two brothers and two sisters who are all married. Also each of the five daughters and two sisters has four children. These forty-six people live with the clan mother and form the family clan of the Law. To these we also add the sons
[32] and brothers, the nephews and grandsons, but not their children. The latter have nothing to do with the family Law but belong to the family clan of their wives, live with that clan and are counted to it. Likewise neither the husband of Ka Sing Law, nor the husbands of the various daughters, sisters, nieces, and granddaughters belong here. They are all counted with their own clans, live and work with them according to Khasi custom, and only visit their wives occasionally perhaps after dark.

63 The entire clan-family of Law is housed in 5 or 6 huts, which all
[65] stand next to each other in a semicircle or are built one above the other on the slope of a hill, according to the character of the land. A
[30] garden frequently surrounds them in which maize, sweet potatoes, potato-like roots of lok-ot and lelsor, bananas and, on the southern slopes of the Khasi Mountains, also coffee, pineapples, and other fruits are cultivated. A circle of bamboo cane that is so important for building purposes, household objects, and /18b/ implements surrounds the garden and huts. This bamboo cane grows up so thick so as one to a height of 10 or 15 meters and at the same time forms a good protection against bad weather. A wall (mawtha) of thrown-up earth encloses everything, forming an enclosed farm, prevents unimpeded access, and protects cattle and crops from the attacks and devastations of wild animals.

• 123 What is considered the family property of such a clan? Primarily it is the land, the gardens, the rice fields, woods, fallow mountain and grazing lands. On the southern slopes of the Khasi Mountains there
[29] are fields for the cultivation of rape, orange groves, laurel groves, plantations of betel palms and of pepper leaves which far and wide are so highly treasured for betel chewing as a source of pleasure. (2)

2. Cf. Becker, Im Stromtal des Brahmaputra, /In the River Valley of the Brahmaputra/ (Munich, 1923), pp. 207 ff.

[31] Usually there is so much land available that the family-clan can nourish itself properly and also increase in number

403 According to its size and wealth a family clan also owns a
231 corresponding number of cows, oxen, hens, pigs, and goats. Neither the milk nor the flesh of the cows is used. They are kept for the

667
28 manure, and primarily for breeding, since the sows cannot be dispensed with for the cultivation of the field, especially of the rice field, where the soaked earth must be trampled to a slimy mush. From the fowl the eggs are particularly prized, since they find an almost daily use in the questioning of oracles in cases of misfortune and sickness. (3) Hens, pigs and goats serve for sacrificial purposes,(4)

and they are also a welcome addition to rice at all festive occasions such as snow thanking, (1) at the name giving, /2.3/ at weddings,

> 1. Becker, In Nongmai ex., /In the Valley, ex./, pp. 200 and 207.

and at the cremation of the dead.

621 Further the various huts belong to the family property, the construction and maintenance of which is the work of the members of the clan, the brothers, nephews, and grandsons. The hut of the clan mother is likewise considered the centre of the whole family, and its possession forms the outer sign of the dominance of the clan mother. Here the bulk the family sacrifices and also keeps the special treasures. These are considered to be those things which are connected with the religious cult. Special reverence and sacrifice is due the oldest clan mother, as the original founder of the clan, and her brother in each clan family; in addition there are a series of other spirits which vary according to the family clan. The branch of the Khasi people who live in the Jaintia Mountains, the so-called Synteng, have probably preserved the old Khasi customs the most faithfully. There in the hut of the
78 clan mother are found the following utensils for the service of the
78 divinities, who are nearly always feminine: mats, little baskets for rice, gourd bottles, a little basket made of bamboo cane and decorated with feathers, as well as antlers of deer or antelopes. The latter are fastened to the wall: they are supposed to be the seat of the

his wife and children.

2. Holy Places of Land and Forest

A special kind of land property is still encountered in the Khasi and Jaintia Mountains. These are pieces of land and forests which are considered sang or kynsang, forbidden or holy, thus kyndiu sang, khlaw kynsang, forbidden fields, holy forest. They are also named in connection with the name god, for example, khlaw Siei, forest of the gods, which, to a certain extent, might offer the key to their purpose and meaning. The hands of man are not supposed to disturb this kind of property; this property is sacred to the gods and at the most may be used in their service.

It is not easy to trace the origin and beginnings of these reserves. But several solutions may be found in regard to sections of land. When the /136/ Catholic mission station was founded in the village of Iohelia which is located on a steep mountain slope, it was hard to find a place that was halfway suitable and big enough to build even a small dwelling on it. Finally the missionary discovered such a place somewhat outside the village. But then there was a new difficulty. The place was the cremation area for the dead and therefore was sang /taboo/. The spirits of the dead would punish every intruder severely. The people were finally persuaded to bury their dead somewhere else, but it was more difficult to find any who were ready to help with the work of the building. Even those whom the missionary finally persuaded to help still suffered heavily from the fear of the punishment of the gods and continuously one or the other of them had imaginary illnesses.

In the cases of more extensive pieces of land, the snake worshippers (thlaw), who carry on their dreadful activities in the Khasi Mountains, (9) may offer an explanation sometimes. If such a person is

9. Im Strombal des Brahmaputra, /In the River Valley of the Brahmaputra/, pp. 76ff.

convicted of murder, which he has committed in the service of the snake god in order to sacrifice the blood of the slain person to him, and if he wishes to free himself from the conviction, he can do nothing other than sell all his movable and immovable property. The latter thus becomes sang. Nobody would dare to take over the fields and gardens, to plant anything there, or to touch any fruit on that property. Thus in Cherrapunji a native Catholic was able to take

423 784 possession of a couple of orange gardens which a thien worshipper had abandoned, as the former did not believe in ghosts. (9)

9. Ibid., p. 82.

423 784 797 In the case of all these pieces of ground which are considered sang, the fear of the severe punishment of the gods prevents each owner from building. If another builds, he does not stop him, because he leaves him to the revenge of the insulted god. As may be seen from the case mentioned, the /137/ heathen are at a disadvantage in respect to their compatriots who have turned to Christianity. The latter no longer feel tied to the heathen laws, at least as far as religion is involved and no longer share their fears in many things. Impoverished Khasi Christians thus find an opportunity to acquire land in cases when it would not be possible for a Khasi who is still held captive by animistic beliefs.

But among the latter there are also disgraceful exceptions. In Nonghah, a larger village of the Jaintia Mountains with perhaps 400 huts -- therefore the name, which means large village -- several years ago a heathen observed with a jealous eye how so many pieces of the fallow fields of the gods were changed into fertile lands under the hands of the Christians. The wish grew in him to do likewise. Although he no longer had much fear of his gods, he still had to reckon with the anger and revenge of the members of his clan, if he as a heathen dared to take such a step. They were not likely to dare to do anything against Christians. Without further ado he became converted to the Methodist religion and appeared before the English government official in Jowai, the capital of the Jaintia Mountains, for the transfer of a suitable piece of land. After the revolt of the Syteng in the year 1862, the English government pronounced the whole territory of the Jaintia Mountains to be government land. They also claim the right of bestowal of all free-lying land, usually by a lease of many years. Since the government receives rent for the land, it is in its interest when applicants appear. In this case the deed of conveyance was issued and over the years a flourishing rice field was made from the land that had been useless up to now. Now that the renter was sure of his affairs, he turned his back on the Methodists in order to become a heathen again and to participate in the heathen sacrifices. But then he got into trouble. The heathen were incensed at such a game and brought serious charges before the English government official. He ruled that in the future no piece of ground of that type /138/ should be leased except upon

presentation of the written statement of the chieftain and the village elders that they would have no objection to it. The avaricious renter of the divine land mentioned above was despised by all. 423 734 797

As concerns the holy forests, which often extend picturesquely from the highest peak down the slope and are overgrown with gnarled oaks and bright colored rhododendron, no tree may be felled there; at the most, fallen wood or wood torn down by a storm or already rotten wood may be taken. The spirits of the forest, as punishing gods, will revenge every offense. Tigers and leopards, apes, bears, and snakes enjoy an undisturbed existence here. The only case in which wood may be cut in these divine woods is for the religious cremation ceremonies of the dead. It is the custom of the Khasi to set fire often to great areas in order to fertilize the ground with the ashes of grasses, trees, and shrubs without regard for the new growth of trees, and to make potato fields there for a year or two or to grow mountain rice, millet, or something similar and then to leave the field fallow again. Thus this is a clever precautionary rule, since there might otherwise be cases when there might be no wood for cremating the dead. 778 776 [368] [341]

(Continuation follows)

/306/ Family Property and Maternal Rights
by C. Becker S.D.S., Würzburg

Gurdon says, (10) that these holy groves were formerly the property of a village. That is not always so as the following case will demonstrate. I am also relating this because it grants us a deeper look into the whole customs of the clan under discussion. 779 423 613 771

10. The Khasis, p. 87.

Several decades ago, a Khasi who had become a Protestant, U Jacob Shai by name, was installed as a clerk with the English government official in Jowai. In order to assure his family a better living than just his meager salary, he yearned for land. By birth from Jongshen in the War territory, he remembered that he could obtain his aim in the neighboring village Syndai from the family clan Umlang. So one day he went thither. After the customary greetings, and refreshment with a water pipe and betel nut and conversation about various indifferent matters, he mentioned his desire. "I know," he said in the polite language of even these simple natural men, "I know the goodness and the good name of your clan /Stamm/ and the elders

778
423
613
797

of your clan: you are glad to come to the help of others everywhere and thereby have prepared honor and fame for your whole clan /Sippe/, for your clan gods and goddesses, and for your ancestors of both sexes. You are blessed with grandchildren and great grandchildren. I rejoice in your good fortune and I wish that the gods and goddesses of your clan /Stamm/ will be favorably inclined for all times. Therefore I dare to come to you and to make a request of you: I have only one request: nga don tang kawei ka jingkyrpad! Namely, I need a piece of land, so that I can give my grandsons and granddaughters something to eat. My own field does not suffice for so many mouths. I have noticed that a piece of forest lies here /301/ unused. I have inquired to whom it belongs and the village elders said to me that it was the property of the famous family clan Umliang. I honor you, therefore, and beg you: can I receive this forest according to the law and custom of the clan?"

Questions from the clan mother and the family elders followed this speech. Finally it was clear to them what piece was meant. "That is the khlau sang, the forest of the gods," they cried. "Certainly that belongs to our clan property, but as you yourself know, we can neither rent nor sell it. We cannot and do not even dare say, cultivate the land. But we also cannot prevent you from doing it or forbid you. That piece of land is presented to the gods; they will revenge themselves on anyone who removes it from their cult; they themselves will guard over it so that no one will seize it."

This answer satisfied U Shai completely. He had no fear of the punishment of the forest gods; he had just wanted to make certain whether the family clan would put difficulties in his way or would even bring complaints before the English government. The forest was soon arable. Fire transformed the wood and the bushes, the high grasses and the vines into ashes; oranges and lemons, pineapples, and bananas were planted and after a few years the land brought in from the sale of the fruit a sum, considerable for those conditions, of 800 to 1,000 reichsmarks a year.

The family clan Umliang was still faithful to their native faith. As the other heathen did, so they observed the undertaking of U Shai with fear and anxiety. They believed the gods must bestir themselves and the forest would devour the miscreant with his family. That did not occur. It could not be avoided that in this way the belief in their gods and native customs received a jolt among the heathen and many of them went over to the viewpoint that they might also do it.

After a while a young Khasi with such advanced views married /302/ into the family clan Umliang. Meanwhile 40 years had passed. The old father U Shai was already dead. The piece of land planted by him, as it was not actually family property, according to the special customs of the War had passed on not only to the youngest daughter but also to his son Jacob U Shai and his sisters. On their side they had helped their father in the clearing of the forest. The siblings were Catholic. The young man mentioned above brought a legal complaint against the siblings before the English government official in Jowai a few years ago: the forest made arable by Jacob U Shai and transformed into a fruit orchard had been illegally acquired and is the property of the clan of his wife; he demanded a piece of the land back for the family Umliang and for the other piece a corresponding annual rent must be paid. 778 423 613 797

In reply the siblings Shai could claim that the affair was past the legal time limit. According to tribal custom the time limit on small matters was 10 years, for greater matters 30 years. In addition the main point on their side was that the piece of land in question was khlau sang, forest of the gods, and the family Umliang could not ask anything for it. For this the Shai siblings lacked witnesses, whereas the Umliangs produced several heathen witnesses for the simple declaration of the right of possession. The case was long drawn out. It was finally decided against the Shai siblings and they were declared deprived of the property. The missionary P. Benedikt Neher now concerned himself with the affair. He brought more than 100 witnesses, all clan mothers or village elders, who were ready to swear that that piece of land was a forest of the gods as long as man could remember. The English judge, whom he informed of this, decided that this was a basis for proposing a revision and change of the judgment, but the Shai siblings had lost all their money in the previous trial to pettifogging lawyers and did not have the spirit to begin again. With oriental equanimity they accepted the loss and thus the affair remained.

/303/ The case is instructive anyway, insofar as it shows that the so-called holy forests are also found in the possession of individual family clans; how they are valued by them as long as they remain faithful to their animistic views and how they are able to make their right of possession to them valid even after years.

3. Customs Concerning the Right of Inheritance

When the clan mother dies, the youngest daughter always receives the inheritance among the Khasi. If for any reason the youngest daughter cannot take possession, her next youngest sister follows. If there are 428 613

13:Mukherjee E-5 (1954)1958 AR7 Khasi AR7

of a clan some ceremonial attachment developed out of the custom of depositing the bones of the clansmen in clan ossuary and renewing the relationship between the clansmen on the ceremonial occasion of *thepmaubah* when the bones were finally transferred from *mawshieng* (ossuary of a sub-clan) to *maubah* (ossuary of a clan).

Social bond among the clansmen is due to the performance of common religious ceremonies (*phur*), worship of common deities and spirits of household (*Kwidnia*), water (*puri*) and hills (*Kwidlum*) and observance of mouring for three days for the death of clansmen with the cessation of outdoor work specially with implements.

Economic bond among them is due further to the possession of common land (*ri-kur*), which is divided into separate holdings held by families.

Sub-clan (*Ka-ki'pen*)—Unlike the clan, sub-clan has nothing to do with the regulation of marriage. Its main functions are socio-religious. Mutual interest in the welfare of the members of sub-clan evinced in the observance of *aibam** in honour of the dead grandmother, profund sentiment grown out of the former practice of depositing the bones of the dead persons of the same sub-clan in *mawshieng* and the responsibility of bearing the expenses for *thepmaubah* bind the members together.

The observance of mourning on the death of a person of the same sub-clan for three days and the consequent

*Offering of food to the spirits of the dead ancestors.

I. Setting and Economic Background of Sohkynduh and Kongton

361 Sohkynduh and Kongton are villages of the Kadashinong,[1] one of
632 the areas under the Cherra Chief. The Kadashinong is situated on
[131] the southern slope of the Khasi Hills, in what is called War country. These two villages are situated at the farthest point from both Shella, the centre bordered by the plain, and Cherrapunjee, the seat of the
184 Cherra Chief, one of the centres of the upland Khasi Hills. The people at Cherrapunjee say that these villages are one of the most backward
121 parts of the Khasi Hills. They correspond to Rombagiri in the Garo
[171] Hills, as they lie in the innermost parts and more traditional economic and social settings have been preserved there than in other villages. These are also the reasons why I selected those villages as my field.

361 It is nine miles to Sohkynduh from Cherrapunjee, crossing two deep valleys towards the east. Kongton is located at the heart of
[131] the mountain ranges, ten miles from Cherrapunjee, towards the north-
[487] east. It is about twelve miles from Sohkynduh to Kongton, and the way leads through one of the most difficult passes, where even
[162] villagers seldom travel. In December, 1955, Sohkynduh was a community of 48 households (List 6), and Kongton of 62 households (List 9). The settlements of both villages are clustered in the southern depressions of a mountain, not far from the summit, a typical location
[134] of Khasi villages. Sohkynduh has poor soil, covered with plenty of pieces of stones. The yield therefore is very poor. On the other hand, Kongton, a much older village, enjoys fertile soil, and is one of the most prosperous communities in the Kadashinong.

241 The major economy of both villages is shifting cultivation. We have already seen, in the chapters on the Garo, the fundamental technique of "Jhuming cultivation." The differences between the
423 Garo and the Khasi shifting cultivation are to be found in two aspects: one is the nature of the crops and the other is the type of landowner-
[171] ship. In this area, the main crop is millet, while that of the Garo is
[241] rice. Besides the shifting cultivation, the Khasi have pan-leaf gardens and sometimes pineapple gardens, though on a small scale and not in every household. The most important feature of Khasi shifting cultivation is the development of private ownership. In the tribal areas in Assam, such private ownership of the jhum field is quite an

1. Kadashinong is the name of a group of villages. Its literal meaning is "twelve villages," and it comprises the following villages: Sohkynduh, Rymmai, Mawbawein, Mawshiut, Mawmang, Kongton, Shyntiang, Krohiawhiar, Pdei, Tenshun, Nongpriang, and Diengsaw. (Khasi spelling follows the customary usage in Cherra State.)

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

exception. As I pointed out in the last chapter on the Garo, private ownership started with wet cultivation. In Kongton, there are no common (village) or clan land: every piece of land is owned by some household—more precisely it is owned by the woman, the head of a household, and managed by her brother or maternal uncle. The majority of households in Kongton possesses land. Some of the richer households lend the land while some of the poorer households lease it. The rate for leases is Rs. 90/- per year for an area where one maund (80 lbs.) of millet seeds can be sown. As there is no acreage system, the measurement is by quantity of seeds, and since shifting cultivation requires a change of field every year, the rent is fixed by the year. The pan-leaf gardens, also privately owned, are never leased. When labour is required, the owner engages villagers, paying them Rs. 3/- per day.

In Sohkynduh, there are some lands called "clan land." Throughout the history of the formation of Sohkynduh village, as reconstructed from my data, can be traced some evidence of the evolution of land ownership. The first inhabitants of Sohkynduh were said to be the people belonging to the Prarian clan (See Lists 6 and 7). It seems that when the Prarian came to this site, the land already belonged to the Dkhar clan of Rymmai village, five miles north of Sohkynduh. The present distribution of land ownership confirms this story. The jhum field belonging to Sohkynduh is divided into four sections according to the locality:

1. Lum Sohkynduh
2. Sohliang
3. Mawkhalai
4. Lumpalong

One part of Lum Sohkynduh belongs to the Prarian clan. The rest of Lum Sokynduh, Sohliang and Mawkhalai belong to the Dkhar clan of Rymmai village, the management of which is in the hands of Phrensing who came from Rymmai and married a woman of Sokynduh. Lumpalong is owned by Sor (Kynshah clan, 32 of List 6) privately. The Prarian and Dkhar lands are used by their descendants respectively. The people of other clans have to pay a rent of Rs. 80/- to use these clan lands. For the land which belongs to Sor, even the people of the same clan (Kynshah) have to pay rent since this land is privately owned. Thus the land of Sohkynduh belongs partly to particular clans and partly to a private owner.

Gurdon explains the existence of the clan land in the Khasi Hills as follows:

"The clan lands originally, when population was sparse, were owned by families, but as the members of the family increased and a clan was formed, the lands became the property of the clan instead of the family. Such clan lands are properly demarcated by stone boundary marks. The manager of the clan

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 lands is the *kni* (maternal uncle of the youngest daughter of the main family,
423 or branch of the clan), whose house '*ka iing khadduh*,' or last house, is the place
614 for performing all the religious ceremonies of the clan, and is also called *ka iig seng*. All the members of the clan are, however, entitled to share in the produce of any of the clan lands they may cultivate. No clan lands can be alienated without the consent of a durbar of the whole clan" (Gurdon, 1914, p. 88).

178 Theoretically we can assume that the land was owned by the family
423 (precisely, *iing*, the matrilineal descent group at the lowest segmenta-
428 tion, the structure of which will be discussed later) who first claimed
614 the right to the land, and was managed by the maternal uncle of the youngest daughter, the heiress entitled to the property. In course of time, with the increase of the descent members and with fissions of the descent group, this land was inherited through the youngest daughter's line, but other members who had become segments of the main descent group had a right to use the land, so long as they remained in the same area. Newcomers who belonged to another clan were not granted the same right and had to pay rent. According to the information I was able to collect, even people of the same clan could not claim the right to use the land, unless they were the direct matrilineal descendants of the women who first owned the land. In this sense, the descent group solidarity at a lower level is much stronger than that of the Garo.

Therefore, newly possessed or purchased land is always owned by the individual family (*iing*, descent group). This Khasi conception of land ownership produces a picture of predominant private ownership of land, combined with high geographical mobility of the population (see p. 112). In such circumstances, it seems that even the land called "clan land" has been alienated or sold frequently, and has developed small holdings to suit the small segments of descent groups. In particular, when the entitled owner moved away to another area, the land was sold. For instance, in Sohkynduh, the maternal uncle of Sor (mentioned above) purchased the land indicated above about ten years ago from a family of Siem Lyngngoh who left for another village. This land was originally purchased by the Siem Lyngngoh from the Dkhar to whom the land belonged as part of the clan land.

Under this system, clan ownership of land can develop only (1) when the members of the descent group remain in the same community for a considerable period and (2) when there is sufficient land to acco-
178 modate all members. I think these are the main reasons why land-
423 holding at present among the Khasi is found to be in small descent
428 groups—in one household as in Kongton in most cases, and this I call private ownership. For the second reason, further explanation is

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

necessary. The chances of acquiring a piece of land nowadays are small, except for very successful men, and usually the size of the plot is only just enough to maintain one household. When this land is passed on to the next generation, the youngest daughter will hold the title to it. This fact tends to exclude married elder sisters from the right to use the land, since it is not sufficient for more than one household. Thus the ultimogeniture succession rule seems to have developed more sharply and to have encouraged limited inheritance in conjunction with the shortage of land. 178 423 428

This tendency creates unbalance in the economy of the households within a community. It is a usual picture in Khasi villages, for the bigger and well-built houses to be occupied by the youngest daughter's family, while the elder sisters reside in poor huts. Youngest daughters are usually landowners, while their elder sisters have often to become day-labourers after their marriage, unless their husbands are capable men, or their fathers wealthy enough to give them some share of their acquired property. On the whole, the variations at present between rich and poor are considerable in a Khasi community, in comparison with that of the Garo, where the economic condition of each household in a village is more or less similar. These differences are not only a matter of economic organization but arise from the nature of each social structure. 178 184 423 428 556 [171]

The economic and social patterns of Sohkynduh and Kongton are very similar, but their dialects are slightly different: my interpreter, who came from Cherrapunje, could work quite well at Sohkynduh, but at Kongton he found some difficulty, especially with the speech of the old men, and with their religious expressions. The head man of Kongton, who was quite accustomed to the Cherra dialect, acted as an interpreter for us. Such differences in dialect in the Khasi Hills are common phenomena; it is said that every valley has its own dialect. Differences are found not only in speaking, but also, to a certain extent, in culture and in social usages. 197 [124]

II. Village Endogamy

One of the outstanding features of Khasi social organization is the predominant tendency of endogamy on the level of the village, which contrasts with the structural orientation of the Garo village exogamy. This is closely connected with the distributions of clans and the nature of the descent groups. 582 621 [171]

The Khasi population consists of a number of *kur*, matrilineal clans, whose members consider themselves to be descended from a common ancestress. The members of the same *kur* have a common 614 [765] [769]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

182 very wealthy households still maintain their former economic activities, but
434 the majorit have been impoverihed, becoming daily labourers for the wealthy ones or for road construction. Thus considerable internal economic differentiation has beun to appear in the community.

Thoughthe recent economic depression brought poverty to Jatinga, the
182 standard o living is still strikingly higher than that of neighbouring tribes. Studying sch economic aspects of Jatinga, I wondered at first why these
245 neighbourig tribes have remained as they were, except for temporary employ-
648 ment at Jainga: why, looking at the prosperity of Jatinga, they did not adopt the way ofhe Jatinga people?

Indeed ome of them attempted to imitate the Jatinga economy, but the results wer unfortunately not favourable to them. First, both pan-leaf and orange culvations were entirely new to the tribal peoples, and the technique was quite ifferent from that of dry rice cultivation in the jhum field. Pan cultivationrequires very delicate care which is almost impossible to manage for peoplewho have been accustomed to the primitive jhuming cultivation. For instane, when they go into pan gardens, they have to wash themselves and put o special clean clothes in order to prevent the spread of epidemic leaf diseas Tribal people, who seldom wash their clothes, or mostly go naked, could hardy keep pan gardens. In this respect the Khasi are entirely different, having speialized in this economy for a long period, even as they believe, from time immemorial.

On theother hand, the technique of orange cultivation is much easier than that of pa-leaf, but it takes several years to obtain a yield; it requires considerable capitl to begin with. For the jhum cultivators, who usually did not have cash incone nor funds, it was almost impossible to start it, while the Khasi were ableto raise funds from the selling of the pan-leaf. Furthermore, the
[423] managemnt of such gardens, either pan-leaf or orange, differs also from that of the jhun field as it entirely depends on individual enterprise based on private land ownership, which is new for those tribes where the community owns the land. Therefore the possibility of starting orange gardens is restricted to special individuals among them belonging to exceptionally rich and powerful household. A few households in neighbouring villages did, in fact, start orange gardens, adopting the technique of the Jatinga people. This was around 1942 and they were expecting to have the yield around 1950. However, unfortunately, wher their oranges began to come into production, orange disease started in Jatinga and spread all over these areas. Their dream therefore never came true.

Beside oranges, some of them also established gardens of bananas, jackfruits, and papaas, which were more successful than the oranges. These plantations started much earlier than oranges in this area, though not in great quantity. The prodicts were sold to the Jatinga people who sold them again to Bengalee merchants. The question arises why were they not sold directly to Bengalee merchants, when the profit would have heen much greater.

This aspect of the market economy touches upon very interesting problems
182 concerning the relations between tribal and Hindu peoples. Such tribal peoples who live on a primitive subsistence level usually do not have direct contact
44 with the peoples of the plains. There is always an intermediary between them.
648 In this case it is the Jatinga people who know both tribal life and Hindu life. They are also in between culturally. If a tribal cultivator sells his produce to a Hindu merchant, he would most certainly be cheated by the cunning merchant, as he is quite ignorant of trade. Tribal men do deal with markets directly, but only on a small scale at Haflong bazaar, and without making a profit: it s just the exchange of their basketful of jhum produce for an iron

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi-Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional custom nor a simple blueprint of ill-fitting all-India legislation. The major political schism at this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. [Cf. Gait 1926; Aitchison 1931; Bhuyan 1949; Morris 1910.]

175 619 648 [726] [651] [177] 177 648 [244] [439] [134] [797] [428] [635] [633] [167] [563] [423] [873] 648 642 [651] [563] [113]

SETTLEMENT PATTERN AND HOUSING. **Settlement pattern.** Khasis live sedentarily in named, nucleated, and unplanned villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

361 [312]

16: McCormack E-4,5 (1956-1958) 1964
[P 109 A] AR7 Khasi AR7

clothing, operate the large Khasi business establishments in Shillong, and provide all civic and religious leadership. Women care for children and for the home, do the marketing, and sell dried fish, betel nut, lime, fruits, and rice breads at markets. Other tasks can be performed by either sex. **Land tenure.** Land was formerly divided into sib land and public domain. Sib land was corporately held in perpetuity, and was inalienable except by the unanimous consent of all members of the sib. The public domain was subject to usufructuary right by anyone who kept the land regularly under habitation or cultivation, with a lapse of no more than three years. Most villages grew up on public domain, and then reckoned all land inhabited or under cultivation by a village member as village land. Forests were public, except for sacred groves possessed by villages or lineage groups, and everyone was free to gather branches for fuel. Wastelands and streams were also public. By now, most public domain and village land, together with its forest cover, has been pre-empted as private property and is being rented and sold as such. Sib lands remain intact, unless the sibs agree to rent, lease, or sell. [Cf. Cantlie 1934.]

462 294 443 622 423 [178]

KIN GROUPS. **Descent.** Descent is matrilineal, and the Khasi is a member exclusively of his own matrilineage from birth to death. Adoption, which is very rare, is only within the matrilineage. **Kin groups.** The maximal matrilineage is the sib; this is a named, widely dispersed, strictly exogamous, lineage group, which claims but cannot trace its origin from a single ancestress. Sibs used to meet as corporate groups from time to time. Some sibs are linked with others in large amorphous groups that are unnamed and are defined solely by exogamy. Such a group is composed of two or more sibs, the ancestresses of which are claimed to have been either real sisters or dear friends who out of affection declared that thenceforth their descendants would be as consanguineals. The origin and function of sib-linkage is now unknown, and today the members of a sib will often disagree on whether or not their sib is linked with another. • The minimal matrilineage is the local descent group, or *iing*. This is the largest kin group that normally rallies at life crises. It is said that the *iing* formerly spanned six generations; today, it encompasses only four. If an *iing* grows to more than four generations in a single village, it segments. New houses are located at some distance from the old and the *iing* soon forgets exactly how to trace genealogical connection, except for which segment descended from a youngest sister. The term *iing* may also be applied to an extended family, an elementary family, and a house. The elementary family is the basic domestic unit in Khasi society. In any village there are likely to be one or two households which stand as sole local representatives of the lineage of the female household head. Such a household is known as an

611 [597] 614 602 [59]

241 464 2·10 **Labour and Wages:** It has already been mentioned above that a large number of people subsist on labour—agricultural as well as non-agricultural. Owners of big orchards employ labourers for clearing of their orchards twice or thrice a year, plucking and transporting of produce to markets. Paddy cultivators with large farm engage labourers for ploughing and hoeing of fields, sowing, harvesting and threshing of paddy. It should be mentioned that due to the peculiar agricultural practices prevalent in the district, the input of labourer even for paddy cultivation is higher than that in any of the plains district of the State, which compels cultivators to hire 241 labourer even for small paddy fields. In the case of cash crops, wages 464 are usually paid in cash and for food crops it is paid in cash and kind more usually in kind. Wage rates for males and females are different 465 which generally vary from Rs.1.50 to 1.25 for males and Rs.1.25 to Re. 1.00 for females.

There are, however, numerous instances of engaging agricultural labourers at the rate of Re. 0.50 per day. During the scarcity months the well-to-do farmers advance loans to the poorer section of the people on condition that repayment will have to be made by rendering labour on wage basis at the rate of Re. 0.50 per day in the creditors farms whenever their services are demanded. Thus whenever their services are demanded the poor people haye to work in creditor's farm even at the cost of ruining their own cultivation.

There are other instances where the labourers are paid less then usual wages. In some villages where there is dearth of work all the agricultural labourers gather together at some specified place early in the morning. The well-to-do farmers go there and through bargaining manage to eng ge the number of hands they want at very low rates Similar bidding down of wages of non-agricultural labourers is also. prevalent whenever demand for labour is very low.

Land utilisation and cropping

423 659 2. 11 **Land tenure system.**—The district of United K-J. Hills is not cadastrally surveyed and so far as land tenure is concerned, there is no rigid unifrom or regular system worth the name, with the exception of those lands under the control of the State Forest Department and the Local District Council. There are different kinds of land under different systems, though for obvious reasons no reliabe statistics can be gathered in respect of them. As far as land tenure system is concerned, Jowai subdivision is conspicuously different from Shillong subdivision. However, land in the whole district can be broadly placed under the following categories:—

423 [692] [651] I. **Rikynti or Private land.**—They are private land belonging to certain clans or families but not to an individual according to Khasi custom. Neither Syiem nor District Couucil has got any power over them except the judicial powers to settle any dispute that may arise over any plot of land. The only connection is with the State Forests Department in respect of private protected forests who collects royalty from the produces of these forests if they are used for purposes of

trade. Rikynti are mostly found in the higher hills region—the area between War (southern portion of the district roughly the border area) and Bhoi and constitutes a major portion of the total area of land in Shillong subdivision. In Jowai subdivision private lands are very small in area, only 7,266 acres in total and they are known as 'Biniaj'. 423

II. **Raj Lands.**—They are lands belonging to nobody. It can be said to be a common property which everybody has a right to use, of course with necessary permission from 'Village Raj' in respect of Raj lands under the village or from Syiem in respect of Raj lands under the Syiem. In case of Raj lands the land continues to be in possession of one so long as he cultivates there but as soon as he ceases cultivation it reverts back to the Raj. The land which is known in the official term as unclassed State forests is also Raj land but is under the control of the District Council.

Raj lands are found every where in the district though the major portion is found in Bhoi area and in his area for purpose of cultivation permission is given to any Khasi from any part of the district, while elsewhere in the district, this is confined to the local people only.

III. **Land under Zamindars.**—In War area in both subdivisions here are some big land holders who are locally known as zamindars. There is no record of the number of such zamindaries nor the amount of land held by them. These lands provide suitable sites for cultivation of valuable cash crops like betel-nut, orange, betel-leaf, tezpata and other fruits. The petty landlords are not at all powerful nor it is customary to exploit the tenants. Generally, the landlord leases out of his land on long term basis and the rent is either fixed in cash or in kind and the rate varies according to the fertility of the soil and other conveniences from all points of view On the average the rent per year is 10% of the produce in case of betel-nut, Rs. 40·00 per acre of land per term (usually 5 to 6 years) in case of betel-leaf cultivation and for wet paddy cultivation if the land is very fertile the produce is shared in the rate 50:50 otherwise 1:2 between the landlord and the tenants. For other crops, generally the rent is negligible or nil.

IV. Besides lands under the above main three categories there are also lands which are under control and management of the State Forest Department and the District Council of United K.-J. Hills.

(*a*) **Forest reserve under Assam Forest Regulation VII, 1891.**— There are forests belonging to Government under the control of the State Forest Department. There are five numbers in total, three of them are in Shillong subdivision covering a total area 32,188 acres and two in Jowai subdivision covering an area of 76,961 acres. The total area is 1,09,149 acres, *i.e.*, 170·5 sq. miles. 423 659 648

(*b*) **Forest reserve under executive orders of Government.** These forests are also under the control of the same Department reserved for the purpose of beautification, etc. There are only five of them within the Shillong subdivision and around the town of Shillong The total area covered is 2,635 acres only, *i. e.*, about 4 sq. miles.

423 659 648 (c) **Green Blocks.**—These green forests are private forest but protected and managed by the Department for the purpose of retaining the source of water supply, etc., for the town of Shillong. They are five in number covering a total area of 2·24 sq. miles and located around the town of Shillong itself.

(d) **Private protected Forests.**—There are private forests protected by the State Government for the growth of forests, but the owner can use them provided permission is given by the Deputy Commissioner. There are 16 numbers of them scattered here and there throughout the whole of Shillong subdivision only and covering an area of more than 24·79 sq. miles.

V. In Jowai subdivision there are four blocks of land covering a total area of 44·9 sq. miles reserved for sports and games. They are under the control of the State Revenue Department.

VI. **Raj lands of unclassed State Protected Forests.**—This includes the Raj lands under the District Council mentioned in item 2 above. These forests were formerly under the control of the State Forest Department but are now transferred to the District Council. They are scattered throughout the whole of the district and cover an area of more than 73·05 sq. miles. There are altogether 52 numbers of such forests, 30 of them with an area of more than 57·05 sq. miles and are in Shillong subdivision and 22 numbers with an area of 16 sq. miles are in Jowai subdivision.

423 651 648 2.11.1. **Revenue collected by the District Council (Land Revenue System).**—(a) In Jowai subdivision all the Raj lands mentioned in item 9 above which have been brought under wet paddy cultivation are subjected to payment of annual revenue. The revenues is fixed according to the fertility of the soil. There are three classes—class I hali lands, class II hali lands and class III hali lands, and the revenue varies according to these three classes of lands from Re. 0.50 to Re. 0.87 per bigha per year. There are altogether 28,683 plots covering a total area of 19,709 acres. No such revenue exists in Shillong subdivision.

(b) In both subdivisions there are also lands under special settlement accompanied by revenue.

Shillong subdivision.—An annual revenue is collected for the building site only from Saitsohpen villages, where there are 169 holdings covering a total area of 86 acres with a total revenue of Rs. 505·72 per year.

Seven pieces of land in Burnihat used by the United Fruit Company covering a total area of 182·09 acres. The revenue collected per year is Rs. 550·81. A revenue of Rs. 2. only per year is collected from two building sites at Nongpoh station whose area is 29,861 sq ft.

Jowai subdivision.—An area of 131 acres of land in Lakadong and Satpator Dolloiship and under orange cultivation is also subjected to payment of annual revenue of Rs. 255·44.

There is another 102·21 acres of land in Subacherra in the Indo Pakistan Border which is under tea plantation since prepartition period After partition this area has fallen into India. But at present though tea plantation is still carried on, the revenue has never been collected at all since the company has gone to Pakistan. 423 651 648

There are also in Jowai subdivision 15 numbers of building land sites, mostly leased out to non-Khasi individuals and institutions. They include building for churches, schools, hospitals and training classes, etc. The total area comes to 397·39 acres with a total revenue of Rs.216·84 per year. The period of the lease varies from one plot to another.

A part from land revenue, all the houses in Jowai subdivision are subjected to taxation. The rate is fixed at Rs.2 to Rs.6 per year according to the economic condition of the village. In Shillong subdivision only 31 Sirdarships which were formerly known as British Sirdarships have to pay house tax.

2.12 **Land Utilisation.**—The following table gives the area under important crops. 241 433

TABLE 2

	1958-59	
Winter rice	37,800	acres.
Maize	8,000	"

Orange	20,000	"
Betel-leaf	10,000	
Total	1,18,435	acres.

439 East Pakistan to which the people in the border areas were entitled
648 in the strength of various trade agreements of the Government of
458 India with the authorities in Pakistan, were also scanty. The situation was still more aggravated due to the stringent measures adopted by authorities in Pakistan, on the plea of prevention of smuggling, in December, 1957 when the entire border trade virtually came to a standstill.

245 This chaos in border economy has resulted in widespread unem-
439 ployment among the border people. There being no market for the
458 produce, the owners ceased to take proper care of their orchards and plantations. As a result thousands of labourers who were employed in the
464 orchards were thrown out of employment. Similar was the condition of those who were employed in the transportation of various commodities such as merchandise of trade etc. A large section of the people engaged in collection of limestone were also rendered unemployed with the set back received by the trade in limestone with East Pakistan. Due to stoppage of trans-border trade, petty traders engaged in distributive trade, also suffered.

423 Many of the border people possessing paddy lands and orchards in
648 areas that are located in Pakistan had to abandon them. The following
458 table will show the amount of land lying in Pakistan belonging to the farmer in the selected villages of border area :—

TABLE A-2

Name of villages	Area of land lost through partition		
	No. of familes who possessed land in Pakistan	Area (acres)	Average per family (acres)
1. Nongjri	87	357·86	4·11
2. Shella	9	175·40	19·40
3. Bholaganj	15	108·00	7·20
4. Balat	2	13·50	6·75
5. Mawdon	nil	..	..
6. Lyngkhat	5	85·00	17·00
7. Darrang	16	568·75	35·55
8. Syndai	3	43·33	14·44
9. Amki	8	40·67	5·08
10. Umshnong	nil	..	..

[167] A few families who did not have any landed interest on this side
[65] of the border were reported to have migrated to Pakistan. Most of the families are even now paying tax to East Pakistan authorities even though they are not getting any returns because they do not want to lose their right on land.

It will be seen that wholly agricultural families, in Border area, Project area and General area are 51, 61 and 70 p. c. respectively of the total families. Classifying the wholly agricultural families and families pursuing agriculture as principal occupation, as predominantly agricultural families—the proportion of such families for Border area, Project area and General area stand at 68 p. c. 76 p.c. and 90 p.c. respectively. Thus it is clear that in the Border area the proportion of predominantly agricultural families is the lowest. The reason for this can be safely ascribed to the set-back received due to closure of markets after partition. A close study of tables C·10 and C.11 below and table C.11.1 at the appendix will bear testimony to the fact that in Border area there is evidence of a shift of occupation from agriculture to non-agricultural enterprise especially labour (non-agricultural). 162* 463

Predominantly agricultural families have been classified into five groups— Non-cultivating owner, owner cultivator, tenants, part-owner and part-tenants and landless agricultural labourers. The number of families and the proportion of each of these groups in the three areas are as follows— 125 241 423 427 463

*162
241
• 423

TABLE C·9

Classification of Predominantly Agricultural Families

Type	Border area			Project area			General area		
	No. of families			No. of families			No. of families		
	Shillong Sub-division	Jowai Sub-division	Total	Shillong Sub-division	Jowai Sub-division	Total	Shillong Sub-division	Jowai Sub-division	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Non-cultivating owner..	25 (5·67)	6 (2·61)	31 (4·57)	.. ..	4 (1·25)	4 (0·82)	.. ..	.. ..	...
2. Owner cultivator (owning 75 per cent or more of farm land).	375 (85·52)	98 (42·61)	473 (69·66)	128 (77·58)	175 (54·01)	303 (61·98)	70 (85·37)	64 (77·11)	134 (81·21)
3. Tenant (owning less than 25 per cent of farm land).	8 (1·78)	73 (31·74)	81 (11·93)	14 (8·48)	51 (15·74)	65 (13·29)	3 (3·66)	7 (8·43)	10 (6·06)
4. Part owner and part tenant (owning between 25 per cent and 75 per cent of farm land.	7 (1·56)	19 (8·26)	26 (3·83)	11 (6·66)	21 (6·48)	36 (7·37)	1 (1·22)	5 (6·02)	10 (6·06)
5. Landless agricultural labourer.	34 (7·47)	34 (14·78)	68 (10·01)	8 (4·85)	73 (22·53)	81 (16·56)	4 (4·87)	7 (8·43)	11 (6·67)
Total ...	449 (100·00)	230 (100·00)	679 (100·00)	165 (100·00)	324 (100·00)	489 (100·00)	81 (100·00)	83 (100·00)	165 (100·00)

Apart from private lands, Raj lands possessed by a family and land possessed through settlement by District Council have been considered as 'land owned' for the purpose of this survey. Tenants usually take in rents from land-owners only those lands which are possessed by the later as private land or through settlement through District Council. A perusal of table C 9 given above will show that proportion of tenants are higher in Jowai subdivision which is due to the existence in this subdivision of some big landholders who are known as zamindars. Majority of the families shown against 'non-cultivating owner' are in fact agricultural labour families who also possess some land but due to some reason or other left it uncultivated. Among owner cultivators, tenants and part-owner and part-tenant families also there are some whose major income is derived from agricultural labour. Consideration of these two facts along with the number of landless agricultural families goes to show that the proportion of agricultural labourers in the district is rather high.

CHAPTER VI

LAND

6.1 The total area covered by the sample villages is not available for want of relevant village records as the district is not cadastrally surveyed for settlement purposes. Having no alternative on matters of land and land utilisation pertaining to a family we had to depend entirely on the accounts given by family concerned. However, every care was taken to ensure reliability and in a number of cases accounts of land given by families were verified by actual measurements. In most cases they were found to tally approximately. To simplify matters land referred hereafter relates only to agricultural land.

HOLDING

6.2 "Holding" usually means the land over which the individual or family has permanent and heritable right of occupancy. Due to peculiar land tenure system prevailing in this district, an account of which has already been given in the introductory chapter, this definition had to be modified to fit in with the system obtaining in the district and accordingly the holding of an individual or family was meant to comprise of all lands held as private property or held under Raj System or under settlement through District Council.

The total area covered by land holdings of all sizes in the Border area, Project area and General area samples are respectively 8366.42 acres, 1891.42 acres and 613.24 acres and with 1006, 647 and 184 families in the respective sample. The average size of holding per family works out respectively at 5.3 acres, 2.9 acres, and 3.3 acres in Border area, Project area and General area and holding per head 1.40 acres, 0.63 acres and 0.70 acres respectively. The real situation on the structure of family holding, however, will be better understood from an examination of the distribution of the holdings according to their size as presented in the following table.

*162
423
582

TABLE-D1

Distribution of families by size of Holding Groups

Size of holding group	Border area				Project area				General area			
	No. of families	Average size of holding per family (In acres)	No. of families cultivating land	Average size of cultivated holding (acres)	No. of families	Average size of holding per family (acres)	No. of families cultivating land	Average size of cultivated holding (acres)	No. of families	Average size of holding per family (acres)	No. of families cultivating land	Average size of cultivated holding (acres)
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
1 No land	300 (30·72)	..	..	...	185 (28·59)	...	...	...	19 (10·31)	..	..	..
2 Less than 1 acre ..	82 (8·13)	0·7	71	44·09	59 (9·12)	0·31	56	0·56	19 (10·31)	0·35	19	0·35
3 Less than 3 acres ..	173 (17·20)	1·10	146	1·44	190 (29·37)	1·16	187	1·64	64 (34·78)	1·81	64	1·68
4 3 to less than 10 .. acres	250 (25·64)	3·03	238	4·01	109 (16·12)	5.06	106	4·49	72 (39·13)	5·02	74	4·36
5 10 acres & above	183 (18·09)	19·35	176	11·61	64 (9·90)	13·85	44	10·57	10 (5·43)	12·33	10	9·95
Total no. of families possessing land	697 (69·28)	2·19	631	5·15	463 (71·41)	4·09	453	3·41	165 (89·67)	3·72	164	3·21
Grand Total	1006 (100·00)	3·33			647 (100·00)	2·22			184 (100·00)	3·23		

It is seen from the above table that proportion of landless families was quite high in Border area and Project area accounting for 31 and 29 per cent of the total number of families in the respective area, against 10 in the General area. Considering holdings in general and classifying them as small holdings (if less than 3 acres), medium holding (if 3 acres to less than 10 acres) and large holdings (if 10 acres and above), the proportion of families holding land in the three holding groups is found to be respectively 56 per cent, 26 per cent and 18 per cent in Border area, 67 per cent 26, per cent and 7 per cent in Project area and 55 per cent, 39 per cent and 6 per cent in General area. 1627* 592 423

Considering only the families holding land as will be evident from table D1.1 in the appendix in Border area, the proportions of families in the three holding groups, *i.e.*, small, medium and large are respectively 37%, 37% and 26% of the families holding land while for Project area they are 54%, 37% and 9% and for General area 50%, 44% and 6% respectively.

As to the area covered by the three holding groups in the Border area, Project area and General area, the small holding cover respectively 6 per cent 19 per cent and 21 per cent of the total agricultural land medium holdings cover respectively 28 per cent, 45 per cent and 59 per cent, and the large holding cover 66·32 per cent, 35·50 per cent and 20·42 per cent respectively. Thus in Border area 37 per cent of the families holding land own only 6 per cent of the total agricultural land in the villages while in Project area 54 per cent of the families own 19 per cent in the land and in General area 50 per cent of the families own 21 per cent of total land. As a result the individual holdings under the small holding group are small measuring between 0·24 acres to 2·26 acres in Border area, 0·25 acres to 2·28 acres in Project area and 0·25 acres to 2·30 acres in General area. The average size of holdings per family in the small holding group in the three areas are respectively 1·36 acres, 1·47 acres and 1·55 acres as compared with 5·63 acres, 4·95 acres and 5·02 acres in the medium holding group and 19·55 acres, 15·25 acres and 12·53 acres in large holding group. Average size of holding per family holding land in Border area, Project area and General area comes to respectively 7·70 acres, 4·09 acres and 3·72 acres. However considering cultivated holdings only as will be shown by Table D1.1 at the appendix, the above figures stand at 5·13 acres, 3.41 acres and 3·21 acres respectively crystalising the fact that a considerable portion of land is either left fallow or leased out to others.

The following table will throw light on the point.

*163
241
423
427

TABLE D2

village group	No. of families holding land	Total area of holding (acres)	No. of families renting out land	Area leased out (acres)	No. of families cultivating owned land	Area cultivated (acres)	Area left fallow	Percentage to col. 3
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
1. Border area	697	5366·42	39	251·41	631	3238·66	1876·35	34·96
2. Project area	462	1891·42	27	91·56	453	1543·56	256·30	13·55
3. General area	165	613·24	5	16·75	164	526·45	70·04	11·41

Thus it is seen that of the owned land at least 35 per cent in Border area, 14 per cent in Project area and 11 per cent in General area were left fallow.

Considering the number of families, it was found that in Border area villages as many as 66 families had either totally leased out or left fallow their owned land, the corresponding number for Project area and General area being only 9 and 1 respectively.

TABLE D3

TABLE B3 (*contd.*)

(1)	(2)	(3)		(5)	(6)
*162 241 423 3. General area—					
1. No land	15 (11·72)	1 (2·70)	(11·76)	1 (50·00)	19 (10·33)
2. Less than 1 acre ..	9 (7·03)	4 (10·81)	5 (29·41)	1 (50.00)	19 (10·33)
3. 1 to less than 3 acres	47 (36·71)	10 (27·03)	7 (41·19)	..	64 (34·78)
4. 3 to less than 10 acres	52 (40·63)	17 (45·91)	3 (17·64)	..	72 (39·13)
5. 10 acres and above	5 (3·91)	5 (13·52)	...	... ..	10 (5·43)
Total ..	128 100·00	37 100·00	17 100·00	2 100·00	184 100·00

6.3 It is significant that in all the three areas a considerable section of wholly agricultural families and families following agriculture as principal occupation are landless. On the other hand, a considerable propertion of the families with agriculture as subsidiary occuption or independent of agriculture hold land of various sizes. The fact why agriculture for those families who possessed sufficient land, was reduced to a subsidiary occupation is possibly more due to less return from agriculture than their attachment to it.

FRAGMENTATION

182 311 423 6.4 It has been observed that a large number of rural families have small holdings, the very smallness of which render their holdings un-economic. In addition, the holding of rural families suffer most from the evils of fragmentation. Often holdings are not in compact blocks but are scattered all over and surrounded by lands in possession of others or some uncultivable waste land. Some of the fragments lie even in separate villages.

Unlike in the plains district, fragmentation here was brought about not so much by population pressure (except only in case of wet paddy field) or inheritance legislations or such other factors as would give rise to excessive fragmentation of holdings. This is because there is no settlement regulation and the people are free to reclaim as much of the Raj land as possible for their cultivation. Fragmentation here is thus more a product of the topography of the district, for cultivable land in large compact block is not easy to get and cultivable land have to be found in isolated patches.

The extent of fragmentation is presented in the following table :

TABLE D-4

Distribution of holdings according to number of fragments.

182
311
423

No. of fragments	Border area: No. of holdings	Border area: Percentage	Project area: No. of holdings	Project area: Percentage	General area: No. of holdings	General area: Percentage

19	1		..			..
20	2		...			—
21 & above	0		..			..
Total.. ..	697	100	462	100	195	100

311 The total number of fragments in 697 holding in Border area
423 is 2,540 giving an average of 3.64 fragments per holding, that in
182 462 holdings in project area is 1,080 which gives on the average 2.34 fragment per holding, while in General area 165 holdings comprise of 443 fragments, *i.e.*, 2.68 fragment per holding. A comparison of the above figures with the average fragment figures of 1.61, 4.50, 4.40 and 3.73 per holding in Mikir Hills, Darrang, Sibsagar and Lakhimpur districts respectively goes to show that incidence of fragmentation in this district is higher than that in Mikir Hills but less than that in other districts.

It will be seen from table D4.1 at the appendix that in the small holding group (less than 3 acres) average number of fragments per holding is 1.99 in Border, 1.60 in Project and 2.01 in General area. The average sizes in the corresponding holding group being 1.36 acres 1.47 acres and 1.55 acres, in Border area, Project area and General area, the average size of fragments in the respective area works out at ·68 acres, ·92 and ·76 acres. Similarly it will be seen that average sizes of fragments for medium holding group are, in Border area 1.61 acres (average size of medium holding 5.63 acres) in Project area 1.85 acres (averages size of holding 4.95 acres) and in General area 1.51 acres (average size of holding 5.02 acres), those for large holding group being 3.15 acres, 3.06 acres and 3.49 acres respectively against the average large holding sizes of 19.55 acres, 15.25 acres and 12.53 acres in the respective area.

FARMS

241 6.5 The operating unit in the rural agricultural system is in most
592 cases the family farm. Functions, entrepreneur, capital and manual labour as regards to the agricultural operations in these farms are done through a joint effort of the family unit. Rarely permanent farm servants are maintained though employment of casual labourers are employed during the busy seasons.

[128] In this enquiry a farm has been defined as comprising of all agricultural land operated by a single family with or without employment of labour. The family may or may not have the right of permanent occupancy and inheritance over the farm land operated by it, and in this sense the farm is distinguised from holding which comprises of such land only over which the family concerned possesses right of occupancy and inheritance.

	(78·53)	(7·16)	(6·81)	(7·50)		(85·34)	(14·66)	(100·00)
C. General area—								
Small farms— (less than 3 acres)	126·08	7·25	8·57	9·25	17·82	134·65	16·50	151·15
Medium farms— (3 acres to less than 10 acres) ...	300·07	8·00	7·73	16·86	24·57	307·80	24·86	332·66
Large farms— (10 acres and above)	80·00	—	4·00	8·00	12·00	84·00	8·00	92·00
Total	506·15	15·25	20·30	34·11	54·39	526·45	49·36	575·81
	(87·90)	(2·65)	(3·53)	(5·92)	(100·00)	(91·43)	(8·57)	(100·00)

From the above tables it is evident that for all the areas in each size group small, medium and large, a high proportion of the farms (*i.e.*, in total 76 per cent in Border area, 78 per cent in Project area and 86 per cent in General area) is wholly owned and the area covered by those wholly owned farms also constitutes almost similar high proportions (*i.e.*, 79 per cent in Border area, 79 per cent in Project area and 88 per cent in General area) of the farm area available in the respective village group. Owned area under all farms amounts to 3238·66 acres (83 per cent of the total farm area) in Border area, 1543·56 acres (85 per cent) in Project area and 526·45 acres (91 per cent) in General area. Of this total owned area, in Border area nearly 95 per cent is covered by wholly owned farms and the rest by the partly owned farms. In Project area and General area respectively 92 per cent and 96 per cent of the total owned area are covered by wholly owned farms. Thus the area available for renting in Border area constitutes 17 per cent of the total farm land amounting to 675·52 acres of which 71 per cent is under wholly rented farm and 29 per cent under partly owned farm, in Project area total area available for renting constitutes 15 per cent (*i.e.*, 265·23 acres) of the total farm area of which 49 per cent and 51 per cent respectively are under wholly rented and partly owned farms while in General area 8·57 per cent (49·26 acres) of the total farm area are available for renting of which respectively 31 per cent and 69 per cent are covered by wholly rented and partly owned farms.

It is seen from Table D-7, that total rented area in Border area, Project area and General area are respectively 675·52 acres, 265·23 acres and 49·36 acres. A comparison of these figures with the figures of land leased out as in Table D-2 which are respectively 251.41 acres, 91·56 acres and 16·75 acres in the three areas, goes to show that some of the village lands taken in rent by the villagers belong to some right-holders who live outside the village.

CHAPTER—X

Summary of main findings

125 10.1. Twenty-eight villages were selected for the purpose of the survey. Out of the 28 villages selected, 10 from Border area and 8 from Project area were selected purposively while the remaining 10 were selected at random from the entire district which is referred hereafter as general area.

166 Migration from big villages was rare but some migration was reported in respect of small villages.

164 243 871 489 482 Occurrence of Malaria, influenza and dysentery is a regular phenomenon in the area. Medical facilities were not found satisfactory and as much as 78 per cent of the villages have no dispensary within a radius of five miles. In regard to education, the facilities cannot also be said to be unsatisfactory for more than 60 per cent of the villages have a Lower Primary School. Transport facilities were not satisfactory and as much as 86 per cent of the villages still depend upon primitive mode of transport, namely head load. Correlated with outmoded form of transport, is the prevalence of unduly high cost of transport.

*162 161 10.2. The number of the families covered by the survey was 1006 in the Border area, and 647 in the Project area and 184 in the General area. The average size of a village in the respective area is 100·6, 80·9 and 18·4 families. In the Border and Project areas females out number males being respectively 1076 and 1092 females per 1,000 males as against 940 females per 1,000 males in the general area 212 Literacy is as high as 34 per cent in the border area and 31 per cen [562] in the Project area but as low as 17 per cent in the general area In all the areas literacy among females is very low.

*162 464 The working population (earners and earning dependents) is as high as 55 per cent in the Border area, 54 per cent in the Project area and 63 per cent in the general area. While there were no cases of unemployment in the Project and General areas, 53 persons were reported unemployed from border area.

241 *162 463 10.3. 51 per cent of the families in Border area are wholly agricultural, 35 per cent partly agricultural and 14 per cent independent o agriculture. The corresponding figures for the Project area are 61, 31 and 8 per cent respectively while for the General area they are 70 per cent, 29 per cent, 1 per cent respectively.

Predominantly agricultural families constitute 67, 76 and 90 per cent of the families in Border, Project and General areas respectively.

*162 423 10.4. 31 per cent of the families in Border area, 29 per cent in Project area and 10 per cent in General area were absolutely without any land while 25 per cent, 39 per cent and 24 per cent of the families in the respective areas possessed small holding ranging from 0·24 to 2·30 acres representing 11,24 and 26 per cent of the total holding area in the respective areas. 36 per cent of the families in Border and Project areas and 41 in General area possessed medium sized holding (3 to less than 10 acres)

accounting for 42, 54 and 58 per cent of the total holding area in the respective areas. Large holding (10 acres and above) covering 46, 22 and 16 per cent of the total holding area in the Border, Project and General areas respectively were possessed by 18, 7 and 5 per cent of the families of the respective areas. 162 423

The average size of family holding worked out at 7.7 acres for Border area, 4·1 acres for Project area and 3·7 acres for the General area. The average size of cultivated holding per family in the three areas was found to be 5·1, 3·4 and 3·3 acres respectively.

10.5. The total number of farms in Border area, Project area and General area were respectively 759, 611 and 171 covering respectively 3914·18 acres, 1808·79 acres, and 575·81 acres, bringing the average size of farms to 5·16 acres in Border area, 3·54 acres in Project area and 2·20 acres in General area. 241 311 423

Percentage distribution of these farms and farm area by different size group is depicted in the following table.

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

10.6. Of the total of 719 farms in Border area, 76 per cent were wholly owned, 17 per cent were wholly rented and the remaining 7 per cent were partly owned and partly rented. In Project area, proportions of wholly owned, wholly rented and partly owned and partly rented farms were found to be 73 per cent, 11 per cent and 16 per cent respectively while those in General area were respectively 86 per cent, 4 per cent and 10 per cent of the total number of farms. Of the total farm area, owned area accounted for in Border area 83 per cent, in Project area 85 per cent and in General area 91 per cent of the total farm area in the respective area. Of the total owned area nearly 95 per cent in Border area, 98 per cent in Project area and 99 per cent in General area were covered by wholly owned farms and the rests by partly owned farms. Of the total rented area, in Border area, Project area and General area respectively 71 per cent, 49 per cent and 31 per cent are covered by wholly rented farms. 423 427

10.7. Out of 1066 families in Border area, 650, *i.e.* 61 per cent were indebted, average debt per family being Rs.157·34 nP. and that per indebted family being Rs. 251·25 nP. In Project area out of 647 families 332, *i.e.*, 50 per cent were indebted, average debt per family being Rs. 139·35 nP. and that per indebted family Rs.272·60 nP. In General area out of 184 families, 52, *i.e.* 28 per cent were indebted, average debt per family being Rs. 54·09 nP. and that per indebted family being Rs. 190·00 nP. of the total indebted families. Predominantly agricultural families constituted the highest proportion in all the three areas, being 78 per cent in Border area, 77 per cent in Project area and 98 per cent in General area accounting respectively for 87 per cent, 78 per cent and 99 per cent of the total amount of debt in the three areas. Majority of the loans were of small amount inasmuch as in Border area 60 per cent of the loans are of size less than Rs 200·00, average size of these loans being only Rs. 69·25 nP. In Project area 71 per cent and in General area 72 per cent of the loans are of size less than Rs. 200.00, average size of these loans being respectively Rs. 66·80 and Rs. 99·29 only. Of the total number of loans 67 per cent in Border area, 81 per cent in Project area and 90 per cent in General area were of less than 3 years standing. Majority of the loans in Border and Project areas were found to be incurred for productive purposes. In General area 53 per cent of the loans were contracted for maintenance of the family. 162* 426

Government and other professional and semiprofessional money lenders emerged out to be the predominant sources of rural credit. In Border area loans from Government constituted 82 per cent of the total number of loans accounting for 53 per cent of the total amount of loans followed by those from money lenders which worked out at 15 per cent of the total number of loans accounting for 41 per cent of the total amount of loan. In Project area and General area respectively 60 per cent and 73 per cent of the total number of loans accounting for 70 per cent and 84 per cent of the total amount of loan in the respective area were contracted from private money lenders while Government loans constituted in Project area 45 per cent and in General area 17 per cent of the total number of loans accounting respectively for 30 per cent and 61 per cent of the total amount of loans in the respective area. 426

(9) Cotton is grown on high lands and
248 slopes; it is sown in April, and becomes fit for picking by January.

311 Area and Out-turn of Crops.—According to the Assam Administration Report for 1875-76, the area of the British portion of
241 the Khási and Jaintia Hills District amounts to 2160 square miles,
648 of which only 110 are under cultivation; of the remainder, 1337 square miles are set down as cultivable, and 713 as uncultivable. The total area of the semi-independent Khási States is given as 3997 square miles, of which 176 are under cultivation, 2561 are cultivable, and 1260 uncultivable. In another portion of the same Report, the area under various crops throughout the entire District is thus approximately estimated:—Rice, 39,680 acres; other food grains, 33,800 acres; cotton, 1076 acres; potatoes, 33880 acres. The average out-turn of rice per acre is estimated at 8 *maunds*, or nearly 6 cwt.; of other food grains, 5 *maunds*, or over 2 cwt.; of cotton, 2 *maunds*, or 1½ cwt.; of
[435] potatoes, 55 *maunds*, or nearly 40 cwt. The price of rice in 1875-76 was Rs. 4. 8 per *maund*, or 12s. 8d. a cwt., which gives Rs. 38 or £3. 12s. as the value of the rice crop obtained from one acre.

241 Condition of the Peasantry.—The Khásis can scarcely be considered as agricultural people, as they do not grow sufficient
• 423 grain for their own subsistence, and are dependent to a great
433 extent on imports of rice from the neighbouring Districts. Ten acres is generally considered a considerable holding for a husbandman in the position of an ordinary Bengal peasant, but scarcely any man in the Hills depends entirely upon the produce of his land for
[231] his support. In the Jaintia Hills a cultivator's position is con-
[554] sidered to be very low if he possesses no cattle, but performs all the operations of agriculture with his own hands. In that portion of the District, five acres is all that can be cultivated with a single
(465) pair of oxen, the average being four acres. A husbandman with a holding of five acres would not be so well off as a retail shopkeeper, nor would it enable him to live as comfortably as he could on a money wage of Rs. 8 or 10s. a month. The peasantry, however, as a class are not in debt. The land is owned chiefly by small proprietors, who occupy and cultivate their hereditary fields. The relations of landlord and tenant do not exist in the Hills, and no rent is payable to any one; consequently the principle of Act x. of 1859 (the Rent Law of Bengal) has no application.

231 The Animals used in agriculture are oxen; goats and pigs are
435

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

435 439 [293] 273 435

at the rate of two or three seers for a farthing; and sugar-cane, the cultivation of which is also very limited, at from a little over a farthing to three farthings per cane. A fermented liquor called *kadam*, made from rice, is sold at from three-farthings to threepence a quart, according to strength; and a distilled spirit called *phaikha*, or *kahlad-kawah*, at from threepence to fourpence-halfpenny a quart. This latter description of liquor is sometimes made very strong. No records exist by which the present prices of the above articles can be compared with the rates ruling ten years ago. The maximum price of rice during the famine of 1866-67 was 5 *seers* 6 *chhatáks* for the rupee, or about £1 a hundredweight.

[731]

804 805

MEASURES, WEIGHTS, ETC.—The Hill people have no proper measurement of time or distance. If there be any standard for measuring distance, it is by the number of *pána* a man chews in the course of a journey, generally about one every half hour. In some parts of the District, land is measured by a stick called *ka dingsang*, varying in length from six to seven cubits. Liquids are measured in *gundis* of different measures, varying from half a *chhaták* to a *seer*, and also in bamboo tubes. Rice, potatoes, beans, etc. are measured in baskets, varying in size in different markets from two to eighty pounds.

805

In the Khásí Hills the inhabitants reckon eight days in the week, named as follows:—(1) Lyn-kah; (2) Nong-kmen; (3) Um-long; (4) Kong-hep; (5) Shillong; (6) Pyn-ah; (7) Um-ah; (8) Yun-dah. In the Jaintia Hills the eight days are named thus:—(1) Kylim; (2) Pyn-ing; (3) Mín-long; (4) Mín-ding; (5) Mín-dhai; (6) Pyn-kat; (7) Thym-ísim; (8) Ka-kan. The Khásí months of the year, calculated by moons, are as follow:—(1) U Kylla lyndon; (2) U Rym-pang; (3) U Lyber; (4) U Laiang; (5) U Jimmung; (6) U Jillew; (7) U Nai-ning; (8) U Nai-lar; (9) U Nai-dir; (10) U Rymew; (11) U Nai-wing; (12) U Nob-pnah.

464 423

LABOURERS LOOKING CHARGE.—There is, and always has been, a large class of labourers in the District who neither own nor possess any land. Women and children are employed in manual out-door labour of all kinds.

423 [427]

VARIETIES OF LAND TENURE can hardly be said to exist. There is nothing whatever resembling the relations between landlord and tenant throughout the Khásí Hills. The lands as a rule are either uncovered property or belong to village communities, and are cultivated under unwritten but well-understood agreements. Of the wide

20: Hunter G-4 (no date) 1897 AR 7 Khasi AR 7

extent of waste land, some is cultivated in a manner resembling the *jhum* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *jhumid* tenure. Any renting of land is exceptional, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

Manure is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilised for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 1s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 243 244 [435]

Irrigation for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

Model Farm.—The Shillong Model Farm, established in 1873, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red roughs' and 'pheasant's eye'—were successfully introduced in 1873-74; but these are not looked upon favourably by the Khásis, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the coldness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1744 177 244 648 654 177 245 648 654 [134] [136] 231 648 654

Ir Garden E-4, 5 (no date) 1997 ART Khasi ART

should inherit the property and not men. The rule amongst the Khasis is that the youngest daughter "holds" the religion, "ka lut ka wieu." Her house is called, "ka ding sang," and it is here that the members of the family assemble to witness her performance of the family ceremonies. Here is, therefore, the largest share of the family property, because it is she whose duty it is to perform the family ceremonies, and propitiate the family ancestors. The other daughters, however, on their mother's death are entitled, each of them, to a share of their mother's property, although the youngest daughter gets the lion's share, e.g. the family jewellery, and the family house, and the greater part of what it contains. The youngest daughter cannot dispose of the house without the unanimous consent of her sisters. If the youngest daughter dies, she is succeeded by the next youngest daughter, and so on. All the daughters are bound to repair the house of the youngest daughter free of cost. In the event of the youngest daughter changing her religion, or committing an act of sang, or taboo, she loses her position in the family, and is succeeded by her next youngest sister, as in the case of a death. Failing daughters, inheritance would pass by the "knight's move" to the sister's youngest daughter, who would be succeeded by her youngest daughter, and so on. Failing sister's daughters succession would revert to the mother's sisters and their female descendants. In the Jaintia Hills the inheritance of all real property passes from mother to youngest daughter. No men in the uplands of the Jaintia Hills can possess landed property, unless it is self-acquired property. In the Jaintia Hills, if a man dies and leaves acquired property, his heir will be his mother, if alive, excluding wife, sons, and daughters. If the wife, however, undertakes not to re-marry, she will inherit half of her husband's property, which on her death will descend to her youngest daughter by him.

Amongst Khasis all property which has been acquired by a man before marriage is considered to belong to his mother; indeed it may be said to belong to the man's ior, or clan, such property being called by Khasis, "ka mei ding ior" (the earnings of the house of the clan). After marriage, if there are children, the case is different, provided that the property

[illegible] has been acquired by the man after marriage. Here the wife and children would inherit the acquired property, the youngest daughter obtaining the largest share of such property on the death of the wife. If there were no daughter, the acquired property would be equally divided amongst the sons.

[illegible] The following examples of the Syntong law of inheritance are taken from the exhaustive diaries recorded by the late Mr. Heath, who was for some years Sub-Divisional Officer of Jowai. In the Nongkli dolooiity ancestral land passes from mother to her youngest daughter; again, if a youngest daughter who has no acquired dies, the next youngest in point of age succeeds. Should such direct female succession fail, the family tree has to be looked up for the nearest branch, in which the youngest female, or her youngest female descendant, succeeds. Thus, respecting ancestral land, the youngest daughter, or youngest female descendant of youngest female heir, is virtually heir to ancestral property. If a woman dies having acquired property, her youngest daughter or youngest granddaughter of that youngest daughter succeeds to all. In default, next youngest daughter, and so on. In default of daughters, the youngest son inherits. A man can hardly, in any circumstances, possess ancestral land; his property must almost necessarily be self-acquired. If a man dies having acquired property, his heir will be his mother, if alive, excluding wife, sons, and daughters. If the wife undertakes, however, not to marry again, she will get half, which will descend to her youngest daughter by her deceased husband. The mother, who thus gets the whole or half of her son's property, leaves it to her youngest daughter, or youngest daughter of that daughter, and so on, as described above. In the case of a woman leaving acquired property. If there is no mother, the man's youngest sister female next has with the same right as her mother. If there is no mother or sister, then the sister's female descendants stand in the man's mother's place. If there are none of these, then the woman's youngest daughter succeeds to all. Ancestral property cannot be alienated without the consent of all the heirs in the entail. A gift of self-acquired property to any amount can be made by a donor during his lifetime. Acquired property cannot, however, be left by will out of the course mentioned by

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

Thang Khiew clan, and many others. It has been explained, in a previous paragraph, how the clan grew out of the family. The clan lands originally, when population was sparse, were owned by families; but as the members of the family increased and a clan was formed, the lands became the property of the clan instead of the family. Such clan lands are properly demarcated by stone boundary marks. The manager of the clan lands is the *lei* (maternal uncle of the youngest daughter of the main family, or branch of the clan), whose house "*ka ring Khadduh*," or last home, is the place for performing all the religious ceremonies of the clan, and is also called *ka ring ong*. All the members of the clan are, however, entitled to share in the produce of any of the clan lands they may cultivate. No clan lands can be alienated without the consent of a durbar of the whole clan.

Ki Iyoti are private lands which have been either acquired by a man or woman individually, or, in the case of a woman, inherited from her mother; such lands must be entirely distinguished from the lands of the clan. In portions of the Jaintia Hills, if a man purchases a piece of land, at his death it passes to his mother, to the exclusion of his children; but in the Khasi Hills nowadays a man may leave such lands, provided they were acquired after marriage, either formally by will, or informally, to his children for their support. In land customs as well as other customs the Syntengs seem to preserve more closely than the Khasis what are probably the ancient usages of the race. It must be clearly understood, however, that all land acquired by inheritance must follow the Khasi law of entail, by which property descends from the mother to the youngest daughter and exits from the latter to her youngest daughter. Ancestral landed property must therefore be always owned by women. The male members of the family may cultivate such lands, but they must carry all the produce to the house of their mother, who will divide it amongst the members of the family. Daughters, other than youngest daughters, are entitled to maintenance from the produce of such family lands.

In the Jaintia Hills lands are classified as follows:—

Gordon E-4, 5 (no date) 1907 AR7 Khasi AR7

U lei lingpah—the god of wealth. This god is propitiated with a view to obtaining increased prosperity.

U Syngkew, or a *Bun skeung*, is the tutelary deity of the village. This godling is propitiated by sacrifices whenever they are thought to be necessary.

U Phoo u kyrpad is a similar godling to the above.

Then follows a list of minor deities, or, rather, evil spirits, e.g. *Ka Sih*, the malarial fever devil; *ka Khlaw*, the demon of cholera; *ka Diba*, the fever devil which is said to haunt the neighbourhood of Theriaghat.

Bivar says "the Khasi religion may be thus briefly defined as forms used to cure diseases and to avert misfortunes, by ascertaining the name of the demon, as the author of the evil, and the kind of sacrifice necessary to appease it." We may accept this description as substantially correct. In the Jaintia Hills, there is a peculiar superstition regarding a she devil, called "*ka Tiwah*," which is supposed to cause delirium in cases of fever. When such cases occur, it is believed that "*ka Tiwah*" has caused them, and inquiries are made by means of breaking eggs to find out in whose person the demon has obtained a lodgment; or sometimes the sick person is asked to reveal this. When in either of these ways the name of the person possessed by "*ka Tiwah*" is known, the sick person is taken to the house of the possessed, and ashes and bits of broken pots are cast into the enclosure, after which, if the sick person recovers, the party indicated is denounced as possessed by the demon; but if the patient dies, it is concluded that the person possessed has not been properly ascertained. If people are satisfied that some one is really possessed, they denounce the person, who is then ostracised. The only way for him to regain his position is to exorcise the demon by divesting himself of all his property. He pulls down his house, burns the materials, his [illegible] cows, pigs, and fowls are sold, the money realised by the sale being thrown away. No one dares touch this money, for fear he should become possessed by *ka Tiwah*. It will be observed that, as in the case of the *thlaw*, the demon is believed to follow the property.

Mr. Jenkins, in his interesting little work on "Life and

[illegible] division of the forest and of the clans. The little basket is attached to a post in the hut; the special divinities of the clan-family are supposed to have their dwelling there; two hazelnut twigs fastened underneath symbolize their power. The gourd bottles are used as containers for the sacrificial drink of rice liquor.(6)

6. Cf. Die Hunglawan-Puja, /The Hunglawan Puja/, loc cit.

[illegible] As treasures, which are handed down from generation to generation, are considered the rich ornaments of gold and silver, the heavy chains of coral, and the silk scarves, which are worn by the women at dancing ceremonies.

Also those things which the family hats contain in the way of furnishings and utensils, such as baskets, mats, lances, shields, arrows and bows, and brass pots for cooking and for water, earthen containers and brass plates are considered common property of the family.

[illegible] /130/ The clan mother at the time has the entire property in her hands, she is the legal and sole guardian and manager of the property. Nothing can be lent even without her permission. No part of either the movable or immovable family possession may be sold without her agreement. For the execution of the proper legal deed, as she is often ignorant of writing, she must place her fingerprint. Nothing may ever be given away: that would be an insult to the clan divinity since that would not mean treasuring and honoring their property but giving it away as being of no value. As a punishment for that the clan /members/ would also lose its other possessions and then live in poverty and disgrace. The individual members of the clan could sometimes be recruited for work for other clan-families as a kind of slave (mong). But they may not be taken up in their society as they do not belong to that clan and the clan gods of that family would not permit it. Therefore if, for example, a clan-family has rice fields which they do not cultivate and would gladly give to poorer relatives, they must at least receive the smallest rent as a pledge for it. This consists usually of a good bottle of rice liquor, which has the value of about 70 piastres to hence the household divinities.

Before the clan mother gives her permission for the sale of common property, she listens to the advice of the other members of the clan. Actually according to the old tribal custom things should be as little sold as given away. It is said that in ages past the original ancestors, when the individual clans separated as divisions, apportioned out this their lands of field and wood, and these are [illegible] to dependent unsalable clan property (mangkin). To be to get rid of [illegible] would therefore be insulting the gods. However, that

uld not prevent individuals from becoming needy through misfortune 431
laziness and their trying to rent a part of their property for an annual 425
yment or for a sum needed once. This is called han dia pan, liter-
ly: begging to buy. The sense of relinquishing by lending /133/ is
ntained in this. For example, a field is worth 300 reichsmarks.
fty or 100 reichsmarks are accepted for it and the creditor remains
e owner of the field until the money is repaid. This type of pur-
ase occurs frequently. There are frequently traders (nonghuli)
o try to use such purchases to their own advantage. They turn over
e field to the debtor for further cultivation in return for payment in
ndure of 50 to 70 per cent of the harvest. After several years the
hole field is their property. Aside from this method, it also happens
at instead of being able to repay the money the people need still
rther sums. In that case then the entire price of 300 reichsmarks is
id and the actual purchase is considered completed; that is called
n dia lut; literally: totally, completely sold. A family-clan which
adually loses its property in this manner descends into poverty and
ed. There is nothing else for it to do than to look for work else- [540]
here, to rent land or to sell the children as a kind of slaves to better
ntered people. If 40 reichsmarks are paid for a child of about 10
ars, he remains in the bondage of the buyer until the money can be
paid. That happens only rarely. Besides food and the most necess-
ry clothing only one rupee is deducted annually as wage from the
rchase price; thus, practically, the child belongs to the buyer for
e duration of his life.

It is the duty of individual members of a family clan to work to- 423
ether so that the clan property will be maintained and will produce 424
e necessary amount for the maintenance of all. The clan mother
ust counter primarily that the appropriate customs and usages are
bserved. She is held in high esteem by all. To do something
gainst her wish to offend her, to call her insulting names, or to go
far as to strike her is considered sang (taboo), a severe crime that
ntails misfortune. It is a great sin (pap) and a thoroughly great dis- 423
ace (ongrowith ch tum) for the whole clan.(7) As long as a member 424
762

7. Also considered similar crimes are selling clan property in secret, incest, desecrating burial places in a coarse manner, making use of holy grounds or woods.

136/ of the family has committed such a crime and has not begged
rdon from the clan mother and the elders of the clan, perhaps with
e words: pardon me, I have committed an error (ne mop ia nga leh

Because of her whole position as guardian of the inherited religion and customs, it is not frequent that such a woman breaks with the ancestor cult. If this does happen, it does not necessarily mean that she loses the entire property. That depends really on the position the other members of the family take. If they are all still firm heathens, who wish to have nothing to do with Christianity, they can force the clan mother to give everything up. The high respect for her is frequently so great, however, that either the whole clan or at least a part of it decides to take the same step and change religions with the clan mother. The part that remains heathen will certainly propose a division of the family property. This is also possible in other cases.

4. Division of the Family Property.

Although it is rare, the weal and woe of a family-clan can require that a family-clan be split into two clans /Clan/ and that a division of the common property be undertaken. The basis for this is if the family /Geschlecht/ becomes too big, if the elders in the family council /Rat/ are no longer united and hate and revenge threaten to destroy, if a part of the clan /Clan/ tries to seize the better fields by violence and refuses to deliver the harvest for the common need, if one branch has brought the whole clan /Sippe/ dishonor and shame by false oaths, incest, revenge, treachery or some other severe crime. Only the guilty party will be excluded from the clan /Clan/ in such cases, if he remains stubborn and impenitent. But if he begs for forgiveness with his lips and participates in the expiatory [illegible], forgiveness will not be refused him. But a certain inner tension and bad feeling often remain behind.

At the conversion to another religion, it often depends on how the clan mother and also the family elders are inclined towards the religion in question, and also on who is changing religions. If it is only brothers, sons, nephews, or grandsons, of the clan mother, a division is out of the question, since the men are not capable of inheriting. But if it is the youngest or next youngest daughter or even the sister of the clan mother, then a division of property can be undertaken. A clan mother after all is so attached to her child or her nearest blood relatives that she would not like to push them entirely away from herself unless she were completely set against the religion in question and angered. If that should be so in individual cases, the heirs concerned will still consider, whether it is not more advisable to wait to change her religion until the clan mother has closed her eyes and she then has free play. Then that which was mentioned at the conclusion of the previous section can occur.

If after discussions lasting weeks all the problems involved have been settled, the agreements decided on are finally completed with the customary ceremonial. It was mentioned above, what objects for the religious cult are to be found in the hut of the clan mother. The little basket plaited of bamboo cane, which is considered the special seat of the divine ancestors of the clan. /Clan/ is not divided. /300/ Another, similar basket is made. By sacrifice of goats and pigs, these divinities are then entreated so that a part of them may take up their dwelling in this basket for the protection of the newly constructed clan. If the sacrificial priest can announce the agreement of the deceased spirits with the division from the oracle of the entrails of the animals and by egg throwing, then this basket is brought to the new clan hut. On another day one of the two hearthut poles is then taken for the new hut with further sacrifices. Each of the two separated parties must fetch a new pole to go with the other one. In a like way the existent sacrificial utensils, such as rice baskets, mats, and gourd bottles are divided. With this ceremony the agreements made about the division of the other property are considered legally existent. Each party now goes his own way independent of the other. Certain relationships of friendship and kinship still remain in existence; however, the bar to marriage, which otherwise would make impossible the marriage between members of the same family clan without regard to the degree of relationship, is no longer in existence.

If, as the conversion of one part of the members of the clan to the Christian religion, the division of property can be accomplished legally, it is better to insist on it. The members who have become Christian are more readily protected from disadvantageous treatment. Even if they should take part of the fields for themselves in separate management, the part of the clan that remained heathen could demand this back years later. Enmity, hate, and revenge would then follow. Without the formal ceremony combined with the sacrifices mentioned a Khasi does not recognize a division as legal. Since Christians cannot participate in such a sacrificial ceremony, there is nothing to do other than to have this ceremony undertaken while those seeking to be baptized are still catechumens. Before they are accepted then into the church by baptism, the heathen cult objects that were brought into the clan hut must be removed. "To /300/ this most important ceremony, "the missionary of the Synong territory, P. Benoître Maher S. D. S., once related, "I usually went myself if it was possible for me to or sent a European sister of the Order. Thereby the ceremony acquired a great deal

[See category 16, pp 25 — Analysis]

more solemnity and had a powerful effect on the heathen and the catechumens. The basket of the gods, the two sticks, the gourd bottles, and the other objects of the cult were carried to an open place in front of the hut, placed on a pile of bamboo canes and wood and then lighted by fire. The heathen stood at a respectful distance, fearful and trembling, and expecting that the gods would revenge themselves and destroy me with fire from heaven. But nothing of the kind happened, and disappointed and thoughtful they went back to their huts. The clan hut would then be blessed and sprinkled with holy water.

In general the Christian religions strive to settle their members in a village separated from the heathen clan members, and to settle them in such a way that the separate family clans remain together when possible. The christian customs, that husband, wife, and children then live together in one family is carried out when possible but, however it is not always done without difficulties in view of the traditional customs.

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

about Rs. 30. The price of lac has risen a good deal of late years. Formerly the price was about Rs. 15 to Rs. 20 a maund. The lac trade in the Jaintia Hills and in the southern portion of the Khyrim State is a valuable one. The profits, however, go largely to middle-men, who in the Jaintia Hills are Syntengs from Jowai, who give out advances to the Bhoi cultivators on the condition that they will be repaid in lac. The Marwari merchants from the plains attend all the plains markets which are frequented by the hill-men, and buy up the lac and export it to Calcutta. The whole of the lac is of the kind known as stick lac.

HUNTING.

The weapons used by the Khasis for hunting are bows and arrows, the latter with barbed iron heads, and spears which are used both for casting and thrusting. Before proceeding on a hunting expedition the hunters break eggs, in order to ascertain whether they will be successful or not, and to which jungle they should proceed. Offerings are also made to certain village deities, *e.g. U. Ryngkew, u Ioon*, and *u Bam ki ondi*. A lucky day having been selected and the deities propitiated, the hunters start with a number of dogs trained to the chase, the latter being held on leading by a party of men called *ki sangni-kam*. When the dogs have picked up the scent some hunters are placed as "stops" (*ki ktem*), at points of vantage in the jungle, and the drive commences with loud shouts from the hunters, the same being continued until the object of the chase breaks into the open. The man who draws the first blood is called *u sangniat*, and the second man who scores a hit *u sangkon*. These two men get larger shares of the flesh than the others. The *sangniat* obtains the lower half of the body of the animal, thighs and feet excepted, called *ka tlang*, and the *sangkon* one of the forequarters called *ka tulla*. The other hunters obtain a string of flesh each, and each hound gets a string of flesh to itself. These hunting parties pursue deer sometimes for many miles, and exceedingly fatigable in the chase, the latter lasting occasionally more than one day. In the Jaintia Hills, at the end of the chase, the quarry is carried to

CHAPTER VII

Rural Indebtedness

[illegible] 7.1. As Rural indebtedness is a problem of great importance we have attempted below to crystallize the extent of indebtedness in the rural areas of the district. During investigation account was taken of all loans of which [illegible] a part was outstanding on the date of investigation.

7.2. The following table shows the number of indebted families in the three village groups :

TABLE E-1

Number of indebted families and amount of loan outstanding in the three areas

Village group	Total No. of families	No. of indebted families	% of indebted families	Amount of loan outstanding (Rs.)	Average amount outstanding per loan-fly (Rs.)	Average amount outstanding per indebted family (Rs.)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Border area	[illegible]	[illegible]	67	[illegible]	[illegible]	[illegible]
Project area	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
General area	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

Thus 67 per cent of the families in Border area, 58 per cent in Project area and 38 per cent in General area are indebted, the average amount outstanding per family in the corresponding area being Rs. [illegible], Rs. [illegible] and Rs. [illegible] respectively. All these prove beyond doubt the rural indebtedness in the district is high. It will be seen from a subsequent table that Government loan constitute the largest portion of the total amount of loan in these Border area villages. It will also be seen that per family indebtedness is highest in Project area. This is, however, apt to be inflated in view of the fact that from Project area, villages where intensive development activities were taken up [illegible] were selected. Villagers participated in various various kinds of loans from Project. Loans were taken both in cash and kind. Kind loans, however, were not frequent. It was found that value of kind loan constituted only 2 per cent, 19 per cent and 22 per cent of the total amount of loan in Border area, Project area and General area respectively. Kind loans are usually taken as follows :

[illegible] Firstly when agricultural produce fails to meet the annual requirements of the people they resort to grain loans. Secondly, some Government loan, particularly agricultural loan disbursed by Project area, are given partly in cash and partly in kind.

7.3. As a study of the occupational distribution of these indebted families may be useful, in the following table, indebted families are classified according to their principal occupation.

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

TABLE E-2

Debtor by principal occupation

Principal occupation	Total No. of families	No. of indebted families	Amount of loan outstanding (Rs.)	Average amount outstanding per indebted family (Rs.)
(1)	(2)	(3)	(4)	(5)
A. Border area :—				
1. Agriculture	[illegible]	[illegible]	[illegible]	[illegible]
2. Labour	[illegible]	[illegible]	[illegible]	[illegible]
3. Service, Professions, etc.	[illegible]	[illegible]	[illegible]	[illegible]
4. Trade	[illegible]	[illegible]	[illegible]	[illegible]
5. Small scale manufacture and handicraft	[illegible]	[illegible]	[illegible]	[illegible]
6. Poultry and dairy farming, etc.	[illegible]	[illegible]	[illegible]	[illegible]
7. Others	[illegible]	[illegible]	[illegible]	[illegible]
Total	[illegible]	[illegible]	[illegible]	[illegible]
B. Project area :—				
1. Agriculture	[illegible]	[illegible]	[illegible]	[illegible]
2. Labour	[illegible]	[illegible]	[illegible]	[illegible]
3. Service, Professions, etc.	[illegible]	[illegible]	[illegible]	[illegible]
4. Trade	[illegible]	[illegible]	[illegible]	[illegible]
5. Small scale manufacture and handicraft	[illegible]	[illegible]	[illegible]	[illegible]
6. Poultry and dairy farming, etc.	[illegible]	[illegible]	[illegible]	[illegible]
7. Others	[illegible]	[illegible]	[illegible]	[illegible]
Total	[illegible]	[illegible]	[illegible]	[illegible]

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

Principal occupation	Total No. of families	No. of indebted families	Amount of loan outstanding (Rs.)	Average amount outstanding per household (Rs.)
(1)	(2)	(3)	(4)	(5)
C. General area :—				
1. Agriculture ...	165	51	9,594	188.02
2. Labour ...	6	1	100	100.00
3. Service profession, etc.	2	...	...	...
4. Trade ...	4	...	...	...
5. Small scale manufacture and handicraft.	1	...	...	...
6. Pottery and clay forming, etc. ...	2	...	...	...
7. Others ...	...	...	...	...
Total ...	184	52	9,594	184.50

From the above table it will be seen that predominantly agricultural families constitute the highest proportion of the indebted class in all the three areas. In Border area they constitute 71 per cent of the total number of indebted families, accounting for 87 per cent of the total amount of loan. In Project area and General area these proportions were respectively 77.5 per cent, 92 per cent and 95 per cent. It is clear that in Border area, average amount of loan per family is higher of the non-agricultural class which ranges from Rs. 877.00 to Rs. 1,400.00 as. These amounts, as a matter of fact were inflated due to inclusion of a few families in such class who have very high amount of outstanding loan ranging from Rs. 6000 to Rs. 10,000 per family. Otherwise indebtedness in agricultural and non-agricultural class did not manifest any wide difference. In Project area, indebtedness among agricultural families is definitely higher than that among their counterparts in Border area and they accounted for a far proportion 92 per cent of the total amount of loan. Different occupational groups in non-agricultural class, of course, revealed among themselves wide variation in average per family indebtedness ranging from Rs. 89 to Rs. 972 per family. On the other hand, in General area, agricultural families account for almost the entire amount of loan.

Per family indebtedness taking all the families into consideration stands at, for Border area Rs. 187.34, for Project area Rs. 188.85 and for General area Rs. 50.00.

7.6. As has already been mentioned, the average debt per family worked out above does not reflect the true picture of indebtedness in the areas. The following table is illustrative.—

TABLE 5-3

Distribution of loans in different amount groups

Loan group (Rs.)	Backward area			Project area			General area		
	No. of loans	Amount (Rs.)	Average (Rs.)	No. of loans	Amount (Rs.)	Average (Rs.)	No. of loans	Amount (Rs.)	Average (Rs.)
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Below Rs. 100	440	13,[illegible]	[illegible]	848	41,[illegible]	[illegible]	37	403	[illegible]
	(41)	(1)		(49)	(10)		(38)	(8)	
2. Rs. 100 to below 500 ..	497	32,[illegible]	[illegible]	814	[illegible]	[illegible]	38	[illegible]	[illegible]
	(46)	(3)		(47)	(41)		(39)	(41)	

TABLE [illegible]—*concld.*

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
B. Rs. [illegible] to below [illegible] ...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	(2)	(1)		(20)	(10)		(20)	(10)	
C. Rs. [illegible] to below 1,000 ...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	(4)	(1)		(1)	(10)		(1)	(1)	
D. Rs. [illegible] to below 2,000 ...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	(1)	(1)		(1)	(6)		(1)	(1)	
E. Rs. 2,000 and above ...	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	—	—	—
	(1)	(10)		(1)	10	—	—	—	—
Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	(100)	(100)		(100)	(100)		(100)	(100)	

From the above table it is clear that majority of the loans are of small amounts. In Sunder area as many as [illegible] per cent of the loans are of size less than Rs. 500 (average Rs. [illegible]) covering only 29 per cent of the total amount of loan. The corresponding figures for Project area are 71 per cent (average Rs. [illegible]) and 27 per cent and for General area [illegible] per cent (average Rs. [illegible]) and 10 per cent. Thus in Sunder area there were [illegible] big loans ranging from Rs. [illegible] to Rs. [illegible], in Project area [illegible] big loans ranging from Rs. [illegible] to Rs. [illegible] and in General area [illegible] big loans ranging between Rs. [illegible] to Rs. [illegible] (with loan [illegible] weighs in making the average figures of per family indebtedness).

7.3 It has been observed that majority of the loans are of diminishing periodicity there in Project area and General area. The following table will be illustrative.

TABLE E-4

Period of Repaying of loans	Border area		Project area		General area	
	No. of loans	Amount of loan (Rs.)	No. of loans	Amount of loan (Rs.)	No. of loans	Amount (Rs.)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Less than 5 years	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. 5 to less than 7 years	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. 7 years and above	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

Thus in Border area, Project area and General area respectively [illegible] per cent, [illegible] per cent and [illegible] per cent of the total number of loans in the respective area were contracted during the three years preceding the enquiry respectively covering [illegible] per cent, [illegible] per cent and [illegible] per cent of the total amount of loans in the respective area. In Border area out of [illegible] loans, [illegible] number of loans ([illegible] per cent) were of more than 5 years standing, the corresponding figures for Project area and General area being [illegible] (i.e., [illegible] per cent) and [illegible] (i.e., [illegible] per cent). A comprehensive analysis of the component parts of these loans will be found in Table E-6 at the appendix.

7.6 The purpose for which the loans were sanctioned and different sources of loans are summarised in the following table :—

TABLE 7.6

Loans by source and purpose

Source	Co-operative Agriculture bank		Other Government bank		Co-operative non Agricultural		Money lender village Mahajan		Owner of land		Others		Total

A glance at table above, shows that families concerned have for productive as well as reproductive purposes, the bulk of them apparently being for productive purposes. In Sorbor area out of 1081 loans, as many as [illegible] loans (79%) accounting for 48% of the total amount of loan were incurred for agricultural purposes other than purchase of land and draught animals followed by [illegible] loans (19%) accounting for 28% of the total amount for other purposes which included some Government loan such as Relief and Rehabilitation loans, etc., and other loans taken from private persons for meeting medical expenses which is considerable in Sorbor area and other occasions. Next to it in order of importance come the loans for normal maintenance and for running household expenses, the number in respective loan being [illegible] (8%) and [illegible] accounting for 7% and 12% of the total amount of loans. Individually loans for running household expenses are of biggest amount, being Rs. [illegible] on the average.

Though the majority of the loans were incurred for productive purposes, action given by the loanees during enquiry, suggest that the major portion of these loans was spent on normal maintenance. This was particularly the case with Government loans given in Sorbor area.

In Project area out of a total of [illegible] loans, [illegible] loans (10%) were contracted for agricultural purposes covering 31% of the total amount of loan, followed by loans for normal maintenance and for other purposes, number of loans in the respective categories being [illegible] (30%) and [illegible] (33%) accounting respectively for 4% and 27% of the total amount of loan.

In General area out of a total of [illegible] loans [illegible] (32%) were incurred for normal maintenance accounting for 31% of the total amount of loan. Next come the [illegible] loans contracted for agricultural purposes which accounted for 27% of the total amount of loans again followed by [illegible] loans taken for other purposes accounting for 16% of the total amount of loan.

7.7 These loans were, as will be seen from the above table, taken from various sources. In all the areas, however, Government and money lenders outstripped the other sources. In Sorbor area, for example, Government loans constitute 42% of the total number of [illegible] loans accounting for 42% of the total amount of loan, followed by loans from money lenders and Mahajans which constituted 27% of the total number of loans and covered a comparatively much higher proportion (47%) of the total amount of loans pointing to the significance of individual loans. Next to these are the loans from other sources which included friends and relatives, followed by those from owners of land.

In project area loans from private money lenders constituted 37% of total number of loans [illegible] covering a little less than [illegible] (70%) of the total amount of loan, followed by Government loans for which the corresponding figures are 27% and 20%. The remaining [illegible] of the total number of loans accounting for [illegible] of the total amount are taken in order of importance, from owner of land, Co-operative Societies and 'other' sources.

In General area out of a total of 48 loans 38 loans (79%) amounting for [illegible] of the total amount are from money lenders followed by 23 loans from Government and five loans from owners of land accounting respectively for 11 per cent and 9% of the total amount.

Thus it is seen that money lenders are still holding sway among the poor people in the rural area.

7.3 The following table summarises the position with regard to the interest borne by different parts of the rural debt. The calculation of rates of interest presents difficulties in the case of loans taken in kind or in cash on condition of selling the crop after harvest to the creditors or rendering labour at less wages at creditor's farm during busy agricultural season. In case of such loans the interest rates given here are as ascertained on the basis of the information furnished by the debtor regarding the amount of produce to be given to the creditor, or number of man-days worked on creditor's farm in repayment of principal and interest.

TABLE 5-6

Debts classified according to rate of interest

Rate of interest	No. of loans	P. C. to total no. of loans	Amount (Rs)	Percentage to total amount of loan	Average amount of loan (Rs)

9. 200 per cent and above					
Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

It is seen that proportion of interest free loans are [illegible] per cent in Border area accounting for [illegible]% of total amount of loan, [illegible]% in Project area which cover [illegible]% of the total amount of loan and that in General area being [illegible]% covering [illegible]% of the total amount of loan. The reason behind the unusually high proportion of interest free loans in Border area was that most of the Government loans were free of interest. That only [illegible]% of loans in Border area bear interest whereas as much as [illegible]% in Project area and [illegible]% in General area bear interest ranging were up to [illegible]%. It has been found that loans contracted from friends and relatives are free of interest, those from money lenders and other village Mahajans are usually of very high interests and so has already been mentioned in Project area and General area that constitute the major portion of the loans. It will be seen from table above that proportion of loan with interest between [illegible]—[illegible]% and [illegible]% as above [illegible] are respectively in Border area [illegible] and [illegible] and in Project area [illegible] and [illegible] and in General area [illegible] and [illegible].

5.5 The following table analyses the changes resulting in the acquisition and release of capital assets of the sample cultivator agricultural families as a result of the purchase and sale of the assets and liabilities during the period of a year:—

TABLE G-4

| | | |

Gross investment made by the families stands at Rs.[illegible], i.e., Rs.[illegible] per family in Border area, Rs.[illegible], i.e., Rs.[illegible] per family in Project area and Rs.[illegible], i.e., Rs.[illegible] per family in General area. It will be seen that in all the three areas the major portion of this investment is from opening of assets.

The investment consisting of borrowing and liquidation of assets amounts to Rs.[illegible], i.e., Rs.[illegible] per family in Border area, Rs.[illegible], i.e., Rs.[illegible] per family in Project area and Rs.[illegible], i.e., Rs.[illegible] per family in General area.

Thus in all the three disinvestment for outweighs investment with the result that a family in Border, Project and General area, on an average disinvests a sum of Rs.[illegible], Rs.[illegible] and Rs.[illegible] respectively. This net disinvestment arises largely, as is clear from table above, from the heavy rate of indebtedness among the families. Actually considering changes in assets alone there is a net increase of Rs.[illegible] per family in Border area, Rs.[illegible] in Project area and Rs.[illegible] in General area. But these increases are more than multiplied by average per family increase in indebtedness of Rs.[illegible], Rs.[illegible] and Rs.[illegible] respectively in the three areas.

[illegible] Investments in assets by various items are shown in the following table.

LP: Accom G-5 (1954) 136.5 A67 Ghani A67

511 It is seen that the per family average annual expenditure is Rs.[illegible] nP. in Border area, Rs.[illegible] nP. in Project area and Rs.[illegible] nP. in General area. The per family annual net income in the respective area betw Rs.[illegible] nP., Rs.[illegible] nP., and Rs.[illegible] nP. It follows that the budget of the average family is deficit in all the areas. This deficit is usually made up either by restricting the consumption expenditure during the lean months of the agricultural year or by taking loans.

512 The field work of the survey was started during the month of February, i.e., hardly after two months, of harvesting of winter paddy and during the harvesting period of cash crops like orange, betelnut, potatoes, etc. During this period people get money through the sale proceeds and naturally they were tempted to spend comparatively higher amount on food. In fact, it was made clear during investigation that as lean months are approaching when people did not have money to purchase food articles, they used to lead a very austere life. This period is particularly very hard for the Border people because unlike people of other two areas they do not have [illegible] paddy in store. As the above figures of annual expenditure of a family were calculated on the basis of information collected for one month preceding the date of investigation, in respect of food and non-food articles, and for one year in respect of miscellaneous items, there is every likelihood of the average per family expenditure on food and non-food articles being over-estimated.

513 As in the case of income, consumption of articles produced at home or at farm as well as those received out of the goods, services and gift and barter were valued in money terms on the basis of the local average retail prices in respect of the commodities concerned. Thus even firewood and other wild vegetables and fishes obtained by fishing were valued in terms of money. Of the total average expenditure on food, the food articles obtained in kind and consumed at home account for about 18 per cent in Border area, 13 per cent in Project area and 1[illegible] per cent in General area. Thus the share of food articles obtained in kind and consumed at home to the annual expenditure of a family is very low in Border area. This is natural because they depend almost exclusively on cash crop cultivation.

514 Out of the total expenditure, food accounts for about 68 per cent in Border area, 67 per cent in Project area and 58 per cent in General area. In all the above cases also lies the bulk of the expenditure on food, i.e., 86 per cent, 78 per cent and 81 per cent in the respective areas.

515 It is seen that expenditure on pulses, vegetables and milk are very low. In fact, only a few of the Tribal villagers take pulses, milk and vegetables. Rice and fish or meat are the only items of this dietary of most of the villagers.

516 Among non-food articles fuel and light accounted for 6 per cent in Border area, 7 per cent in Project area, and 3 per cent in General area. Beta are heavy chewers of betelnut and this accounted for 3 per cent of total annual expenditure in border area, 4 per cent in Project area and about 2 per cent in General area while tobacco and tea in normal accounted for about 2 per cent, 4 per cent and 4 per cent respectively of the total annual expenditure in the three areas. Expenditure on liquor

10.6. Of the total of [illegible] farms in Border area, [illegible] per cent were wholly owned, 17 per cent were wholly rented and the remaining 7 per cent were partly owned and partly rented. In Project area, proportions of wholly owned, wholly rented and partly owned and partly rented farms were found to be 79 per cent, 14 per cent and 06 per cent respectively while those in General area were respectively 86 per cent, 6 per cent and 10 per cent of the total number of farms. Of the total farm area, owned area accounted for in Border area 90 per cent, in Project area 96 per cent and in General area 91 per cent of the total farm area in the respective area. Of the total owned area, nearly 95 per cent in Border area, 98 per cent in Project area and 96 per cent in General area were operated by wholly owned farms and the rest by partly owned farms. Of the total rented area, in Border area, Project area and General area respectively 91 per cent, 60 per cent and 51 per cent are operated by wholly rented farms.

10.7. Out of 1000 families in Border area, 658 i.e. 65 per cent were indebted, average debt per family being Rs.[illegible] of, and [illegible] per indebted family being Rs. [illegible] of. In Project area out of [illegible] families 332 i.e. 33 per cent were indebted, average debt per family being Rs. [illegible] of and that per indebted family Rs. [illegible] of. In General area out of 186 families, 32 i.e. 17 per cent were indebted, average debt per family being Rs. [illegible] of, and that per indebted family being Rs. [illegible] of. Of the total indebted families, predominantly agricultural families constituted the highest proportion in all the three areas, being 78 per cent in Border area, 77 per cent in Project area and 80 per cent in General area accounting respectively for 67 per cent, 70 per cent and 60 per cent of the total amount of debt in the three areas. Majority of the loans were of small amount. Approach is in Border area 90 per cent of the loans are of size less than Rs. [illegible], average size of these loans being only Rs. [illegible] of. In Project area 71 per cent and in General area 73 per cent of the loans are of size less than Rs. [illegible], average size of these loans being respectively Rs. [illegible] and Rs. [illegible] only. Of the total number of loans 67 per cent in Border area, 61 per cent in Project area and 59 per cent in General area were of less than 3 years standing. Majority of the loans in Border and Project areas were found to be incurred for productive purposes. In General area 53 per cent of the loans were contracted for maintenance of the family.

Government and other professional and semi-professional money lenders emerged out to be the predominant sources of rural credit. In Border area home-Type Government accounted 62 per cent of the total number of loans accounting for 53 per cent of the total amount of loan, followed by those from money lenders which worked out to 48 per cent of the total number of loans accounting for 41 per cent of the total amount of loan. In Project area and General area respectively 67 per cent and 73 per cent of the total number of loans accounting for 58 per cent and 66 per cent of the total amount of loan in the respective area were contracted from private money lenders while Government loans constituted in Project area 48 per cent and in General area 37 per cent of the total number of loans accounting respectively for 42 per cent and 61 per cent of the total amount of loan in the respective area.

[illegible] Of the total number of farms [illegible] per cent in Border area, [illegible] per cent in Project area and [illegible] per cent in General area were free of income while rest of farmers for [illegible] per cent, [illegible] per cent and [illegible] per cent respectively of the farms in the farm area were found to be [illegible] per cent or more per annum which in case received upto [illegible] per cent.

[illegible] 10.3. Farm output of [illegible] per cent of the families in Border area, [illegible] per cent of families in Project area and [illegible] per cent of families in General area were less than Rs. [illegible] a year, while [illegible] per cent, [illegible] per cent and [illegible] per cent of the families in the respective area earned more than Rs. [illegible] a year from their farms. Of the total number of farms yielding less than or Rs. [illegible] a year in Border area [illegible] per cent of them are medium sized farms, and [illegible] per cent large sized farms, the corresponding proportions for Project area and General area being [illegible] per cent, [illegible] per cent, [illegible] per cent and [illegible] per cent.

[illegible] 10.3. In Border area the most important crops are oranges, banana, paddy, and [illegible] which respectively accounted for [illegible] per cent, [illegible] per cent, [illegible] per cent and [illegible] per cent of the total harvested area. In Project area paddy and oranges are the most important crop which accounted respectively for [illegible] per cent and [illegible] per cent of the total harvested area. The most important crops in the General area are paddy and potato which respectively accounted for [illegible] per cent and [illegible] per cent of the total harvested area.

On the basis of data collected for all the villages investigated average yield per acre worked out as paddy [illegible] maunds, potato [illegible] maunds, oranges [illegible] lacs ([illegible] numbers) and banana [illegible] lacs ([illegible] numbers). These yield exhibited wide variations among the three areas.

[illegible] 10.11. Proportions of families with annual gross income of less than Rs. [illegible], Rs. [illegible] to less than Rs. [illegible], and above Rs. [illegible] were respectively found to be [illegible] per cent, [illegible] per cent and [illegible] per cent in Border area, [illegible] per cent, [illegible] per cent and [illegible] per cent in Project area and [illegible] per cent, [illegible] per cent and [illegible] per cent in General area. Average annual gross income per family worked out to Rs. [illegible] in Border area, Rs. [illegible] in Project area and Rs. [illegible] in General area which for predominantly agricultural and semi-agricultural families respectively stood at Rs. [illegible] and Rs. [illegible] in Border area, Rs. [illegible] and [illegible] in Project area and Rs. [illegible] and [illegible] in General area. In all the three areas main contributors to family income were agriculture, service-professions/trade and trade respectively [illegible] per cent, [illegible] per cent and [illegible] per cent of the total average income in Border area, [illegible] per cent and [illegible] per cent in Project area and [illegible] per cent, [illegible] per cent and [illegible] per cent in General area.

The net annual income per family in different income groups varied between Rs. [illegible] to [illegible] in Border area, between Rs. [illegible] to Rs. [illegible] in Project area and between Rs. [illegible] to Rs. [illegible] in General area. The average net per family net annual income derived was Rs. [illegible] in Border area, Rs. [illegible] in Project area and Rs. [illegible] in General area and the ratio per capita of Rs. [illegible] in Border area, Rs. [illegible] in Project area and Rs. [illegible] in General area.

TABLE [illegible]

Distribution of loans to different economic groups

Loan groups	Rural Area				Urban Area				Combined Area			
	No. of loans	Amount (Rs. 000)		Total Rs. 000	No. of loans	Amount (Rs. 000)		Total Rs. 000	No. of loans	Amount (Rs. 000)		Total Rs. 000
		Cash	Kind			Cash	Kind			Cash	Kind

1:Garden E-4,5 (no date) 1997 AR? Khasi AR?

[illegible] prominent town on the boundary line, or by natural boundaries such as streams.

[illegible] 92] 64 In the *Wiar* country to the West of Cherra, notably the country between the heights of Laitkynsew and the plain, considerable portions of the hill-sides are the property of communities known as *ewings*. A *ewing* may be defined as a collection of families sprung from some common ancestress or ancestor. As an instance of these *ewings* I may describe the community known as the *lai ewing* which owns land in the neighbourhood of Laitkynsew, the area owned being known as the "*ri lai ewing*," or land of the three clans. These clans are descended from three sons, U Kynta, U Nalein, and U Tangwi, it being remarkable that in this case descent is traced originally from male ancestors and not from females. The three ancestors are said to have owned a large tract of land, and they had on their abode the village of Laitnawria close to Laitkynsew; but owing to an epidemic, or some such cause, they deserted the village of Laitnawria and went with their families to live in some of the surrounding *Wiar* villages, viz. in Tyrna, Nongkroh, Nongwar, Mawsh, and Mawlong. The descendants of the three sons above-mentioned possess a genealogical table, showing their descent from the original three founders of the *ewings*. They claim a large tract of country lying to the south and south-east of the Laitkynsew plateau, containing not only orange gardens, but also valuable lime quarries. There are other *ewing* communities also in the neighbourhood, e.g. the *kiawiew phew ewing*, or sixty *ewings*, who put forward claims to other tracts of land. The boundaries of the *ri lai ewing* are identifiable on the ground. [423] The business of the *ewing* community is managed by a doctor, an elder or other influential person being chosen as president.

923 [427] 692 In the country of the Lyngngam the crop belongs to the person who cultivates it, but the land belongs to the *kur* or family. The Lyngngam villages, like those in the Khasi Siemships, do not pay any rent to the Siem. If outsiders cultivate within the areas set apart for the different Lyngngam villages, all of them, including women, have to pay eight annas each to the people of the village in whose circle they cultivate. There is usually a mutual understanding between inhabitants of Lyngngam villages that certain tracts of land belong to the

[423] she does not have any daughter, the property will pass to the female descendants of sisters of Ka Long, as her other sisters Ka Laitum and Ka Laiban have left no daughters. It is therefore necessary to distinguish carefully between an elder and a younger sister, and also similarly between sisters of the mother. The protection of the women of the same house and extended family requires to be acted with care.

The youngest daughter and heiress is termed the Ka Khadduh. As Castle remarks the "Ka Khadduh is the custodian of the family property, not the full heir in the sense known to other systems of law, but a limited heir. She is responsible for the performance of religious ceremonies..... [424] she remains her mother, and if she be Ka Khadduh of the whole family, she puts the bones of all members in their final resting place under the stone (mawbah) of the clan. The expenses of this ceremony are considerable and for this reason she gets a larger share of property, or in some cases a piece of family property in addition and apart from her separate share. Members of the family who are unable to earn for themselves and have no children to earn for them have the right of being fed at the ing-Khadduh" (house of the heiress).

[425] The management of the property is however vested in the man of the family. The ancestral property of the family of myself U Subu Rai's mother was under the management of U Joi, in his mother's life-time; then, on the death U Joi, the next brother U Doi became manager. After U Doi, the management came to U Subu Rai. After him, the authority will pass to U Hojon, as U Sumbuni is dead and then to U Nodem. Any sons of Ka Pyn and other sisters will not get any precedence over U Nodem. As the senior U Kai of the Iaughlah Kur, U Subu Rai is also the manager of the common property of the Kur. [427] This land has been leased out to various persons and the total income is divided among the different houses of the Kur. [428] Whenever there is money to be distributed U Subu Rai calls together all the representatives of the Iaughlah houses and

exception. As I pointed out in the last chapter on the Garo, private ownership started with wet cultivation. In Kongkan, there are no common (village) or clan land: every piece of land is owned by some household—more precisely it is owned by the woman, the head of a household, and managed by her brother or maternal uncle. The majority of households in Kongkan possess land. Some of the richer households lend the land while some of the poorer households lease it. The rate for leases is Rs. 50/- per year for an area where one maund (Rs 80/-) of millet seeds can be sown. As there is no acreage system, the measurement is by quantity of seeds, and since shifting cultivation requires a change of field every year, the rent is fixed by the year. The parchal gardens, also privately owned, are never leased. When labour is required, the owner engages villagers, paying them Rs. 3/- per day.

In Sohkyndiah, there are some lands called "clan land." Throughout the history of the formation of Sohkyndiah village, as reconstructed from my data, can be traced some evidence of the evolution of land ownership. The first inhabitants of Sohkyndiah were said to be the people belonging to the Pratan clan (See Lists 8 and 9). It seems that when the Pratan came to this site, the land already belonged to the Dkhar clan of Rymmai village, five miles north of Sohkyndiah. The present distribution of land ownership confirms this story. The jhum field belonging to Sohkyndiah is divided into four sections according to the locality:

1. Lum Sohkyndiah	3. Sohliang
2. Mawkhalai	4. Lumpalong

One part of Lum Sohkyndiah belongs to the Pratan clan. The rest of Lum Sohkyndiah, Sohliang and Mawkhalai belong to the Dkhar clan of Rymmai village, the management of which is in the hands of Phrassing who came from Rymmai and married a woman of Sohkyndiah. Lumpalong is owned by Sor (Kynthah clan, 32 of List 6) privately. The Pratan and Dkhar lands are used by their descendants respectively. The people of other clans have to pay a rent of Rs. 60/- to use these clan lands. For the land which belongs to Sor, even the people of the same clan (Kynthah) have to pay rent since this land is privately owned. Thus the land of Sohkyndiah belongs partly to particular clans and partly to a private owner.

Gordon explains the existence of the clan land in the Khasi Hills as follows:

"The clan lands originally, when population was sparse, were owned by families, but as the members of the family increased and a clan was formed, the lands became the property of the clan instead of the family. Such clan lands are properly demarcated by stone boundary marks. The manager of the clan

workers and they were few in number." They were particularly employed for such work as the clearing of jungle for new jum gardens in summer.

In the orange season (December to February) the number of workers increased and they were paid more: Rs. 1.8 were paid for one load (one person carrying 60 pounds of oranges) from an orange garden to the railway station—about two miles. Usually a worker made three to five trips a day. Many workers from Jatinga used to come for this particular season.

Semi-permanent workers were engaged for wet-rice fields. They were usually Hindu cultivators since those Khasi and other tribes do not know the technique of wet cultivation; plains people like the Biharee immigrants were engaged. These workers were provided with servants' quarters where they lived with their wives and children. However, very few Jatinga households possessed rice fields.

The economic prosperity of Jatinga reached its climax during the period from 1939 to 1946. Since 1946, the orange production has been decreasing. In 1945, a serious disease attacked the orange gardens as well as the pan-leaf gardens. Besides, by depriving Jatinga, as it had Shella, of their most important markets, Dacca and Sylhet, the Partition of India and Pakistan in 1947 caused a serious economic depression in the whole region. On the other hand, because of the past prosperity, the population has rapidly increased during the last ten years. The serious economic condition of Jatinga is illustrated in the petition which was submitted by the Jatinga people when the Governor of Assam visited there some in January 1948. It runs thus:

"Since the last ten years or so, with the increase of population in the village and with the loss of fertility of the soil, the people were faced with economic depression. At present they are facing more shortage of land they have also no scope to adopt other forms of cultivation like jhooming and wet rice cultivation, etc. Moreover, there has been successive attack of Bright's disease which destroyed and wiped out all the orange and pan gardens. And as such, majority of the families have to depend for their livelihood on daily wages.

It is indeed a serious situation for them, because the Khasi do not produce staple foods, such as rice; their economy is completely dependent on the trade of their products by which they purchase their main provisions, clothes, etc. Other peoples round Jatinga, being jhum cultivators, can at least get rice and cotton; the minimum requirements, staple foods and clothing are available even in the worst conditions, so that they can at least maintain themselves though the standard of living is low. As I stated before, a few households in Jatinga possessed rice fields, but the majority had none. Recently they rented some plots of jhum field for rice cultivation from Zemi-Naga of neighbouring villages.[1] However, its yield was but a small percentage of their consumption. A few

1. If they had worked in the gardens of Jatinga, they might have got more profit than from their own jhum fields. For one day's labour, they got Rs. 6/-. For one month, they could earn Rs. 13 with which they could buy about 4.5 maunds of rice (one maunds paddy cost Rs. 3-4). For one year it became 50 maunds, which was impossible to produce in a jhum field by a single person's labour.

2. These rates, including the figures of note 1, apply to 1956.

3. Jatinga villagers told me that Zemi-Naga were kind enough to lent them their field for a negligible rent, though they had not enough for themselves. Zemi-Naga said that they owed much to Jatinga in the past, so that now they sympathised with the condition of Jatinga, and offered some parts of their jhum field.

TABLE C.9

Distribution of Predominantly Agricultural Families

Type	Quetta area			Pishin area			Chiltan area		
	No. of families			No. of families			No. of families		
	Highlands (Kalat District)	Lowlands (Kalat District)	Total	Highlands (Kalat District)	Lowlands (Kalat District)	Total	Highlands (Kalat District)	Lowlands (Kalat District)	Total
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1. Pastoralists [illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Owners cultivators [illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. Tenants [illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
4. Non owner [illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
5. Landless agricultural labourers	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

Apart from private lands [illegible] lands [illegible] to a family and land [illegible] through settlement by District Council have been considered as 'land owned' for the purpose of the survey. Income results take in view from landowners only those lands which are possessed by the [illegible] as private land or through estimates through District Council. A perusal of table C.1 given above will show that proportion of [illegible] are higher in Jowai subdivision which is due to the [illegible] in this subdivision of some big landholders who are known as [illegible]. Majority of the families shown against 'non-cultivating owner' are in fact agricultural labour families who also possess some land but due to some reason or other left it uncultivated. Among owner cultivators, tenants and permanent and permanent tenants are those who enjoy income is derived from agricultural labour. Combination of these two facts along with the number of landless agricultural families goes to show that the proportion of agricultural labourers in the district is rather high.

TABLE C10

Occupational distribution of families whose principal occupation is other than agriculture

Principal occupation	No. of families					
	Kadar area		Pnyut area		General area	
	Total	P.C. to total	Total	P.C. to total	Total	P.C. to total
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Non-agricultural labour.	[illegible]	[illegible]	[illegible]	[illegible]	0	[illegible]
2. Service, professions, etc.	[illegible]	[illegible]	[illegible]	[illegible]	0	[illegible]
3. Trades -- -- --	[illegible]	[illegible]	[illegible]	[illegible]	4	[illegible]
4. Small scale manufacture & handicraft.	[illegible]	[illegible]	[illegible]	[illegible]	1	[illegible]
5. Poultry & dairy farming.	7	[illegible]	--	--	3	[illegible]
6. Others -- -- -- --	[illegible]	[illegible]	[illegible]	[illegible]	--	--
Total --	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

TABLE [illegible]

Village group	No. of families holding land	Total area of holdings (acres)	No. of the villages with land	Area based on [illegible]	No. of the villages with remaining cultivable land	Area cultivable land (acres)	Area left fallow	Percentage area to col. 8
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
1. Border area	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
2. Project area	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
3. General area	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

Thus it is seen that of the owned land, at least [illegible] per cent in Border area, [illegible] per cent in Project area and [illegible] per cent in General area were left fallow.

Considering the number of families, it was found that in Border area villages as many as [illegible] families had either totally leased out or left fallow their owned land, the corresponding number for Project area and General area being only [illegible] and [illegible] respectively.

TABLE [illegible]

Distribution of farmers according to size and ownership

	[illegible]	[illegible]	[illegible]	[illegible]

TABLE D-7

Distribution of farms, farm by size and type of ownership

Area in acres

Size of farms			Wholly owned	Wholly rented	Partly Owned and partly rented: Owned area	Partly Owned and partly rented: Rented area	Partly Owned and partly rented: Total	Total owned area (3+5)	Total rented area (4+6)	Total (7+8)
(1)			(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
a. Specified sample—										
Small farms (Less than 5 acres)	—	—	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Medium farms (5 to less than 10 acres)	—	—	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Large farms (10 acres and above)	—	—	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Total	—	—	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
			[illegible]	[illegible]	[illegible]	[illegible]		[illegible]	[illegible]	[illegible]

From the above table it is evident that in all the areas in each area group south, northern and high, a high proportion of the farms (i.e., in Land [illegible] per cent in Border area, [illegible] per cent in Project area and [illegible] per cent in General area) is wholly owned and the area owned by these wholly owned farms also constitute almost similar high proportions (i.e., [illegible] per cent in Border area, [illegible] per cent in Project area and [illegible] per cent in General area) of the farm area available in the respective village group. Owned area under all farms amounts to [illegible] acres ([illegible] per cent of the total farm area) in Border area, [illegible] acres, [illegible] per cent in Project area and [illegible] acres [illegible] per cent in General area. Of the total owned area, in Border area nearly [illegible] per cent is accounted by wholly owned farms and the rest by the partly owned farms. In Project area and General area respectively [illegible] per cent and [illegible] per cent of the total owned area are owned by wholly owned farms. Thus the area available for owning in Border area constitutes [illegible] per cent of the total farm land amounting to [illegible] acres of which [illegible] per cent is under wholly owned farms and [illegible] per cent under partly owned farms. In Project area total area available for owning constitutes [illegible] per cent (i.e., [illegible] acres) of the total farm area of which [illegible] per cent and [illegible] per cent respectively are under wholly owned and partly owned farms while in General area [illegible] per cent ([illegible] acres) of the total farm area are available for owning of which respectively [illegible] per cent and [illegible] per cent are owned by wholly owned and partly owned farms.

It is seen from Table [illegible], that total tented area in Border area, Project area and General area are respectively [illegible] acres, [illegible] acres and [illegible] acres. A comparison of these figures with the figures of land leased out as in Table [illegible] which are respectively [illegible] acres, [illegible] acres and [illegible] acres in the three areas, goes to show that some of the village lands taken on rent by the villagers belong to near neighbouring villages who live outside the village.

29: Assam G-5 (1958) 1963 AR7 Khasi AR7

10.6. Of the total of 799 farms in Border area, 70 per cent were wholly owned, 17 per cent were wholly rented and the remaining 7 per cent were partly owned and partly rented. In Project area, proportions of wholly owned, wholly rented and partly owned and partly rented farms were found to be 73 per cent, 11 per cent and 16 per cent respectively while those in General area were respectively 86 per cent, 4 per cent and 10 per cent of the total number of farms. Of the total farm area, owned area accounted for in Border area 83 per cent, in Project area, 85 per cent and in General area 91 per cent of the total farm area in the respective area. Of the total owned area, nearly 95 per cent in Border area, 92 per cent in Project area and 90 per cent in General area were covered by wholly owned farms and the rests by partly owned farms. Of the total rented area, in Border area, Project area and General area respectively 91 per cent, 49 per cent and 51 per cent are covered by wholly rented farms. 423 427

10.7. Out of 1046 families in Border area, 650, i.e. 62 per cent were indebted, average debt per family being Rs.157·94 nP. and that per indebted family being Rs.251·25 nP. In Project area out of 441 families 332, i.e., 30 per cent were indebted, average debt per family being Rs. 120·35 nP. and that per indebted family Rs.272·60 nP. In General area out of 104 families, 32, i.e. 29 per cent were indebted, average debt per family being Rs. 54·99 nP. and that per indebted family being Rs. 189·08 nP. of the total indebted families. Predominantly agricultural families constituted the highest proportion in all the three areas, being 98 per cent in Border area, 77 per cent in Project area and 90 per cent in General area accounting respectively for 97 per cent, 78 per cent and 99 per cent of the total amount of debt in the three areas. Majority of the loans were of small amount inasmuch as in Border area 98 per cent of the loans are of size less than Rs.500·00, average size of these loans being only Rs. 69·25 nP. In Project area 71 per cent and in General area 73 per cent of the loans are of size less than Rs. 200·00, average size of these loans being respectively Rs. 66·60 and Rs. 99·20 only. Of the total number of loans 67 per cent in Border area, 61 per cent in Project area and 90 per cent in General area were of less than 3 years standing. Majority of the loans in Border and Project areas were found to be incurred for productive purposes. In General area 53 per cent of the loans were contracted for maintenance of the family. 162 426

Government and other professional and semi-professional money lenders emerged out to be the predominant sources of rural credit. In Border area loans from Government constituted 82 per cent of the total number of loans accounting for 53 per cent of the total amount of loans followed by those from money lenders which worked out at 65 per cent of the total number of loans accounting for 41 per cent of the total amount of loan. In Project area and General area respectively 60 per cent and 78 per cent of the total number of loans accounting for 30 per cent and 34 per cent of the total amount of loan in the respective area were contracted from private money lenders while Government loans constituted in Project area 40 per cent and in General area 17 per cent of the total number of loans accounting respectively for 70 per cent and 61 per cent of the total amount of loan in the respective area. 426

435 439 at the rate of two or three ears for a farthing; and sugar-cane, the [243] cultivation of which is also very limited, at from a little over a farthing 273 to three-farthings per cane. A fermented liquor called *kadam*, made 435 from rice, is sold at from three-farthings to threepence a quart, according to strength; and a distilled spirit called *phatika*, or *kakiad-khrak*, at from threepence to fourpence-halfpenny a quart. This latter description of liquor is sometimes made very strong. No records exist by which the present prices of the above articles can [731] be compared with the rates ruling ten years ago. The maximum price of rice during the famine of 1866-67 was 5 *sers* 6 *chhatáks* for the rupee, or about £1 a hundredweight.

804 Measures, Weights, etc.—The Hill people have no proper 805 measurement of time or distance. If there be any standard for measuring distance, it is by the number of *páns* a man chews in the course of a journey, generally about one every half hour. In some parts of the District, land is measured by a stick called *ka dieng-nong*, varying in length from six to seven cubits. Liquids are measured in gourds of different measures, varying from half a *chhaták* to a *ser*, and also in bamboo tubes. Rice, potatoes, beans, etc. are measured in baskets, varying in size in different markets from two to eighty pounds.

805 In the Khásí Hills the inhabitants reckon eight days in the week, named as follows:—(1) Lyn-kah; (2) Nong-krem; (3) Um-long; (4) Rang-hep; (5) Shillong; (6) Pom-tih; (7) Um-nih; (8) Yeo-duh. In the Jáintiá Hills the eight days are named thus:—(1) Kyllao; (2) Pyn-sing; (3) Máo-long; (4) Máo-siang; (5) Máo-shai; (6) Pyn-kat; (7) Thym-blein; (8) Ka-hat. The Khásí months of the year, calculated by moons, are as follow:—(1) U Kylla lynkot; (2) U Rym-pang; (3) U Lyber; (4) U Laiong; (5) U Jimmang; (6) U Jilliw; (7) U Nai-túng; (8) U Nai-lar; (9) U Nai-lúr; (10) U Rysow; (11) U Nai-wing; (12) U Noh-prah.

464 Landless Labouring Classes.—There is, and always has been, 423 a large class of labourers in the District who neither rent nor possess any land. Women and children are employed in manual out-door labour of all kinds.

Varieties of Land Tenure can hardly be said to exist. There 423 is nothing whatever resembling the relations between landlord and [427] tenant throughout the Khásí Hills. The lands as a rule are either ancestral property or belong to village communities, and are cultivated under unwritten but well-understood agreements. Of the wide

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

extent of waste land, some is cultivated in a manner resembling the *jhum* system,—successive crops are grown on a patch of land till the soil is exhausted, and then another spot is selected, where the same process is repeated afresh, but without anything that can be called a *jhumid* tenure. Any renting of land is exceptional, and there are no recognised rates of rent. The Deputy-Commissioner, however, states that an ordinary rate for rented land would be from two to three shillings a year for as much land as an individual can cultivate with his own hands. 423 [427]

MANURE is generally used in raising rice and potatoes. It is seldom purchased, the dung and litter of the cattle and other animals about the house being generally utilised for the purpose. For rice fields a little less than half a ton of manure, but for potatoes upwards of two tons, is required per acre. Manure, if purchased, would cost from 2s. 7½d. to 3s. 9d. per acre for rice land, and for potato fields from 12s. to 18s. per acre. 243 244 [435]

IRRIGATION for agricultural purposes is regularly practised. Water is brought to the land by means of channels cut from the numerous hill streams in the neighbourhood of the fields. Wells and tanks are unknown. The work of irrigation by means of these channels is very easily carried on, and at a very trifling outlay. Rotation of crops is not practised in the Hills. 312

MODEL FARM.—The Shillong Model Farm, established in 1873, has not proved a success. Experiments tried with wheat give some hope that cold-weather crops may profitably be introduced into the Hills. Two new varieties of potato—'red roughs' and 'pheasant's eye'—were successfully introduced in 1873-74; but these are not looked upon favourably by the Khásiás, as they only give one crop in the year, whereas the ordinary variety yields two crops. Several fruit-trees have been planted out, including apple, pear, cherry, nectarine, and plum; and the tables of the European residents are supplied with vegetables from the garden attached to the farm. A *Manual of Potato Cultivation* compiled by the superintendent has been translated into Assamese, and copies have been distributed among the adjoining Hill tribes. The general failure in all the agricultural experiments is attributed partly to the unfitness of the soil, and still more to the ravages of white ants and other insects peculiar to the Hills. The attempts to improve the indigenous breeds of live stock have been equally unfortunate. During the two years 1874-76 the sum of Rs. 1744 177 244 648 654 177 245 648 654 [134] [136] 231 648 654

E. Gordon E-4, 5 (no date) 1991 XR7 Khasi XR7

or Mynnār, spoken in the extreme north, and there may be others. A great desideratum for linguistic purposes is a more adequate method of recording sounds, and especially differences of tone, than that adopted for the standard speech, which though sufficient for practical purposes, does not accurately represent either the quantity or the quality of the vowels, and leaves something to be desired as regards the consonants (especially those only faintly sounded or suppressed). These things, no doubt, will come in time. The immense advance which has been made in education by the Khasis during the last half-century has enabled some among them to appreciate the interesting field for exploration and study which their own country and people afford; and there is reason to hope that with European guidance the work of record will progress by the agency of indigenous students.

It remains to summarize briefly the principal distinctive features of this vigorous and sturdy race, who have preserved their independence and their ancestral institutions through many centuries in the face of the attractions offered by the alien forms of culture around them.

In the first place, their social organization presents one of the most perfect examples still surviving of matriarchal institutions, carried out with a logic and thoroughness which, to those accustomed to regard the status and authority of the father as the foundation of society, are exceedingly remarkable. Not only is the mother the head and source, and only bond of union of the family: in the most primitive part of the hills, the Synteng country, she is the only owner of real property, and through her alone is inheritance transmitted. The father has no kinship with his children, who belong to their mother's clan; what he earns goes

InGordon E-4,5 (no date) 1907 ART Khasi ART

643 liquor being subject to no fiscal restrictions whatsoever. In a
651 few States the Siems are commencing to levy registration fees,
443 but the amounts are insignificant. Judicial fines are divided between the chief and the members of the durbar. In some States the Siems' incomes amount to a few hundreds a year only. Generally speaking, the Khasi chiefs are necessarily a very impecunious set of persons, and many of them are in-
643 debted to, comparatively speaking, large amounts. The Siem
631 is appointed from the Siem family, there being such a family in each of the fifteen Khasi States. The most important States are Khyrim, Mylliem, Cherra, Nongstoin, and Nongkhlaw. There are a few other petty States presided over by Lyngdohs, Sirdars, or Wahadadars. A fact which is of universal application is, that heirship to the Siemship lies through the female side. The customary line of succession is uniform in all cases, except in Khyrim, save that in some instances cousins rank with brothers, or are preferred to
643 grand-nephews, instead of being postponed to them. The
428 difference between the rule of succession and the rule of inheritance to real property should be noted. In the former case the sons of the eldest uterine sister inherit in order of priority of birth, although it is true that this rule has sometimes been disregarded. In cases of succession to realty, however, the inheritance goes to the youngest daughter of the deceased's mother, and after her to her youngest daughter. In successions to the Siemships, in the absence of male heirs from the eldest sister the succession passes, by what has been aptly described as the "knight's move," to the male children of the next eldest sister. In Khyrim the custom of succession is peculiar, there being a High Priestess, and heirship being
643 limited to her male relatives. Generally speaking, it would
64 appear that succession was originally controlled by a small
773 electoral body constituted of the heads (*lyngdohs*) of certain priestly clans, who, it is presumed, exercised their authority to reject candidates, when necessary, mainly on religious grounds. There has, however, been a distinct tendency towards the broadening of the elective basis. In the large State of Khyrim the number of the electoral body has been greatly increased by the inclusion of the representative headmen of certain clans but not priestly clans (*mantris*).

1:Gurdon E-4.5 (no date) 1907 AR7 Khasi AR7

586 Khasi religion. If the marriage has been celebrated according to the *pynkier synjat* rite, a *kniang* (go-between) is necessary on each side, also the *kni*, or maternal uncles of the parties, to witness the divorce. In other cases the presence of the *kniang* is unnecessary, but some acquaintances and friends as well as the relatives on both sides should witness the ceremony. The husband and the wife each bring five cowries (*shài*), or, more commonly nowadays, five pice. The wife gives her five cowries or pice to her husband, who places them with his, and then returns the five cowries or coins to his wife, together with his own five. The wife then returns the ten shells or coins to the husband who throws them on the ground. A crier (*u nong*
[203] *pyrta shnong*) then goes round the village to proclaim the divorce, using the following words:—

"Kaw—hear, oh villagers, that U—— and K—— have become separated in the presence of the elders. Hei! thou, oh, young man, canst go and make love to Ka—— for she is now unmarried (*khynraw*), and thou, oh, spinster, canst make love to U——. Hei! there is no let or hindrance from henceforth." Among the Khasis divorce must be by mutual consent,
[587] and the ceremony must take place in the open air. Until the divorce ceremony has been performed as above described, neither husband nor wife can marry again, but after it has taken place, either can remarry, but not within the family of the divorced husband or wife. In the event of a husband or wife being absent for a long period, say ten years, without any communication having been received from either of them, a divorce ceremony is performed by the relatives on his or her behalf. It is stated by U Jeebon Roy * that the rule of
575 monogamy is not so strict for the husband as it is for the wife,
428 he can contract an informal alliance with another woman, the only prohibition being that she must not belong to the original wife's village. Such a wife is called *ka tynga tuh*, literally, stolen wife, in contradistinction to the legally married wife (*ka tynga tuei*). The children by the unmarried wife are called *ki khun khiar* (children from the top). By children from the top, is understood to mean children from the branches not from the root (*trai*) of the tree. Such children cannot claim ancestral property except in the war country.

113

* See page 18, "Ka Xiam Khasi." (U Jeebon Roy.)

INHERITANCE.

428 The Khasi and Synteng laws of inheritance are practically the same, although in some of the doloiships in the Jaintia Hills there are some slight differences. The Wár law of inheritance differs greatly from that of the Khasis, and the customs of the Bhois or Mikirs, who inhabit the Bhoi doloiship of the Jaintia Hills, are totally different from those of the Khasis, thereby supplying another link in the chain of evidence in support of the conclusion that the Bhois, or, more correctly speaking, the Mikirs, are of Bodo origin, and not Khasi or Mon-Anam. The Lynngams follow the Khasi law of inheritance. It will be convenient to describe the Khasi law first, and then to pass on to the special customs in vogue in the different doloiships in the Jaintia Hills, and, finally, to describe the Wár, Bhoi and Lynngam customs.

611 The Khasi saying is, "*long jaid na ka kynthei*" (from the
562 woman sprang the clan). The Khasis, when reckoning descent count from the mother only; they speak of a family of brothers and sisters, who are the great grandchildren of one great grandmother, as *shi kpoh*, which, being literally translated, is one womb, i.e. the issue of one womb. The man is nobody. If he is a brother, *u kur*, a brother being taken to mean an uterine brother, or a cousin-german, he will be lost to the family or clan directly he marries. If he be a husband, he is looked upon merely as *u shong kha*, a begetter. In some of the Wár villages a newly married man is spoken of by the bride's family as, "*u khun ki briew*," some one else's son. It is,
593 perhaps, somewhat of a paradox under the circumstances that
764 wives should address their husbands as "*kynrad*," or lord.
611 There is, however, no gainsaying the fact that the husband, at least in theory, is a stranger in his wife's home, and it is certain that he can take no part in the rites and ceremonies of his wife's family, and that his ashes after death can find no place within the wife's family tomb, except, in certain cases, amongst
794 the Syntengs. Further, the ceremonial religion amongst Khasis,
562 especially that of the home, is in the hands of the women. It is, therefore, perhaps not to be wondered at, considering the
428 important status assigned to women by the Khasis, that women

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

should inherit the property and not men. The rule amongst the Khasis is that the youngest daughter "holds" the religion, "*ka bat ka niam.*" Her house is called, "*ka iing seng,*" and it is here that the members of the family assemble to witness her performance of the family ceremonies. Hers is, therefore, the largest share of the family property, because it is she whose duty it is to perform the family ceremonies, and propitiate the family ancestors. The other daughters, however, on their mother's death are entitled, each of them, to a share of their mother's property, although the youngest daughter gets the lion's share, e.g. the family jewellery, and the family house, and the greater part of what it contains. The youngest daughter cannot dispose of the house without the unanimous consent of her sisters. If the youngest daughter dies, she is succeeded by the next youngest daughter, and so on. All the daughters are bound to repair the house of the youngest daughter free of cost. In the event of the youngest daughter changing her religion, or committing an act of *sang*, or taboo, she loses her position in the family, and is succeeded by her next youngest sister, as in the case of a death. Failing daughters, inheritance would pass by the "knight's move" to the sister's youngest daughter, who would be succeeded by her youngest daughter, and so on. Failing sister's daughters succession would revert to the mother's sisters and their female descendants. In the Jaintia Hills the inheritance of all real property passes from mother to youngest daughter. No man in the uplands of the Jaintia Hills can possess landed property, unless it is self-acquired property. In the Jaintia Hills, if a man dies and leaves acquired property, his heir will be his mother, if alive, excluding wife, sons, and daughters. If the wife, however, undertakes not to re-marry, she will inherit half of her husband's property, which at her death will descend to her youngest daughter by him.

Amongst Khasis all property which has been acquired by a man before marriage is considered to belong to his mother; indeed it may be said to belong to the man's *kur*, or clan, such property being called by Khasis, "*ka mai iing kur*" (the earnings of the house of the clan). After marriage, if there are children, the case is different, provided that the property

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

421 has been acquired by the man after marriage. Here the wife
428 and children would inherit the acquired property, the youngest daughter obtaining the largest share of such property on the death of the wife. If there were no daughter, the acquired property would be equally divided amongst the sons.

[127] The following examples of the Synteng law of inheritance
428 are taken from the exhaustive diaries recorded by the late Mr. Heath, who was for some years Sub-Divisional Officer of Jowai. In the Nongkli doloiship ancestral land passes from mother to her youngest daughter; again, if a youngest daughter who has so acquired dies, the next youngest in point of age succeeds. Should such direct female succession fail, the family tree has to be looked up for the nearest branch, in which the youngest female, or her youngest female descendant, succeeds. Thus, respecting ancestral land, the youngest daughter, or youngest female descendant of youngest female heir, is virtually heir to entailed property. If a woman dies leaving acquired property, her youngest daughter or youngest granddaughter of that youngest daughter succeeds to all. In default, next youngest daughter, and so on. In default of daughters, the youngest son inherits. A man can hardly, in any circumstances, possess ancestral land; his property must almost necessarily be self-acquired. If a man dies leaving acquired property, his heir will be his mother, if alive, excluding wife, sons, and daughters. If the wife undertakes, however, not to marry again, she will get half, which will descend to her youngest daughter by her deceased husband. The mother, who thus gets the whole or half of her son's property, leaves it to her youngest daughter, or youngest daughter of that daughter, and so on, as described above in the case of a woman leaving ancestral or acquired property. If there is no mother, the man's youngest sister stands next heir with the same right as her mother. If there is no mother or sister, then the sister's female descendants stand in the man's mother's place. If there are none of these, then the man's youngest daughter succeeds to all. Ancestral property
[425] cannot be alienated without the consent of all the heirs in the entail. A gift of self-acquired property to any amount can be made by a donor during his lifetime. Acquired property cannot, however, be left by will out of the course sanctioned by

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

custom. In the Amwi doloiship a widow who consents to pay the costs of her husband's funeral, provided she agrees not to re-marry, inherits half of her husband's acquired property. 428 [589]

In the War country the children inherit both ancestral and acquired property in equal shares, both males and females, with the exception that the youngest daughter is given something in addition to her share, although not such a large share of the property as amongst the Khasis. Amongst the Mikir-Bhois, i.e. the Mikirs who inhabit the Bhoi doloiship of the Jaintia Hills, the law of inheritance is totally different from that of the Khasis, for males succeed to all property, whether ancestral or acquired. Thus, if a man dies, leaving son, mother, wife, and daughters, the son takes all. If there are several sons, they divide. If there are no sons, the property goes to the nearest male heir. If a woman dies, leaving husband and children, the husband takes all. If the husband is dead, and there are sons and daughters, the former inherit. The great difference in the custom of inheritance between Khasis and Bhois is, as I have already pointed out, part of the evidence that these people are of different origin.

The Lynngam law of inheritance is the same as that of the Khasis. The youngest daughter obtains the largest share of the ancestral property, the remainder being divided between the remaining daughters. The sons do not get any share. The rule is also said to apply with regard to acquired property.

ADOPTION.

Both Khasis and Syntengs observe a custom known as *'rap iing* (an abbreviation for *ia rap iing*, literally, to help the house). This is practically adoption. If in a family the female members have died out, the male members of the family are allowed by custom to call (*khot*) a girl from some other family, to act as *ka'rap iing*, and to perform the family religious ceremonies, and therefore to inherit the family ancestral property. The female so introduced into the family then takes her place as *ka khun khadduh*, or youngest daughter, and becomes the head of the house (*ka trai iing*). The 597 428

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

The
597 adoption of a female obviates the family dying out (*iap duh*),
428 which to the Khasi is a very serious matter, inasmuch as there
764 will then be no one qualified to place the bones of its members within the family tomb (*ka ba thep shieng mawbah*), and to
597 perform the requisite funeral ceremonies. Amongst the Khasis no particular ceremonies are performed at the time of
262 adoption; but some of the Syntengs observe a religious cere-
782 mony which consists largely of a feast to the clans-folk, at which liquor, rice, dried fish, and ginger are partaken of. Before the feast commences, each clansman is provided with a small gourd (*u klong*) filled with liquor, a little of the latter is then thrown on the ground from the gourd, and the following words are uttered:—

"Oh, God! oh, Lord! oh, ruling king Biskurom, now the *pynrap iing* ceremony is about to be performed, let the ceremony be propitious, and let males and females (of the clan) increase in numbers, so that the clan may become great, and respected, and that intelligent male members may spring up." No such ceremony is, however, observed, it is understood, in the Nartiang and Raliang doloiships.

597 In the case of a family being *iap duh* (extinct), the family
428 property, according to Khasi custom, passes to the Siem. Therefore it is to the interest of the members of families to
421 adopt a female, when such necessity arises. As there is no religious ceremony which is compulsory to the Khasis on the occasion of an adoption, perhaps we are almost justified in concluding that in former times the adoption custom did not exist, more especially as the Khasis possess a special word, *iap duh*, for describing a family the females of which have all died out; and it is admittedly the custom for the Siem to succeed to the
177 property of such a family. The Synteng custom of *'rap iing*
797 may have been borrowed from the Hindus, when the Rajas of Jaintia became converts to that religion.

TENURE OF LAND AND LAWS REGARDING LAND.

423 Land in the Khasi Hills proper, i.e. land in the high plateau, is held somewhat differently from land in the Jaintia Hills and

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

423 Thang khiew clan, and many others. It has been explained,
614 in a previous paragraph, how the clan grew out of the family. The clan lands originally, when population was sparse, were owned by families, but as the members of the family increased and a clan was formed, the lands became the property of the clan instead of the family. Such clan lands are properly demarcated by stone boundary marks. The manager of the clan lands is the *kni* (maternal uncle of the youngest daughter of the main family, or branch of the clan), whose house "*ka iing khadduh*," or last house, is the place for performing all the religious ceremonies of the clan, and is also called *ka iing seng*. All the members of the clan are, however, entitled
[425] to share in the produce of any of the clan lands they may cultivate. No clan lands can be alienated without the consent of a durbar of the whole clan.

423 *Iki kynti* are private lands which have been either acquired
428 by a man or woman individually, or, in the case of a woman, inherited from her mother; such lands must be entirely distinguished from the lands of the clan. In portions of the Jaintia Hills, if a man purchases a piece of land, at his death it passes to his mother, to the exclusion of his children; but in the Khasi Hills nowadays a man may leave such lands, provided they were acquired after marriage, either formally by will, or informally, to his children for their support. In land customs as well as other customs the Syntengs seem to preserve more closely than the Khasis what are probably the ancient usages of the race. It must be clearly understood, however, that all land acquired by inheritance must follow the Khasi law of entail, by which property descends from the mother to the youngest daughter, and again from the latter to her youngest daughter. Ancestral landed property must therefore be always owned by women. The male members of the family may cultivate such lands, but they must carry all the produce to the house of their mother, who will divide it amongst the members of the family. Daughters, other than youngest daughters, are entitled to maintenance from the produce of such family lands.

423 In the Jaintia Hills lands are classified as follows:—

I: Gurdon E-4, 5 (no date) 1907 ART Khasi ART

The above and other similar sacrifices to the gods of the State or divisions of the State may be said to be the communal religious duties of the *lyngdohs*. The duties of *lyngdohs* with reference to private persons may now be mentioned. When it is found that any two people have made an incestuous marriage, that is to say a marriage within the exogamous group of the *kur*, or clan, the parties at fault are taken before the *lyngdoh* by their clansmen, who request him to sacrifice in order to ward off the injurious effects of the *sang*, or taboo, of such a connection from the kinsfolk. On this occasion a pig is sacrificed to *u'lei lyngdoh* and a goat to *ka lei long raj*. The parties at fault are then outcasted. As mentioned in another place, the sin of incest admits of no expiation for the offenders themselves. In the Khyrim State, it is said by the *lyngdohs* themselves, although not by the Siem or the myntries, that they are the reversionary legatees of all the persons who die without leaving female heirs (*iap duh*). In other Siemships such property passes to the Siem. The *lyngdoh* of Nongkrem can also take possession of the property of persons who have been found to harbour an evil spirit (*jingbih*) in their houses. It appears that in such cases the house and furniture are burnt, as in the case of the *Taroh* superstition in the Jaintia Hills, the *lyngdoh*, however, taking possession of jewellery or anything else of value. The only practical service the *lyngdoh* renders in return is to build the afflicted person a new house; unless, indeed, we take into account the casting forth of the devil by the *lyngdoh*. Mr. Jenkins, of Shangpung, in the Jaintia Hills, writes: "Such is the belief of the people in the evil spirits, that they are completely under the influence of the priests and spend large sums of money in order to secure their favour. They live in constant dread lest by the least transgression or omission they should offend these avaricious men and so bring upon themselves the wrath of the demons." The influence of the *lyngdohs* over the people in the Jaintia Hills seems to be stronger than in the Khasi Hills. For instance, it came to my notice in Raliang that crops cannot be cut until the *lyngdoh* has seen them, in other words, until the *lyngdoh* has claimed and obtained his share of the produce. In many places, however, in the Khasi Hills the *lyngdoh* is much discredited, owing, no doubt, to the advance of Christianity & education.

1: Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

765 If any stream has to be crossed, a rough bridge is made of
764 branches and grass. This trail of leaves and the bridges are intended to guide the spirit of the deceased to the cairn. The person who carries the bones is not allowed to turn round, or to the right, or to the left, but must proceed straight to the cairn. On reaching it, a *nongknia*, or sacrificer, washes the bones three times and then places them in an earthen pot, tying up the mouth with a white cloth. Then, having taken three pieces of the hard yolk of an egg, three loaves of bread, the leg of the fowl, "*u'iar krad lynti*," and the lower jaw-bones of the animals which have been sacrificed, he places them inside the cairn and shuts the door. Eatables and
765 betel-nut are then placed on the top of the cairn. Early next
787 morning the relatives and friends go to the cairn with fresh food and water, and look about for new foot-prints, the idea being
[775] that from these foot-prints they can foretell future events. This they do until the third night after the cremation. During these three nights the front door of the house formerly occupied by the deceased is never closed, it being thought that the spirit may wish to return and visit its earthly abode. The whole family is moreover *sang*, or taboo, during this period, and no manner of work can be done. When the three nights are over, it is called the *lait ia*, i.e. the days (of mourning) are passed, and three eggs are broken to ascertain what was the cause of the death. After this the family goes to bathe, and
[783] the clothes and mats in the house are washed. When this has been done, the taboo is removed and the family can go to work. After a month a pig or a fowl is sacrificed, the ceremony
782 being called "*ai bam lait bnai*." It will be observed that *three*
765 seems to be the lucky number throughout these funeral
801 ceremonies. The number seems to bear a similar significance in other matters of Khasi ritual, e.g. the pouring out of libations, which is always done three times.

587 It is *sang* or taboo for a Khasi widow to re-marry within one
428 year from the death of her husband, there is a similar prohibition for a husband re-marrying; but such *sang* can be got over by the payment of a fine to the clan of the deceased. After the expiration of one year the fine is reduced in amount. Khasi widows do not as a rule re-marry, according to U Jeebon Roy,

1:Gurdon E-4, 5 (no date) 1907 AR7 Khasi AR7

587 unless they have no female children, in which case the clan
428 urges them to re-marry, so that the chain of inheritance may not be broken, inheritance amongst the Khasis always passing in the female line.

CUSTOMS IN CONNECTION WITH DEATHS BY VIOLENCE OR ACCIDENT.

766 These customs are interesting enough to deserve a separate
782 description; they are as follows:—

If a man dies by the sword, before his body can be burnt,
776 a sacrifice of a black hen must be offered to *Ka Tyrut*, the goddess of death. The bones are then placed in a stone cairn. Again they are removed, and, after eggs have been broken, are taken to a river bank and there washed. If there is no river at hand, a tank is dug for the purpose, which is called *umkoi*. There are various such *umkois* in different parts of the district, e.g. near Raliang and Nartiang. A sacrifice of a goat is offered to the god *U Syngkai Bamon*, and a sow to *Ka Ramshandi*, both of whom are evil deities. Another sow is sacrificed to *Ka Tyrut*. After this the bones are placed in another newly-built cairn. The ceremony of placing the bones in one and
[787] then removing them to another cairn is usually performed three times; but unless the auspices, as deduced from the eggs, are favourable, the relatives must go on sacrificing and removing the bones until they are so. These ceremonies having been completed, they erect a flat table-stone, or *mawkynthei*, for the ghost of the departed to sit upon, and return home, where they propitiate their ancestors with offerings of food. In the case of the murdered victims of the *thlen* superstition the same ceremonies are observed. For people who have died by drowning, or been killed by wild animals, and for women who have died in child-birth, similar pujas are
766 offered, except that a sacrifice to *U Syngkai Bamon* does not take place. In the case of one who has died at a distance from
782 his home, e.g. in a foreign country, whose body has not been burnt in accordance with custom, and whose bones have not been collected, the members of his clan, or his children, take three or five seeds or cowries (*sbai*) to a place where three roads meet. Here they summon the spirit of the departed in a loud voice,

782 The Khasi also erect little platforms with little houses from long bamboo sticks in which food is served to the spirits of the woods and fields (to serve [siang-] actually means spread out, as one spreads out a carpet or as one spreads out leaves for serving rice on).

[789] But not only through making sacrifices do the Khasi try to propitiate the devils and thereby make them harmless. They even try it with violence. Thus, as mentioned above, they drive the cholera demoness out of the house with sticks. Also during a cremation they shoot three arrows to ward off evil spirits.

There are many ways of warding off evil spirits; or, for acquiring their help words, wishes, or curses are used, as, for example, during a match of arrow shooting, the watchers who stand by the target try to keep the arrows of the opponents from hitting the target by calling on some god (ksuid) and the more they shriek, the sooner they believe they will attain their purpose. They wish to influence the arrows of the opponents.

3. Taboos (sang)

784 The sang or taboos of the Khasi also belong
782 to superstition. Sang means the same as "sacrilegiously or most strictly forbidden." This sang can be traced back to totemistic views. Sang can be something for a single person, for a house (iing) or a family, for a sib and a whole race
[587 (jaid). If a man or a woman whose spouse has
428] died remarries, the sang is transferred to the relatives of the deceased man or woman. This "inheritance" of the sang is different according to the sib. By accepting the sang the inheritors must pay 11 of a [417] kaŵ or 7 1/2 of a kaŵ or 5 1/2 of a kaŵ. By kaŵ the number 1280 is actually understood. But it means, however, that

782 But those who use nine parts take in addition to those parts mentioned above two parts of the large intestine and of the small intestine and two parts of the appendix.

It is very hard to describe the sacrificial customs of the Khasi, i.e., to describe them quite exactly, as it is made differently in many cases. And even in the same case, for example for the same sickness or the same trouble, the sacrifices are made differently. One can readily see that in the fact that some use five parts of the sacrificed animal, some even seven parts and others again nine parts. Similar differences occur all along the line. For all cases the "piece" (dykhot) and the "sour thing" (lamjew), as well as "liquor" (iad) are sacrificed.

The method of the sacrifice depends on the relatives, that is on what the custom of the sib is. The youngest daughter is the [428] heiress of the wealth, but she is also the one who is responsible for the sacrificial rites of the sib. It is her duty to preserve the sacrificial rite which was always customary in the family (ha iing). The sacrificer (u synniang) conducts himself according to her instructions. Often many sacrificers are needed, for example at a time of plague or general trouble. Since there are now not too many sacrificers who understand the matter well, many desired sacrifices are omitted. Because of that, the Khasi believe that the rooster (u siar u shan) lives again, because of that the u longduh u longsam (evil spirit) lives again, because of that the Tyrut and the Smer live again, i.e., the evil demonic influences of these spirits become influential again through the neglect of the sacrifices.

After a while a young Khasi with such advanced views married /302/ into the family clan Umliang. Meanwhile 40 years had passed. The old father U Shai was already dead. The piece of land planted by him, as it was not actually family property, according to the special customs of the War had passed on not only to the youngest daughter but also to his son Jacob U Shai and his sisters. On their side they had helped their father in the clearing of the forest. The siblings were Catholic. The young man mentioned above brought a legal complaint against the siblings before the English government official in Jowai a few years ago: the forest made arable by Jacon U Shai and transformed into a fruit orchard had been illegally acquired and is the property of the clan of his wife; he demanded a piece of the land back for the family Umliang and for the other piece a corresponding annual rent must be paid.

In reply the siblings Shai could claim that the affair was past the legal time limit. According to tribal custom the time limit on small matters was 10 years, for greater matters 30 years. In addition the main point on their side was that the piece of land in question was khlau sang, forest of the gods, and the family Umliang could not ask anything for it. For this the Shai siblings lacked witnesses, whereas the Umliangs produced several heathen witnesses for the simple declaration of the right of possession. The case was long drawn out. It was finally decided against the Shai siblings and they were declared deprived of the property. The missionary P. Benedikt Neher now concerned himself with the affair. He brought more than 100 witnesses, all clan mothers or village elders, who were ready to swear that that piece of land was a forest of the gods as long as man could remember. The English judge, whom he informed of this, decided that this was a basis for proposing a revision and change of the judgment, but the Shai siblings had lost all their money in the previous trial to petrifogging lawyers and did not have the spirit to begin again. With oriental equanimity they accepted the loss and thus the affair remained.

/303/ The case is instructive anyway, insofar as it shows that the so-called holy forests are also found in the possession of individual family clans; how they are valued by them as long as they remain faithful to their animistic views and how they are able to make their right of possession to them valid even after years.

3. Customs Concerning the Right of Inheritance

When the clan mother dies, the youngest daughter always receives the inheritance among the Khasi. If for any reason the youngest daughter cannot take possession, her next youngest sister follows. If there are

428 613 no girls, only sons, the inheritance passes to the youngest daughter of the sister of the deceased clan mother. If there are no such sisters or if they have no daughters, the nearest, youngest female relative is next in line. If she has not lived in the family clan of the deceased up to now, she must first spend at least 3 months in the hut of the clan mother in order to be able to enter into her rights and duties. In such cases usually the successor to the office is taken into the hut previously by the clan mother and prepared for the later activity. It can happen that the successor is not even 13 years old and therefore is not of age and capable of marrying. In this case the mother or a sister of the deceased clan mother manages the rule and the household until the majority of the inheritress. But even as a child the latter has the honored name mother; she is called kmie or kmie san.

The great principle, which determines all conditions of inheritance, is that the sons and husbands are excluded from all family property, which is always passed on to the girls, the female world. But what if a fellow or a man creates or acquires property? The case is possible and also occurs.

428 556 /304/ As mentioned, each person must help with the work in his own family clan in order to have a claim on care from the common property. Between sowing the rice and the harvest and other possible common labors there are still many days and weeks. Instead of [464] spending these with archery, hunting or the popular shong kai, or loafing around, a young man can earn money by cutting wood for others and carrying loads for native traders or also for Europeans, since in the mountains nearly everything has to be carried on the back. He can also do work in the fields or gardens for pay for others outside his clan or carry on a small trade by buying wares at the market such as dried fish, betel nuts, pepper leaves and such, and carrying them a few days' journey away to the markets in the interior of the mountains where these items are not otherwise available and selling them there for a profit. What the man earns in this fashion is his property and is not counted as part of the clan property. An industrious man can thus gradually earn enough money to rent a rice field. Through sale of the surplus crop, he will finally have enough so that he is able to buy a rice field himself, which is also 428 his property. If such a man dies unmarried, the inheritance passes to his mother. If he is married then he can, if he wishes, found a clan property for his family who may be poor and without property. The property will then pass to the youngest daughter and be passed on then in the usual manner of inheritance. Thus everything finally

returns to the hands of the women. 428

The following example may explain the customs involved here and further sift them out even though it scarcely throws a pleasant light on the dissensions which have been introduced among the Khasi people as a result of the divisions of the various Christian religions which are striving for their conversion.

In the village Kyndongtupér, a man had gradually acquired some 428
property for himself with 15 oxen and cows, /305/ a decent hut and 797
furnishings and 3 beautiful rice fields, large enough to sustain a family 613
clan. After his death the youngest daughter of his sister, named Ka Pliang Shai Syndūr, was considered the valid heiress. She was still under age and her mother was already dead. As a result a sister of this mother, named Ka Pliang Shai (11)took over the management

11. Pan and Syndur are Khasi names; Pliang Shai is the name of the family, clan; literal meaning: shining plate.

of the inheritance and lived with the little heiress in the clan hut. There was no doubt that the latter would receive the entire property after she reached her majority. After a while, a young Catholic, U Salomon Taruh, wooed for Syndūr's hand. Thereupon the older sib- 428
lings, a brother and a sister, both of whom belonged to the Methodist 797
Church, became enraged. In spite of all the hostility, the young girl 671
stuck to her decision, married Taruh and became Catholic. The 613
young married couple had to flee from the clan hut because of the anger of the siblings. The latter sought to have the sister disinherited, but the other relatives involved would have nothing to do with this. They were so carried away by their anger that they did what was considered a crime even in the eyes of the heathen: they drove the cattle away secretly and sold it; likewise they cleared out the clan hut and even sold two rice fields. On complaint to the competent court, Syndūr was finally granted her right; she could take over the clan hut and the family property which was meanwhile greatly diminished.

Although the Khasi who have been converted to Christianity do not need to be bound by the laws of succession in inheritance and although this is often recognized by the heathen Khasi, there is no hindrance put in their way by the Catholic Church to following their native tribal customs in this matter. The Catholic Khasi themselves do not wish to deviate from them: /306/ a dogged attachment to ancient customs and a respect for them are in their blood. Here are a few examples.

In Nongbah the Catholic clan mother ka Johanna Sunah, wife of U Andreas Tubru, died without leaving any female descendants. It would

428 have been understood if the only son U Johannes Sunah, according
797 to the ruling custom of Christians elsewhere, had claimed the con-
671 siderable inheritance of rice fields, forest, and huts. A serious ob-
613 jection would not have been expected either from the officials or the relatives. Johannes was also spoken to about it in this fashion, but in vain. He could not conquer the inner revulsion of acting against ancient tribal customs for a temporal advantage. His simple answer was: "If I am a good Catholic, God will bless me in other ways without my going against our ancient customs." And so matters stood. The whole property went to the youngest daughter of the sister of the deceased; this branch of the family was still heathen. Through industry and economy Johannes finally acquired his own household with a goodly piece of land.

The Catholic Khasi even get rid of possessions readily which they already possess if the tribal customs demand it. It happened unfortunately several years ago that both the wife of the chief teacher of the Catholic Khasi public school in Shillong, U Thomas Byllun, as well as the wife of the cook of the mission station there, U Sebastian Shiah, were both carried away by death within a short time. Both men had acquired very nice property by their industry. According to Khasi law they had no further claims on their children who were still quite small. They belonged to the clan of their deceased wives and had to be taken by them and raised. According to Khasi law, the property that they had acquired also passed to the youngest daughter. Willingly each of them handed over the children and the interim management of the property to the relatives of the deceased wives, took the few clothes and purely personal possessions /307/ with them and sought to begin again from the beginning in the rented half of a hut. To my question, whether that had been hard for them, they answered with quiet matter-of-factness: "But that is the custom among us Khasi."

It is not necessary to emphasize especially that such respect for the tribal customs has made only a favorable impression on the Khasi who are still heathen.

Gurdon relates (12) that the clan mother loses her position in the

12. The Khasis, p. 83.

family when she changes her religion, for example at her conversion to Christianity, and that the youngest daughter takes her place. The justification for this lies in the fact that she then no longer belongs to the religion and cannot offer the customary family sacrifices.

Because of her whole position as guardian of the inherited religion and 428
customs, it is not frequent that such a woman breaks with the ancestor 613
cult. If this does happen, it does not necessarily mean that she loses 797
the entire property. That depends really on the position the other 671
members of the family take. If they are all still firm heathens, who wish to have nothing to do with Christianity, they can force the clan mother to give everything up. The high respect for her is frequently so great, however, that either the whole clan or at least a part of it decides to take the same step and change religions with the clan mother. The part that remains heathen will certainly propose a division of the family property. This is also possible in other cases.

4. Division of the Family Property.

Although it is rare, the weal and woe of a family-clan can re- 613
quire that a family-clan be split into two clans /Clan/ and that a 578
division of the common property be undertaken. The basis for this is 688
if the family /Geschlecht/ becomes too big, if the elders in the family council /308/ are no longer united and hate and revenge threaten to destroy, if a part of the clan /Clan/ tries to seize the better fields by violence and refuses to deliver the harvest for the common need, if one branch has brought the whole clan /Sippe/ dishonor and shame by false oaths, incest, revenge, treachery or some other severe crime. Only the guilty party will be excluded from the clan /Clan/ in such cases, if he remains stubborn and impenitent. But if he begs for forgiveness with his lips and participates in the expiatory sacrifice, forgiveness will not be refused him. But a certain inner tension and bad feeling often remain behind.

At the conversion to another religion, it often depends on how the 797
clan mother and also the family elders are inclined towards the re- 428
ligion in question, and also on who is changing religions. If it is only 425
brothers, sons, nephews, or grandsons, of the clan mother, a division 613
is out of the question, since the men are not capable of inheriting. But if it is the youngest or next youngest daughter or even the sister of the clan mother, then a division of property can be undertaken. A clan mother after all is so attached to her child or her nearest blood relatives that she would not like to push them entirely away from herself unless she were completely set against the religion in question and angered. If that should be so in individual cases, the heiress concerned will still consider, whether it is not more advisable to wait to change her religion until the clan mother has closed her eyes and she then has free play. Then that which was mentioned at the conclusion of the previous section can occur.

8: Gurdon G-3 (no date) 1904 AR7 Khasi AR7

—the *Shyngkup*, or porch, being flush with the ground. The *nengpei*, or 342
centre room, is approached by a flight of steps. There are no windows, except one, which is bored on one side to admit light and air,—this is called the *pongshai*. Both Khasis and Syntengs, like other Indo-Chinese 524
races, are much addicted to gambling, and drinking to excess is a 273
national vice. Christianity has, through the agency of the Welsh Cal- 797
vinistic Mission, gained a very striking extension, and may be said in- 177
deed to be leavening the whole nation. Schools are numerous, and are pretty well attended by girls as well as boys. The Christians, and those who have come under the influence of Christianity, have adopted a high standard of comfort, and their houses resemble English cottages more nearly than the huts with which one is familiar in India.

Agriculture.—The Khasis do not use the plough; they cultivate their 241
fields with a peculiar-shaped hoe, or *mohkhiew*. They cultivate rice in the valleys, the rice being sown broadcast and the fields irrigated often after considerable labour. They also cultivate hill rice on the uplands, which they sow broadcast. The potato, which was introduced into the [177]
Khasi Hills by Mr. David Scott about the [439]
year 1830,[1] is extensively cultivated and forms one of the principal articles of export. Job's-tears (*Coix lachryma*), several kinds of millet, Indian-corn, the *Sohphlang* (*Flemingia vestita*), are also largely cultivated. The valleys on the 245
southern slopes of the hills have extensive orange groves, the oranges, especially those grown in the neighbourhood of Shella, being famous for their quality. The betel, vine, and areca nut are also largely grown on the southern side of the hills and in the low valleys, these plantations being irrigated by elaborate systems of aqueducts. The leaf of the bay tree (*'latyrpad*) is collected, and is exported to the Sylhet plains. The [439]
Syntengs differ from the Khasis, in that they make use of the plough. Both Khasis and Syntengs are industrious cultivators, and they possess a certain rough and ready knowledge of the uses of manure. A more detailed description of agriculture in these hills will be given in the monograph.

[1] Khasi and Jaintia Hills Administration Report for 1875-76 by Colonel Bivar.

2. *Matriarchal customs and law of inheritance of property.*—The 611
mother is the head of the house, and is both owner and the custodian of 428
the family property as long as she lives. Males can own no property amongst either Khasis or Syntengs except self-acquired property. On the death of the mother, in the case of the Khasis, the family property passes to the youngest daughter. According to some authorities, however, the property would in practice be divided amongst all the surviving daughters. Failing daughters, the property passes to the youngest niece, and failing a niece, to the youngest female cousin. The same

St Gordon G-3 (no date) 1904 AR7 Khasi AR7

611 custom prevails amongst the Syntengs. Inheritance to the post of Siem
428 (or chief) also passes through the female line, there being special customs of inheritance for each of the different chiefships.

3. The Khasis are divided into clans, or *kur*. These clans are
614 strictly exogamous. Some of these clans derive their names from animals, insects, trees or fish,—*e.g.*, the *tham* clan, *tham* meaning a crab; the *shrieh* clan, *shrieh* meaning a monkey; the *rani* clan, so called from a fish by name *rani*; the *diengdoh* clan, *diengdoh* meaning a certain tree. There are other instances also. In each instances, the clan is said to have sprung from the animal, fish, or tree, as the case may be. There thus appears to be a trace of totemism amongst the Khasis, although now-a-days their totems are not worshipped, nor do people abstain from killing, eating, or utilising them. A man when he marries does not cease to belong to the *kur* or family of his mother, but his children belong to the *kur* of the man's wife. Frequently the husband merely visits his wife at her mother's house. It is seldom the case that a man takes his wife to his own house, certainly not until several children have been born.

As might be expected, owing to the influence of the marriarchate,
562 Khasi and Synteng women enjoy a much greater share of liberty than is usually the case with the sex. Although not wishing to make any general insinuations, there can be no doubt that Khasi women enjoy considerable freedom in their sexual relations. Women do all the trading, and like their Manipuri sisters make all the bazar purchases.

4. *Ancestor worship.*—The Khasis propitiate *Ka Iawbei*, the first
769 maternal ancestress of the clan, by sacrificing a pig; they also sacrifice yearly to *U Suidnia* (the departed maternal great-uncle). Also when a family is in trouble, *U Thawlang* (the departed great-grandfather) is propitiated. Ancestors are further worshipped by the erection of memorial stones. These memorial stones will be noticed separately.

5. *Birth customs.*—At the birth the navel of a child must not be
844 severed by any instrument made of iron or steel, but by a sharp splinter of bamboo. The placenta is placed in a pot and is kept inside the house till the ceremony of naming the child takes place. As long as the placenta remains in the house, the latter is *sang*, or taboo, to anyone except the members of the family. On the day of the ceremony of naming the child, the father removes the placenta and buries it outside the house. Having done this, the feet of the father are washed with water before he re-enters the house. When the ceremony takes place, powdered rice is placed on a sieve (*u prah*) and a small bow and three arrows if the child is a male, and a *weit* (or *da*) and a star or (cane strap) (worn across the forehead when carrying a load by the Khasis), if the child is a female.

[p.19]

CHAPTER II

Descent, among Khasis, is counted through the mother; residence is also matrilocal. A woman lives with her mother from her birth until some time after her marriage. After one or two children have been born her husband may build for his family a house on the village land, in the village of the wife; this house becomes her property. The ancestral house goes to the youngest daughter. In the absence of a daughter the next youngest sister's youngest daughter becomes the heiress. Rarely, a man will take his wife to his mother's village. This case will be considered later.

A man is born, in the house of the mother's mother, or if the parents have built a separate house, in the house of his mother. He continues to live there until his marriage, when he generally goes to live in the wife's mother's house, whether it is in the same village or a different village.

The mynsi U Subu Rai married in the village of Mawphlang, where his mother also lived, and built the house, which is known as his house. It is, technically, the property of his wife Ka Shyngoh and will be inherited by Ka Dhoiben, and thereafter, by Ka Eliotina. The house of U Subu Rai's mother, Ka Jin has been inherited by Ka Eiriben, and will go in the next generation to Ka Pyn. If the latter has no daughters, the property will go to Ka Drei and failing her heiress, to Ka Flow and then to Ka Lamih. If she has no issue, it will pass to her sister Ka Lasok and so on to Ka Lajor. If Ka Lajor has no daughters, the property will go to Ka Jem's family to her youngest daughter Ka Aiben. As she has only sons, the next heiress will be Ka Symon, and if she predeceases Ka Aiben or has no daughters, the girl Ka Riwlem will inherit next. If

428 she does not have any daughter, the property will pass to the female descendants of sisters of Ka Long, as her elder sisters Ka Leimon and Ka Leiban have left no daughters. It is therefore necessary to distinguish carefully between an elder and a younger sister, and also similarly between sisters of the mother. The generation of the women of the same house and extended family requires to be noted with care.

The youngest daughter and heiress is termed the Ka Khadduh. As Gantlin remarks the "Ka Khadduh is the custodian of the family property, not the full heir in the sense known to other systems of law, but a limited heir. She is
[64 responsible for the performance of religious ceremonies.....; she cremates her mother, and if she be Ka Khadduh of the whole family, she puts the bones of all members in their final resting place under the stone (mawbah) of the clan. The expenses of this ceremony are considerable and for this reason she gets a larger share of property, or in some cases a piece of family property in addition and apart from her separate share. Members of the family who are unable to earn for themselves and have no children to earn for them have the right of being fed at the ing-Khadduh" (house of the heiress).

429 The management of the property is however vested in the men of the family. The ancestral property of the family of myatri U Subu Rai's mother was under the management of U Joi, in his mother's life-time; then, on the death U Joi, the next brother U Doi became manager. After U Doi, the management came to U Subu Rai. After him, the authority will pass to U Hojen, as U Sumbuni is dead and then to U Nodem. Any sons of Ka Pres and other sisters will not get any precedence over U Nodem. As the senior U Kni of the Iaughlah Kur, U Subu Rai is also the manager of the common property of the Kur.
[427] This land has been leased out to various persons and the total income is divided among the different houses of the Kur.
431 Whenever there is money to be distributed U Subu Rai calls together all the representatives of the Iaughlah houses and

Ik Chattopadhyay 3-4, 5 (no date) 1941 AR7 Khasi AR7

divides equally. U Subu Rai explained that each house counted as a separate unit. Thus if Ka Jem, Ka Jin and all their daughters were alive, the married daughters who lived in a separate house, namely, Ka Laimon, Ka Laibon, Ka Aimon and Ka Hoiman of Ka Jem's house, and Ka Phre of Ka Jin's line, would each get a share. But Ka Jem and her Ka Khadduh Ka Aibon who lives in the mother's house would get only one share. So would Ka Jin, Ka Eiribon and the unmarried daughters of the latter. The descendants of Ka Lung would get seven equal shares for distribution to each house, and not two shares first, divided later into shares corresponding to the number of daughters for Ka Jem's and Ka Jin's house. The manager does not get any share of the collections. Authority [429] [428] for the management of the ancestral property therefore passes from one male to another, in the extended family, and the Kur, in a manner which necessitates a clear distinction of seniority and juniority of brothers, among themselves and also of sisters with regard to brothers.

The case of succession is similar. Gurdon notes that the Siemship in Mylliem State passes from a man to his next brother, and "failing such brothers, by the eldest of his sisters' sons; failing such nephews by the eldest of the sons of his sisters' daughters; failing such grand nephews by the eldest of the sons of his mother's sisters" and so forth in the female line. In Nongkrem, the son or similar male relative of the High Priestess becomes by delegation a Siem. The office of the High Priestess passes from a woman to her eldest surviving daughter; and failing daughters to the eldest daughter of her eldest daughter; failing daughters of her eldest daughter, to the eldest daughter of her second daughter, and so on. This is the customary line of succession, and is stated by Gurdon to be "uniform in all cases" practically.

Neither levirate, nor sororate are practised by the Khasis. Widows are stated (G) quite often not to remarry if there are daughters. There is no question of the control of the property

13: Mukherjee E-5 (1954)1958 AR7 Khasi AR7

596 extended form more often when the children of the deceased sisters of *Ka-khadduh* reside there. This extension is on the mother's side and is affiliated through the extension of mother-child relationship.

Additional members like widower brothers or widowed sisters make the Khasi family a composite one.

In a Khasi family father, mother and her brother are very important. Father who is regard[1] as *Mynder* (stranger) or *Ushong kha* (begetter), has also the position of *Kynrad* (master) of the house (set-up by him). He is the executive head and the mother is the *dejure* owner of the household.

177 178 604 593 [428] Modern conditions and spread of Christianity have greatly affected the Khasi society and changed the Khasi ways of life but have failed to alter the traditional mode of inheritance even among the Christian Khasis. Another important fact which is apparent in the Khasi families, is the change of the status of the mother's brother (*Uknii*) in his sister's house. His influence has greatly been diminished due to clash with *Ka-Khadduh* (heiress). He has almost lost his control over his sister's [562] family. This has made the women exert their status to a danger point. Consequently, some amount of maladjustment in the relationship system, moral depravity and disintegration loom large in the family horizon.

596 613 Family is the core of Khasi social organization and the closeness of familial kin with the members of the sub-clan is due more to the fact that sub-clan owes its development to the family. A *Shi-K'poh* (member of sub-clan) is a secondary relative and can easily be approached for any help.

614 The functions of the above mentioned social groupings are as follows :

Clan (*Ka-Kur*)—It regulates marriage. It being a larger non-residential kin group contact between its members is infrequent. The amount of social participation needed on certain level to intensify the relationship among its members falls far short of. But nevertheless, there existed among the members

614 764

[1] [Should read: regarded.—Analyst]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 lands is the *kni* (maternal uncle of the youngest daughter of the main family,
423 or branch of the clan), whose house '*ka iing khadduh*,' or last house, is the place
614 for performing all the religious ceremonies of the clan, and is also called *ka iig seng*. All the members of the clan are, however, entitled to share in the produce of any of the clan lands they may cultivate. No clan lands can be alienated without the consent of a durbar of the whole clan" (Gurdon, 1914, p. 88).

178 Theoretically we can assume that the land was owned by the family
423 (precisely, *iing*, the matrilineal descent group at the lowest segmentation, the structure of which will be discussed later) who first claimed
428 the right to the land, and was managed by the maternal uncle of the
614 youngest daughter, the heiress entitled to the property. In course of time, with the increase of the descent members and with fissions of the descent group, this land was inherited through the youngest daughter's line, but other members who had become segments of the main descent group had a right to use the land, so long as they remained in the same area. Newcomers who belonged to another clan were not granted the same right and had to pay rent. According to the information I was able to collect, even people of the same clan could not claim the right to use the land, unless they were the direct matrilineal descendants of the women who first owned the land. In this sense, the descent group solidarity at a lower level is much stronger than that of the Garo.

Therefore, newly possessed or purchased land is always owned by the individual family (*iing*, descent group). This Khasi conception of land ownership produces a picture of predominant private ownership of land, combined with high geographical mobility of the population (see p. 112). In such circumstances, it seems that even the land called "clan land" has been alienated or sold frequently, and has developed small holdings to suit the small segments of descent groups. In particular, when the entitled owner moved away to another area, the land was sold. For instance, in Sohkynduh, the maternal uncle of Sor (mentioned above) purchased the land indicated above about ten years ago from a family of Siem Lyngngoh who left for another village. This land was originally purchased by the Siem Lyngngoh from the Dkhar to whom the land belonged as part of the clan land.

Under this system, clan ownership of land can develop only (1) when the members of the descent group remain in the same community for a considerable period and (2) when there is sufficient land to acco-
178 modate all members. I think these are the main reasons why land-
423 holding at present among the Khasi is found to be in small descent groups—in one household as in Kongton in most cases, and this I call
428 private ownership. For the second reason, further explanation is

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

necessary. The chances of acquiring a piece of land nowadays are small, except for very successful men, and usually the size of the plot is only just enough to maintain one household. When this land is passed on to the next generation, the youngest daughter will hold the title to it. This fact tends to exclude married elder sisters from the right to use the land, since it is not sufficient for more than one household. Thus the ultimogeniture succession rule seems to have developed more sharply and to have encouraged limited inheritance in conjunction with the shortage of land. 178 423 428

This tendency creates unbalance in the economy of the households within a community. It is a usual picture in Khasi villages, for the bigger and well-built houses to be occupied by the youngest daughter's family, while the elder sisters reside in poor huts. Youngest daughters are usually landowners, while their elder sisters have often to become day-labourers after their marriage, unless their husbands are capable men, or their fathers wealthy enough to give them some share of their acquired property. On the whole, the variations at present between rich and poor are considerable in a Khasi community, in comparison with that of the Garo, where the economic condition of each household in a village is more or less similar. These differences are not only a matter of economic organization but arise from the nature of each social structure. 178 184 423 428 556 [171]

The economic and social patterns of Sohkynduh and Kongton are very similar, but their dialects are slightly different: my interpreter, who came from Cherrapunje, could work quite well at Sohkynduh, but at Kongton he found some difficulty, especially with the speech of the old men, and with their religious expressions. The head man of Kongton, who was quite accustomed to the Cherra dialect, acted as an interpreter for us. Such differences in dialect in the Khasi Hills are common phenomena; it is said that every valley has its own dialect. Differences are found not only in speaking, but also, to a certain extent, in culture and in social usages. 197 [124]

II. Village Endogamy

One of the outstanding features of Khasi social organization is the predominant tendency of endogamy on the level of the village, which contrasts with the structural orientation of the Garo village exogamy. This is closely connected with the distributions of clans and the nature of the descent groups. 582 621 [171]

The Khasi population consists of a number of *kur*, matrilineal clans, whose members consider themselves to be descended from a common ancestress. The members of the same *kur* have a common 614 [765] [769]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

society? Among the matrilineal Central Bantus, Richards says that 591
the determining factor in residence at marriage is the marriage payment
or the type of goods and services which the bridegroom gives (Richards,
1950, p. 249). However, the Khasi have no such custom in the mar-
riage contract, it is therefore out of the question to explain the two
types of residence in this way. In the case of the Khasi, the determin- 182
ing factor is the type of marriage with relation to the rule of inheritance 428
and ownership of property, which is clearly related to the structure
of the *iing*. Khasi marriages can be divided into two categories i.e., 581
marriage with an heiress and with a non-heiress. Marriages with an 591
heiress must be uxorilocal. This accounts for category 1 or 3 of the 602
household pattern. On the other hand, marriages with a non-heiress 613
become neolocal and correspond to category 4 of the household unit.

IV. Marriage with the Heiress

A man married to an heiress, usually lives with his wife's parents 182
and her unmarried or divorced brothers and sisters. For a man, life 428
after marriage under such circumstances require great adjustment
and endurance. The husband's status is especially weak when a male 591
member of the wife's kin lives in the same household. The manage- 592
ment of property and all economic activities are entirely controlled 593
by the authority (wife's brother or maternal uncle) of the *iing*. The 602
husband works in the wife's field under constant supervision from 604
this authority. Both economic activities and domestic affairs are 613
always under the management of this authority. The children have
more attachment to, and are more obedient to, the maternal uncle
than to the father. The tie between the uncle and the nephew is so
strong that the father is rather like an additional member of the
household. He is the last person to be introduced to visitors. [574]

This family system is clearly reflected in the daily behaviour. 123
When we visited the Khasi household of a youngest daughter, if a 574
man (obviously the husband) came first to greet us, he always said
"please wait, my wife (or mother-in-law) is coming." And it was 592
the wife who entertained us, offering tea or pan and discussing matters 593
with us, while her husband remained silent in the corner of the room, 602
or in the next room. If her uncle or brother was there, *he* would be 604
the person who talked to us, while his niece or sister served us. In
such a case, we were seldom introduced to the husband. When I was
working at Shella, I happened to stay in such a family. I had hardly
any opportunity to talk to the husband during the two weeks of my
stay. He left the house very early in the morning and came back 592
late in the evening from the fields. While he was at home, he was 593
604

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

592 always somewhat outside the family conversation which was centred
593 on the maternal uncle and his sisters, nephews and nieces, by whom
604 I was well taken care of. This is somewhat similar to the situation amongst the Cewa and the Yao of the Central Bantus, which have what Richard calls 'the detachable husband' (Richards, 1950, pp. 233-35, 248), though the parallel is not by any means exact.

• 428 There is, therefore, inevitably an element of tension in the relations
581 between the wife's maternal uncle (including parents-in-law) and the
586 husband (son-in-law) and this tension makes the latter's life extremely uncomfortable. This awkward position is well shown in the divorce
[604] rate. At Kongton (see List 9), out of 61 couples (house-owners and
[606] their spouses), the number of persons who had experience of divorce was 33 (female 15, male 18) and those married more than twice
[592] numbered 19 (female 7, male 12). Out of 61 couples, there were only
[593] 31 in which neither husband nor wife had been divorced. In my census of Jatinga village, 70 per cent of all divorce cases were marriages to heiresses. In general, the period when divorce occurs more frequently is before a couple get children and after the wife has passed the child-bearing age. A marriage breaks up either through the action of the wife or of the husband, but generally through that of the wife. However, the state of separation which I presently describe is brought about by the husband, though later it results in a divorce from the wife. Divorce does not mean a great catastrophe for a Khasi wife, especially if she is an heiress and her husband's economic
[587] contribution is not significant. Moreover, in this society remarriage is as easy for a widow or divorcée, as it is to divorce. In the villages of Sohkynduh and Kongton, the couple who wants to divorce has only to throw a few Annas together in the presence of some witness, usually an elderly man.

581 In addition to divorce, there are many actual separations of husband
and wife, of short or long duration, when the husband runs away from
593 his wife's house to his sister's. Though it does not always end in divorce, considerable number of husbands have a strong tendency to spend most of their time at their sister's house. Khasi women often told me, "I don't know why he does not come back to my place." I have often found the husband staying at his sister's house only a few houses away from his wife's, without any particular reason. They are obliged to see each other every day whether divorced or separated. This kind of ambiguity in the marriage relation seems to have an important correlation with the Khasi social structure, combined with the village endogamy. The man and and wife have grown up together from their childhood in the same village and known each other very well. Hence their psychology cannot clearly distinguish the marriage form as a newly-established independent social relation-

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

ship. They still live in the same familiar atmosphere as before their marriage. The implications of this ambiguity in the married state are considerable. Particularly the husband's uncomfortable situation, when the wife is heiress, encourages him to take marriage less seriously. 581 593

A husband who undergoes hardship in his wife's house, finds himself as the authority in his sister's house; if he is not the authority, he can find at least a respected position as uncle or brother. In the case of a man of authority in the *iing*, the tendency for him to regard his *iing* as more important than his married life is proportionately stronger, as I will discuss later. Hence the most unstable and unsuccessful marriages are those between the heiress and the man of authority. This is one of the reasons we often find among the Khasi: a brother or an uncle, who is already married, acting nevertheless as the head to a family *(iing)* and as a member of its domestic group. This means that he is in a state of temporary separation or divorced. Among the Ashanti, a man and his wife's brother are never found as members of a common household (Fortes, 1950, p. 262), but among the Khasi, on the contrary, a man and his wife's brother are often found as members of a common household. In such cases, however, the brother has no wife, or never brings his wife to his *iing*. Therefore, a man and his wife and his sister never reside together. As far as the residence of women is concerned, the Khasi keep to the strict descent rule; two women who belong to different descent groups never live together. This point differentiates the Khasi residence pattern, in which social structure is involved, from that not only of the Ashanti but also of the Yao where the head of a descent group can bring his wife to his sister's household, though, among other members, uxorilocal marriage is the rule. These differential aspects of matrilineal systems will be discussed from a more theoretical point of view later. 581 591 592 593 602 604 613 428 [171]

In addition, should a Khasi man even succeed in spending his life with his wife's kinsmen, as soon as the wife dies, he will usually return to his *iing*, that is, to his sister's house, where he is received warmly and where he often acts as the *de facto* authorithy, as in the similar situation of divorce and separation. Thus the strong matrilineal structural principle tends to orient a man towards his own descent group, the *iing*. 602 613

The man's attachment to his *iing* is very great throughout his life. In this regard the Khasi differs from the matrilineal Negri Sembilan Malay. Among the latter, returning to the matrilineal kin is regarded by the man as an imposition rather than as the enjoyment of a legitimate privilege (see Swift, 1958, p. 157).[1] This difference 171 592 602 613 428

1. He presents this fact as one of the reasons of the durability of marriage among the Negri Sembilan. Indeed, on this precise point they differ from the Khasi where marriage is rather unstable. [581]

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

171 seems to come *firstly* from the different residential arrangement on
592 marriage: among the Negri Sembilan a man marries into his wife's
602 group, i.e. his wife's village; being thus separated from his kin, and
613 as a result of the physical absence of his wife's brother or maternal
• 428 uncle in his domestic family, he enjoys considerable rights in his wife's household—as Swift states, he is 'master in his own house.' On the other hand, since among the Khasi the man stays in the village where his mother's (or mother's successor's) house is, even after his marriage, his relation to his natal house is preserved; *secondly*, from the structural difference of organization of the descent group. Among the Khasi, the *iing* is always the centre of the descent group, based on unigeniture succession and inheritance. Hence, the core of the descent group is always found physically in a particular household, whereas among the Negri Sembilan, the descent group is *not* organized on a *household* level, but is a much wider organization, including apparently many households. Membership of an actual household and of a descent group are at different levels. To marry out and become a member of his wife's household means for the man the transfer of his household membership. Likewise, his sister's husband becomes a member of his sister's household. Thereby he becomes a secondary member of his sister's household after marriage though he keeps his memberhsip in the descent group to which his sister belongs. Among the Khasi, membership of a descent group always corresponds to membership of a particular household. The Khasi man can always demand his rights at his natal house primarily, as he is a member of that descent group. But it should be noted that he has this right only in his mother's (or mother's successor's) household, not his other sisters' (non-heiress') and mother's sisters' households (unless one of them is successor of his mother), though they may belong to the same descent group. These matri kin's households are considered as separate *iing* (strict functional descent group) from his.

586 Indeed, sometimes a man cannot find his *iing*, because his mother
613 died leaving no daughter to succeed her, or his sister died leaving
736 no successor, and his *iing* became extinct. Such a case occasionally
428 happens when a man becomes a divorcé or a widower as he is getting old. Then he has to face a serious social and economic condition. In divorcing, he has to leave everything he owned, his earnings including the house which he built, and even children . . . really he has nothing left him except his body.[1] Such a wretched man collects some timber and makes a small hut for himself, though sometimes lads who sympathize with him help him to build it. Unless he finds some woman

1. A widower has an alternative solution—to remain in his late wife's household till he marries again, though his position is not comfortable there.

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

whom he can marry, he has to endure this miserable lonely life, while often in the same village his former wife is living in a well-built house with her children and her matrilineal relatives as before. Households of 3, 13 and 30 of Sohkynduh in List 6, and 23, 29, 38 and 56 of Kongton in List 9 are instances of such cases. It is really a pitiful picture to see such a man, aged and poor, living all alone. 586 613 736 428

V. Marriage with the Non-heiress

Outsiders who come to the Khasi Hills are often impressed by the Khasi husband's miserable status and express surprise at the high divorce rate. This is mostly due to exaggeration based on the marriage with the heiress. However, where a man marries a non-heiress, there are many successful marriages with paternal authority. In most of these cases a man's status as a husband and as a father is stable. First of all, the domestic residential unit is an elementary family. From the onset of the marriage the husband's labour is of great importance to his family, since a non-heiress usually has no economic background, i.e., no dowry or inherited property (see p. 105). The economic circumstances allow a man to be the *de facto* head even though whatever he earns belongs, as a rule, to his wife. A man who succeeds at the beginning of his married life is respected and honoured as father in his family for the rest of his life. By this type of marriage, the man's status is firmly established. It is therefore a more secure form of marriage than a match with an heiress. 184 428 593

In such a marriage the children love and obey their father. The management of his acquired property will be taken over by his son and the property will be handed over to his daughter. Thus the paternal authority is as well established in this form of domestic family, as in a patrilineal family. However, the great difference from a patrilineal case is that the husband/father status is not permanent as the authority of the family. Theoretically he exercises it in the absence of a male adult member of his wife's *iing* (actually founded by his contribution), in other words, till his son is grown up (see p. 12). In the next generation this will form an established *iing* in which the husband of his youngest daughter will suffer again. [613]

The household of this kind of marriage with a non-heiress actually enjoys a considerable degree of independence from the descent groups of both wife and husband. If a man who has established a matrimonial life independent of his wife's natal *iing*, is not the authority of his natal *iing*, his relation with the latter usually becomes weaker. Economic and residential factors make it possible for the men to make the considerable shift from his *iing* to his wife's *iing*, and though 592 593 613

15: Nakane E-5 (1955-1956) 1967 AR7 Khasi AR7

178 no polygynists, though there were many personal temporary illicit
184 relations or love affairs.

It is true that even in interior villages polygyny is rapidly decreas-
595 ing. In the two villages I found only two cases of polygyny: a man with two wives in Sohkynduh (Josio in List 6, whose wives are 26 and 32), and a man with three wives in Kongton (Jubongrai in List 9, whose wives are 8, 20 and 52). These cases appeared clearly as cases of polygyny which the villagers recognized as such, speaking of them quite differently from the way they would have spoken of lovers, calling them wives and husbands. Of course, the first wife socially outranks the secondary wives, as *ka tynga trai*, and the term *ka tynga tuh* is used for the latter, as Gurdon states (1914, p. 80). The difference being that the first wife has a legal marriage ceremony while the others have not—*ka tynga tuh* means literally 'stolen wife.' About
585 the marriage ceremony, Gurdon gives a detailed discription (*ibid.*,
595 pp. 127-130) and says there are three forms of marriage ceremonies, *Pynhiarsynjat*, *Lamdoh* and *Iadih-hiad*. The first and second forms are considered the more respectable; the last one is resorted to by the very poor who cannot afford the greater expense entailed by the first two. Unfortunately, during my stay in these villages, no marriage ceremony took place, but villagers described to me what seems to be the *Iadih-hiad*, where only a fowl is sacrified, and the whole procedure is much simpler than that described by Gurdon. However, whatever the complexity and richness may be, there is a distinct line between having a ceremony and not having it, and this draws the distinction between the status of the first wife and that of the secondary wives.

• 428 Nevertheless, this distinction has more of a social bearing than the
595 legal bearing it has in a patrilineal system. Since they follow the matrilineal system, the legal distinction between the first wife and
851 the secondary wife does not affect their children's status and their property rights, at least not in the villages where I worked. The children's social locus is determined by their mother. The children (particularly the youngest daughter) have the right to inherit their father's acquired property which is automatically under their mother's ownership. If the polygynist father has acquired property by working their mother's field, or in trading on behalf of their mother, whether she be the first wife or the second, this property undoubtedly belongs to the children of that wife, not to the first wife alone. The father's physical locus at the time of his economic realisations is the decisive factor.

591 The Khasi polygynist, without bringing his wives into one house-
595 hold, alternates his residence among them, in turn or according to his temper. This practice is similar to that of the Trukese described by Goodenough (1951, p. 123), and quite different from that of the Garo

16: McCormack E-4,5 (1956-1958) 1964
AR7 Khasi AR7

[P. 106 A]

group of matrilineal and Mon-Khmer-speaking people 101
who claim as their ancestral homeland the present- 131
day United Khasi–Jaintia Hills District (within ap- 197
proximately 90° 47′ and 92° 52′ E. and 25° 5′ and
26° 5′ N.). This group includes the Jaintias (also 101
Pnar or Synteng) in the southeast, who differ from 184
the Khasis primarily in their duolocal residence pat- 162
tern and less virulent forms of sorcery. (The Hadem 563
in eastern Jaintia are a Kuki people.) It also includes
the Lyngngams (also spelled Lynngam) in the west, 59
who practice migratory swidden agriculture and cer- 154
tain peculiar funerary rites, and are said by Ehren- 24
fels (1955) to be culturally intermediate between 764
Khasis and Garos. Finally, it includes Bhois, Wars, 114
and upland Khasis, which terms are primarily terri-
torial. Bhoi country is the north-central part of the
District, and is culturally complicated by the presence
of Mikirs, Lalungs, and Nepalis. War country spans [428]
the entire southern length of the District, so that
Wars divide into Jaintia Wars and Khasi Wars; of
these, the Khasi Wars have traditionally transmitted
property to sons as well as to daughters. The upland
center of the District is the country of the Khasis
proper, those whose culture provides the most useful
model for interpreting the variations found elsewhere.
[For general reference on all categories of Khasi cul- [113]
ture, cf. Costa 1936 and 1937; also Gurdon 1907,
especially for data on regional variations.] **Geography.** 133
The District is 5,554 square miles of hilly tableland, [131]
intricately dissected by numerous rivers, and marked
by significant ecological variation over very short
distances. The tablelands step gently downward north
from Shillong Peak, which at 6,445 feet is the highest
point in the District, and over about 55 miles ease
into the Brahmaputra valley where this is some 250
feet above sea level. To the south, the land slopes
more steeply downward for about 20 miles, and then
drops abruptly, in cliff and steep-slope formations,
to the Ganges sea-level delta that begins at its
north with Sylhet. The annual southwest mon- 132
soons drop torrential rains around Cherrapunji and
Mawsynram villages (for Cherrapunji, a record 805
inches in 1861), but then, reaching Shillong 33 miles
to the northeast, provide only about 100 inches per
year. Rainfall is again greater in Bhoi, which shares
the Brahmaputra valley climate. Climate is temperate
on the high Shillong plateau, where it seldom freezes
and never snows. To the north, climate becomes sub-
tropical, forest is jungly, and fauna abound. The cli-
mate to the south is also subtropical. [Cf. Hooker [113]
1891: chap. XXIX.] **Linguistic affiliation.** Khasi is 197
one of the major Mon-Khmer languages, related to
Mon, Khmer, Semang-Sakai, Nicobarese, and Pa-
laung-Wa. The major Khasi dialects are Khasi, Jain-
tia, and Lyngngam, to which Grierson adds War.
Further minor variations occur from village to village.
The Khasis had no script until 1842, when the roman [212]
alphabet was successfully applied to the Cherrapunji
dialect of Khasi proper. [Cf. Rabel 1961; Grierson [113]
1903-28: 2; Bareh 1962.]

thereafter, the British negotiated treaties with all the Khasi states, the last treaty being signed in 1862. It was contracted that the chiefs would be subject to the authority of a resident political agent, whose duties would involve maintaining law and order, judging cases of heinous crimes, approving the popular selection of any new chief, and exercising control over certain categories of natural resources. Khasis were guaranteed noninterference in their customary way of life, and they were not then, nor are they now, taxed. Most Khasis, as opposed to Jaintias, were never an integral part of British India, but they did undergo social change as a result of British presence. To summarize Mills (n.d.): (1) The British introduced the potato, which the Khasis rapidly took up as a cash crop for marketing as far as Calcutta. The intensive specialization exhausted the soil and made for ever-poorer crops. (2) Christian missionaries made large numbers of converts, and there arose the difficult question of whether a Christian should inherit property that traditionally was earmarked for her performance of non-Christian religious rituals. (3) About 1864 the British transferred their headquarters from Cherrapunji to Shillong. When they made Shillong the capital of the entire state of Assam, non-Khasis flocked to it, land values soared, and the concept of private property became increasingly important. Khasis began to marry with members of other ethnic groups, which introduced confusion into traditional social patterns. These problems were exacerbated during World War II, when Shillong and its environs enjoyed enormous economic prosperity. One notable aftermath of this affluence has been the accelerated enrollments in schools and colleges. Hundreds of Khasis now have the B.A., M.A., and even the Ph.D. degree. • With the Independence of India in 1947, and under the Sixth Schedule of the Constitution of India (which was drafted by a Khasi), the United Khasi–Jaintia Hills District became a Part B, or Autonomous, Tribal Area, to be governed by a District Council composed largely of Khasis and Jaintias, and responsible not to the Legislature of Assam, but to the Governor of Assam as agent of the President of India. The native-state system and the chiefs still exist, and the District Council finds it difficult to effect legislation which is neither offensive to regional custom nor a simple blueprint of ill-fitting all-India legislation. The major political schism at this time is between Jaintias, who are accustomed to centralized authority and taxation, and Khasis, who resist the notion of taxation to support the work of a central District Council. [Cf. Gait 1926; Aitchison 1931; Bhuyan 1949; Morris 1910.]

175 619 648 [726] [651] [177] 177 648 244 439 134 797 428 635 633 167 563 423 [873] 648 642 [651] [563] [113]

SETTLEMENT PATTERN AND HOUSING. **Settlement pattern.** Khasis live sedentarily in named, nucleated, and unplanned villages which are situated just below hill summits to avoid strong winds but still be defensible, and which usually include a de-

361 [312]

says that the MoBrCh but not the FaSiCh is prohibited (1897: 2), but Gurdon says that the MoBrCh is eligible after the death of MoBr, and that FaSiCh is eligible after the death of Fa (1907: 78). Nowadays both types of marriage occur, whether the linking relative is living or dead. **Residence.** Residence is either duolocal or matrilocal under the roof of the wife's mother until the birth of one or two children. For a man married to a youngest daughter, it then continues to be matrilocal. For men married to other daughters, it becomes uxorilocal; there have also always been cases of virilocal residence, and it is now common to find neolocal residence in Shillong. For non-Christian Jaintias, it is duolocal throughout the marriage. **Domestic unit.** The domestic unit is the elementary family, though for a youngest daughter it may temporarily include also her aged mother, aged father, unmarried siblings, or divorced or widowed brothers. **Inheritance.** Traditionally, after the Khasi mother had helped each of her daughters to build and supply a house when each one married and had children, her only real obligation to help them economically was ended. Everything she possessed, excepting certain personalty that was destroyed in her cremation, was inherited by her youngest daughter. Failing daughters, a woman's property reverted to her next youngest sister's daughter. Today, this pattern is often modified by putting more property into the hands of older daughters and even sons. [Cf. Cantlie 1934; Becker 1924.] **Divorce.** A woman may effect numerous and usually brief separations from her husband by simply closing the door of her house to him, whereupon he returns to the house of his mother or youngest sister. Divorce, however, must be initiated by mutual consent. Divorce is very common, even though women resist it because they do not wish to lose a provider, and men because they do not wish to lose their children. Formerly it was accomplished by a simple ritual in the presence of witnesses, followed by public announcement by a town crier. Now, the witnesses and the public announcement have been dispensed with, and evidence for divorce consists only in the word of the parties concerned.

835 [114] [178] 591 592 428 [178] 586 586 178

SOCIOPOLITICAL ORGANIZATION. **Political organization.** The basic unit of political organization is the village, which is composed of one or more dominant local descent groups plus several others. Village government is by an assembly of all resident adult males, under the informal chairmanship of a headman elected by them from among their number. The membership of any immigrant household into a village is defined by the participation of the household's males in this assembly. Sustained membership in a village is voluntary. Khasi chiefdoms probably arose out of voluntary associations of villages, which occasionally transferred allegiance from one chief to another.

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

strip of fine silk for the loins, a part of which hangs gracefully as low as the calves in front. No notice is here taken of what has undoubtedly been added and borrowed from their more civilised neighbours in the plains. 291

'MARRIAGE.—The marriageable age for females is from 15 to 18; for males, from 18 to 24. Matrimonial alliances are contracted either through the parents or the living representatives of the families to which the parties belong. The mode of procedure is still very primitive and unceremonious. The bridegroom, escorted by a number of friends and relatives, goes to the house of the bride, where all are feasted and lodged for the night; on the morrow he leads the bride, accompanied by a number of her relatives, to his own house, and entertains the company with dishes of boiled rice and fresh pork. After remaining there a day or two, the newly-married couple return together to the house of the wife, which becomes their future home. Marriage is dissoluble by regular divorce, for any sufficient cause, and often without any assignable reason except mutual dislike or want of issue, the latter being the most common case of all. Marriage with the Khásiás is simply a conventional arrangement, with nothing further for its object than the procreation of children; failing that, it is no longer looked upon as a contract permanently binding. Divorce is effected in the presence of eye-witnesses—the parents, or the heads of clans. Five cowries (*kauris*) are produced by the parties and exchanged, then cast away by mutual consent, and the ceremony is over. Parties once divorced can never again contract marriage with each other, but they are at liberty to marry into other families. Polygamy, strictly so called, is not sanctioned by Khásí custom. Adultery is looked upon as a serious crime. If the five cowries have not been cast away by mutual consent, both husband and wife are held to be subject to the "matrimonial demon;" and even when either dies in wedlock, the survivor is not at liberty to contract a fresh alliance until he or she pays the family a sum of money as the means of removing the surviving party from subjection to the "matrimonial demon." The husband is a stranger, so to speak, in the family he has entered, and perpetuates the race of others, not his own. The children in all questions of lineage and personal rights follow the mother. There are always two interests in the same family—that of the husband, and that of the wife. Whatever the husband may have earned or acquired in

58 591 586 [581] 587 595 837 587 593 611 593 428

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

593 wedlock goes to the wife and becomes her property; but all other
• 428 property is inalienable, and reverts to his family, as also does his corpse after death.

771 'RELIGION.—The religion of the Khásiás is demon-worship, or a jumble of enchantments muttered by priests who are sorcerers. They invoke evil spirits as the deputies of God and the instruments
775 of His pleasure or displeasure. The Khásiás believe in metempsychosis, or the transmigration of souls. After death, human beings are transformed into monkeys, crabs, tortoises, frogs, etc. Though a future state is not denied, it is treated with absolute indifference, as beyond the sphere of responsibility; all rites, ceremonies, and observances bear reference to the welfare of mankind in this world. The spirits of their departed relatives and ancestors are invoked only in so far as they are considered to influence and have power
764 over the present life. The Khásiás burn their dead, and collect the ashes into urns, which are kept under a slab raised on four others enclosing a space. These monuments are of various kinds and sizes —one for individuals, another for a family, and another for a whole
614 clan. There is no caste system, but each clan is called after some object of nature, as the Oak clan, the Crab clan, etc., and these names entail certain restrictions beyond which intermarriage is
771 forbidden. The Khási religion may be briefly described as the practice of forms to cure diseases, and to avert misfortunes of all kinds, by means of ascertaining the name of the demon who is the author of the evil, and the kind of sacrifice necessary to appease it.

797 'CHRISTIANITY.—The Welsh Mission has been labouring amongst the Khásiás and Syntengs for thirty-two years. The Christians number about 1000 [according to the Census of 1872, the total number of native converts in the District is only 85]. There are four central stations—Cherrá, Shellá, Shillong, and Jowái —and twenty-three churches. Translations of the whole of the New Testament, and a portion of the Old, are now (1876) going to press, besides other religious books.

197 'LANGUAGE.—The definitions generally given of monosyllabic
193 languages are far from adequate to enable us to assign to the Khási tongue its position amongst the Indo-Chinese family of speech. Still, in the absence of a better terminology, it may be described as monosyllabic in the agglutinative stage. The monosyllabic element greatly predominates. By far the larger number of the compounds are mere agglutinations (in a modified

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

sense) or juxtapositions of roots which have not thereby suffered 197
either obscuration or absorption—that is to say, they are all, 193
with a few exceptions, reducible to their constituent root words, which are still "current coin," and retain their power as independent vocables. The cases in which obscuration and "fusion" of roots have taken place are confined to—(1) the noun prefix *jong*, expressing abstract ideas; (2) the verbal prefixes *byn*, *kyn*, *lyn*, *ryn*, *syn*, *tyn*, *pyn*, *byr*, *kyr*, *lyr*, *pyr*, *syr*, *tyr*, expressing causation, intensification, and contrariety. The language is found purest at Cherrá Púnjí. The Khásiás have no written character or literature of 212
any kind of their own. Tradition says that all was lost while they 173
were yet masters of the plains, whence they were driven by a general catastrophe or deluge to their present fastnesses in the hills. The following works on the language have been published: *Khási* 113
Grammar, *Anglo-Khási Dictionary*, *Khási Primer* (Parts I. and II., with Vocabulary),—all issued by the Calcutta School-Book Society; *Khási English Dictionary* (in preparation), and an *Anglo-Khási First Book*.

'CUSTOMS REGARDING INHERITANCE.—A Khásiá, whether married 428
or single, if he makes his mother's house his home, is said to be earning for his *kur*, *i.e.* for his mother, or his brothers and sisters, or his mother's relatives. On his death his property goes to his mother, if living; if not, to the grandmother; if she is not living, then to his sisters; should his sisters also be dead, to his sisters' children. Should the deceased have left no sisters, the property goes to the brothers; should he have no brothers or should they be dead, the property descends to his aunts, or to their children if the aunts are not living; should the aunts have left no children, the property descends to the grandmother's or great-grandmother's sisters or children. The property of a female on her death goes to her mother, if the deceased have no children; or if the mother of the deceased is not living, the property goes to the brothers and sisters; if the sisters are dead, then their children become the heirs. If there are no such children, the property devolves as in the case of males. When a man is not living in his mother's house, but in that of his wife, he earns for his wife and children. On his death his property descends to his wife, with the exception of the ornaments and clothing worn by him during his lifetime, which go to the brothers and sisters or other relatives of the deceased. Should the deceased have been a widower, the property goes to his children, and in their absence

20: Hunter G-4 (no date) 1897 AR7 Khasi AR7

428 to the sisters of his wife, or to her nearest relatives if there are no sisters. The rank and titles of a deceased male descend to his brother; when no brother exists, then to the male children of his mother's sisters (maternal aunts); should the maternal aunts have no male children living at the time, then to the eldest male child of his sisters. When no relatives are to be found, the property of the deceased goes to the ruler of the country; or if a man dies leaving no relative other than wife and children, *i.e.* no relatives on the mother's side, the property in this case also goes to the ruler, who, as the wife and children cannot preserve the ashes of the deceased, takes charge of them, and for so doing takes all the property also. With regard to the inhabitants of the Lower Hills at Shellá, the custom as to succession is as follows:—Property belonging to a subject of Shellá is divided into two classes—(1) Property inherited from ancestors, which descends to the nearest of kin or to the relative of a deceased person who can perform his obsequies. (2) Property acquired during the lifetime of the holder, which is inherited by the children, whose duty it is to provide for the maintenance of their mother until she re-marries or dies.'

434 465 MATERIAL CONDITION OF THE PEOPLE.—The Khásiás and the Syntengs are as a people prosperous. Common labourers, if adult males, can earn wages as high as one shilling per diem, and adult 342 females as high as eightpence. The dwellings of the well-to-do classes are generally constructed of masonry, with thatched roof and 352 plank floor, and divided into two or three rooms. The furniture consists of a bedstead (*charpái*), a seat or two (*mora*), some cooking utensils, and a few boxes. The ordinary peasants and poorer 342 classes construct their huts of stone, mud, or plank walls, with a 184 thatch or cane roof. These are fitted with wooden platforms or loose planks placed on the ground to serve as beds. The food 262 of the well-to-do classes consists of rice, fish when obtainable, fowl 434 or meat, curry, vegetables, oil, hog's lard, fermented and spirituous liquor. It may be estimated that the living expenses of an average-sized household of this class would be about Rs. 25 or £2, 10s. a month, valuing the articles of consumption at *bázár* prices. An ordinary husbandman or labourer lives on rice, dry fish, occasionally a 276 little meat, oil, or hog's lard. *Pán* leaf, betel-nut, and lime are essential to the comfort of all the hill people, who are inveterate chewers of *pán*. They commence at an early age, and are rarely seen without a *pán* leaf in their mouths; the females are quite

21: Ehrenfels E-4,5 (1950) 1953 AR7 Khasi AR7

III. Explanations

1. General

124 128 601 Most of my informants were illiterate. The spelling of the terms was checked and corrected by my English-speaking and writing Khasi- and Pnar- friends, mentioned in para one, to whom thanks are being here once more expressed. All responsibility for spelling mistakes, however, which may have slipped into this list has of course to be borne by me.

Blanks (—) or question marks (?) in one of the columns do not necessarily mean that there is no word used, by the respective group, for the particular term. They more often indicate that my informants did not use, or know, the particular term, or that I failed to enquire about it in a [114] manner sufficiently clear to my informants. This is particularly true of general terms, partly or fully corresponding to English general terms, such as parents or grand-parents, or the terms No. 9/a and b, 13, 15/a, 19-21, and 26, which were partly explained to me, by Khasi friends in Shillong, where I stayed some time after completion of field-work during the rainy season. Hence I could no more return for verification to the little accessible War-villages in the steep southern slopes. Although I am planning to utilise a future opportunity for such checking up, I am yet publishing the present results in the hope that they may thus become accessible to field-workers among other S. E.-Asiatic, and especially Austro-Asiatic speaking peoples.

193 601 128 All terms which are equal for both sexes (cf. Nos. 10, 11, 18, 19, etc.) are used with *ka* and *u* respectively. These sex-determining prepaced articles, as also the honorific *i* are specially mentioned in the list, only if this is essential for the understanding of the respective terms as in Nos. 3-5, 7, 8, or 10.

2. Special

601 Term No. 1 — to give birth or beget (*kha*) signifies also relatives on the paternal side as in *pawa kha* (paternal cousins No. 9/c), in contradistinction to *pawa kur*, 9/b, (lit. : cousins of the clan), i. e. maternal cousins, since the clan is a matrilineal unit. This usage of the word *kha* appears also [842] significantly in the terms 15/a, 17, 19/b, 20, 22, 32 and, as an integral part of the Khasi kinship terminology, renders it highly improbable that the Khasi matrilineal system could have originated in ignorance of the biological function of the father. It is a significant feature in the matrilineal social system.

The terms 3 to 3/b refer to unmarried but biologically marriageable youths. [881] It will be noted that there are (and were in 1954) no indications of puberty-[584] rites for either girls or boys. There is also no child-marriage among Khasi. The use of special terms for mature, unmarried youths is therefore significant.

Term 6 — *i* as honorific article, is at the same time indicative of [428] diminution [*], which is remarkable for two reasons: (firstly) the diminution is used for the oldest and most respected family members, like the diminution

[*] Nissen Sonoo (1956), p. 86.

21: Khrenfele E-4,5 (1950) 1953 AR7 Khasi AR7

of father in Russian (for the *tsar*, etc.), (secondly) the youngest, not the oldest, daughter performs the family rites and inherits the family-property [28]. Even in cases when there is no woman to inherit, the youngest, not the oldest son inherits [29]. Among the conservatively matrilineal Pnar (Jaintia) this term of diminution *i*, however, carries at times a somewhat contemptuous meaning, though the minorate is strongly in force also among them. The ambivalent position of this honorific term of diminution is thus significant (comp. term 9/*e* among Pnar and infra.) 601 [428] [196]

Term 7 — mother: (*i mai*) — The prefix *i* used among Khasi and War Khasi signifies particular reverence (supra: term 6). The classificatory character of the term has been discussed by CHATTOPADHYAY [30]. [193]

Term 9/*f* — *hep* for all younger siblings, cousins and even other young folk does not indicate the consideration which the terms 9/*d* — *hong* for older sisters and female cousins, or 9/*e* — *hah* for their male equivalents indicate. The term *saw* (9/*c* among Pnar) stands here, as generally, for elder and implies a honorific meaning (comp. term 6 supra and term 13/*a* infra).

Terms 10/*a* and *b* show that husband and wife address each other by equal terms and do in no way indicate anything like an inferior position of either wives or husbands of which I did also not find any indications otherwise. It may here be mentioned that property rights even in newly established estates, vest in women and are inherited by women, — not generally men. 601 562

Term 11/*d* — *ka khun khaddah* — the youngest daughter whose important position in Khasi religious ritual, social organization and inheritance law has already been referred to sub term 6 and described in detail elsewhere [31]. The affectionate character of this term finds vivid expression in the abbreviation *ka dah*, which I heard from sisters and the father of a youngest daughter. 601 [593]

Term 13/*a* — *mei saw* (mother's older sister). The word *saw* (older) here has a definitely honorific character, although the *mei khyawah* — the mother's younger sister (term 13/*b*) may be the heir of Ego's ancestral property. This constellation corresponds to the peculiar significance of terms 6, 9/*d* and especially 11/*d* (supra).

Terms 13, 14, 15/*a*, 16, 18/*a*, 19/*b*, and the terms for cousins 10, 20, 21/*a*, 21/*b*, 22 show, like term 7 — mother (supra), classificatory character. The restriction on cross-cousin marriage is of different nature, according as to whether they belong to different households, or not, as has been discussed by CHATTOPADHYAY [32]. [582]

Term 16/*a* — *dia* (mother's brother's wife) is basically the same as term 15 — *dia kha* (father's sister) [33] though the latter is qualified by the additional term *kha*: (begotting, birth) which signifies paternal relationship (see: term No. 1).

[31] GURDON (1914), pp. 83, seq. and CARTLIE (1934), pp. 11, seq.
[32] CHATTOPADHYAY (1941), pp. 36, seq.
[33] In detail discussed by CHATTOPADHYAY (1941), p. 37.

she does not have any daughter, the property will pass to the female descendants of sisters of Ka Long, as her elder sisters Ka Laimon and Ka Laiban have left no daughters. It is therefore necessary to distinguish carefully between an elder and a younger sister, and also similarly between sisters of the mother. The genealogy of the women of the same house and extended family requires to be noted with care.

The youngest daughter and heiress is termed the Ka Khadduh. As Gurdon remarks the "Ka Khadduh is the custodian of the family property, not the full heir in the sense known to other systems of law, but a limited heir. She is responsible for the performance of religious ceremonies.....; she cremates her mother, and if she be Ka Khadduh of the whole family, she puts the bones of all members in their final resting place under the stone (mawbah) of the clan. The expenses of this ceremony are considerable and for this reason she gets a larger share of property, or in some cases a piece of family property in addition and apart from her separate share. Members of the family who are unable to earn for themselves and have no children to earn for them have the right of being fed at the ing-Khadduh" (house of the heiress).

The management of the property is however vested in the men of the family. The ancestral property of the family of myself U Subu Rai's mother was under the management of U Joi, in his mother's life-time; then, on the death U Joi, the next brother U Doi became manager. After U Doi, the management came to U Subu Roi. After him, the authority will pass to U Hajon, as U Sumbarai is dead and then to U Nobon. Any sons of Ka Pyon and other sisters will not get any precedence over U Nobon. As the senior U Kai of the Iangbiah Kur, U Subu Roi is also the manager of the common property of the Kur. This land has been leased out to various persons and the total income is divided among the different houses of the Kur. Whenever there is money to be distributed U Subu Rai calls together all the representatives of the Iangbiah houses and

divides equally. U Subu Rai explained that each house counted as a separate unit. Thus if Ka Jem, Ka Jin and all their daughters were alive, the married daughters who lived in a separate house, namely, Ka Laimoo, Ka Laibon, Ka Aimon and Ka Hoimon of Ka Jem's house, and Ka Phre of Ka Jin's line, would each get a share. But Ka Jem and her Ka Khadduh Ka Aiben who lives in the mother's house would get only one share. So would Ka Jin, Ka Kiriben and the unmarried daughters of the latter. The descendants of Ka Lung would get seven equal shares for distribution to each house, and not two shares first, divided later into shares corresponding to the number of daughters for Ka Jem's and Ka Jin's house. The *manager does not get any share of the collections.* Authority in the management of the ancestral property therefore passes from one male to another, in the extended family, and the Kur, in a manner which necessitates a clear distinction of seniority and juniority of brothers, among themselves and also of sisters with regard to brothers. 421 [429] [428]

The case of succession is similar. Gordon notes that the Siemship in Mylliem State passes from a man to his next brother, and "failing such brothers, by the eldest of his sisters' sons; failing such nephews by the eldest of the sons of his sisters' daughters; failing such grand nephews by the eldest of the sons of his mother's sisters" and so forth in the female line. In Nongkrem, the son or similar male relative of the High Priestess becomes by delegation a Siem. The office of the High Priestess passes from a woman to her eldest surviving daughter; and failing daughters to the eldest daughter of her eldest daughter; failing daughters of her eldest daughter, to the eldest daughter of her second daughter, and so on. This is the customary line of succession, and is stated by Gordon to be "uniform in all cases" practically. 428 793 443

Neither levirate, nor sororate are practised by the Khasis. Widows are stated (5) quite often not to remarry if there are daughters. There is no question of the control of the property 537 421

19: Assam G-5 (1958) 1963 AR7 Khasi AR7

REPORT ON RURAL ECONOMIC SURVEY IN UNITED KHASI-JAINTIA HILLS.

CHAPTER I

Introduction

1.1 Objective.—Consequent upon restrictions on trade emerging in the border markets after partition, the economic condition of the people living in the border areas of the United Khasi-Jaintia Hills district adjoining East Pakistan, suffered a serious set back. There was demand from the people all over the border areas for adequate relief as well as rehabilitation of their shattered economy. From time to time Government took up various relief measures but, for adopting a planned programme of relief and rehabilitation in an integrated and sustained manner, the need for a comprehensive economic survey of the district with special emphasis on the border areas, came to the forefront. Accordingly at the instance of Government of Assam, the Department of Economics and Statistics addressed itself to the task of launching an economic survey in the district.

43 648 65

The programme consisted of an intensive study of the conditions in selected villages and was designed to meet the following objectives:— (I) To obtain a broad picture of the rural economic conditions in the district and in particular, to provide factual data on the various aspects of agriculture and farm economics, *e. g.*, land tenure, size and distribution of agricultural holdings and farms, fragmentation, income and expenditures occupation and the like. Data should be collected also on the occupations and industries which play subsidiary roles in the economy of the district. (II) Special emphasis need be given on border areas, in order to bring to light the measure of suffering of the border people as a result of partition and to suggest various long and short term measures for ameliorating the condition of the border people. (III) The survey should adequately cover the Community Development areas also in order that it becomes possible to make an assessment of the impact of the community development programmes on the socio-economic life of the people in these areas.

12 654

1.2 Coverage and Period.—The field work of the survey was started on 23th February, 1958 and was completed by the middle of July, 1958 thus requiring nearly four and a half months.
